20-Pin Flash-Based 8-Bit
CMOS Microcontroller with
Two-Phase Asychronous Feedback PWM,
Dual High-Speed Comparators and
Dual Operational Amplifiers

**Preliminary**

**Note the following details of the code protection feature on Microchip devices:**

- Microchip products meet the specification contained in their particular Microchip Data Sheet.

- Microchip believes that its family of products is one of the most secure families of its kind on the market today, when used in the intended manner and under normal conditions.

- There are dishonest and possibly illegal methods used to breach the code protection feature. All of these methods, to our knowledge, require using the Microchip products in a manner outside the operating specifications contained in Microchip's Data Sheets. Most likely, the person doing so is engaged in theft of intellectual property.

- Microchip is willing to work with the customer who is concerned about the integrity of their code.

- Neither Microchip nor any other semiconductor manufacturer can guarantee the security of their code. Code protection does not mean that we are guaranteeing the product as "unbreakable."

Code protection is constantly evolving. We at Microchip are committed to continuously improving the code protection features of our products. Attempts to break Microchip's code protection feature may be a violation of the Digital Millennium Copyright Act. If such acts allow unauthorized access to your software or other copyrighted work, you may have a right to sue for relief under that Act.

**Trademarks**

The Microchip name and logo, the Microchip logo, Accuron, dsPIC, KEELOQ, microID, MPLAB, PIC, PICmicro, PICSTART, PRO MATE, PowerSmart, rfPIC, and SmartShunt are registered trademarks of Microchip Technology Incorporated in the U.S.A. and other countries.

AmpLab, FilterLab, MXDEV, MXLAB, PICMASTER, SEEVAL, SmartSensor and The Embedded Control Solutions Company are registered trademarks of Microchip Technology Incorporated in the U.S.A.

Analog-for-the-Digital Age, Application Maestro, dsPICDEM, dsPICDEM.net, dsPICworks, ECAN, ECONOMONITOR, FanSense, FlexROM, fuzzyLAB, In-Circuit Serial Programming, ICSP, ICEPIC, Migratable Memory, MPASM, MPLIB, MPLINK, MPSIM, PICkit, PICDEM, PICDEM.net, PICLAB, PICtail, PowerCal, PowerInfo, PowerMate, PowerTool, rfLAB, rfPICDEM, Select Mode, Smart Serial, SmartTel and Total Endurance are trademarks of Microchip Technology Incorporated in the U.S.A. and other countries.

SQTP is a service mark of Microchip Technology Incorporated in the U.S.A.

All other trademarks mentioned herein are property of their respective companies.

QUALITY MANAGEMENT SYSTEM
CERTIFIED BY DNV
ISO/TS 16949:2002

*Microchip received ISO/TS-16949:2002 quality system certification for its worldwide headquarters, design and wafer fabrication facilities in Chandler and Tempe, Arizona and Mountain View, California in October 2003. The Company's quality system processes and procedures are for its PICmicro® 8-bit MCUs, KEELOQ® code hopping devices, Serial EEPROMs, microperipherals, nonvolatile memory and analog products. In addition, Microchip's quality system for the design and manufacture of development systems is ISO 9001:2000 certified.*

# PIC16F785

## 20-Pin Flash-Based 8-Bit CMOS Microcontroller

### High-Performance RISC CPU

- Only 35 instructions to learn:
  - All single-cycle instructions except branches
- Operating speed:
  - DC – 20 MHz oscillator/clock input
  - DC – 200 ns instruction cycle
- Interrupt capability
- 8-level deep hardware stack
- Direct, Indirect and Relative Addressing modes

### Special Microcontroller Features

- Precision Internal Oscillator:
  - Factory calibrated to ±1%
  - Software selectable frequency range of 8 MHz to 32 kHz
  - Software tunable
  - Two-Speed Start-up mode
  - Crystal fail detect for critical applications
  - Clock mode switching during operation for power savings
- Power-saving Sleep mode
- Wide operating voltage range (2.0V-5.5V)
- Industrial and Extended temperature range
- Power-on Reset (POR)
- Power-up Timer (PWRT) and Oscillator Start-up Timer (OST)
- Brown-out Reset (BOR) with software control option
- Enhanced Low-Current Watchdog Timer (WDT) with on-chip oscillator (software selectable nominal 268 seconds with full prescaler) with software enable
- Multiplexed Master Clear with pull-up/input pin
- Programmable code protection
- High-Endurance Flash/EEPROM cell:
  - 100,000 write Flash endurance
  - 1,000,000 write EEPROM endurance
  - Flash/Data EEPROM retention: > 40 years

### Low-Power Features

- Standby Current:
  - 30 nA @ 2.0V, typical
- Operating Current:
  - 8.5 µA @ 32 kHz, 2.0V, typical
  - 100 µA @ 1 MHz, 2.0V, typical
- Watchdog Timer Current:
  - 1 µA @ 2.0V, typical
- Timer1 Oscillator Current:
  - 2 µA @ 32 kHz, 2.0V, typical

### Peripheral Features

- High-speed Comparator module with:
  - Two independent analog comparators
  - Programmable on-chip voltage reference ($CV_{REF}$) module (% of $V_{DD}$)
  - 1.2V band gap reference
  - Comparator inputs and outputs externally accessible
  - < 40 ns propagation delay
  - 2 mv offset, typical
- Operational amplifier module with 2 independent op amps:
  - 3 MHz GBWP, typical
  - All I/O pins externally accessible
- Two-Phase Asychronous Feedback PWM module:
  - Complementary output with programmable overlap/dead band delay
  - Infinite resolution analog duty cycle
  - Sync Output/Input for multi-phase PWM
  - $F_{OSC}/2$ maximum PWM frequency
- A/D Converter:
  - 10-bit resolution and 14 channels (2 internal)
- 17 I/O pins and 1 input-only pin:
  - High-current source/sink for direct LED drive
  - Interrupt-on-pin change
  - Individually programmable weak pull-ups
- Timer0: 8-bit timer/counter with 8-bit programmable prescaler
- Enhanced Timer1:
  - 16-bit timer/counter with prescaler
  - External Gate Input mode
  - Option to use OSC1 and OSC2 in LP mode as Timer1 oscillator, if INTOSC mode selected
- Timer2: 8-bit timer/counter with 8-bit period register, prescaler and postscaler
- Capture, Compare, PWM module:
  - 16-bit Capture, max resolution 12.5 ns
  - Compare, max resolution 200 ns
  - 10-bit PWM with 1 output channel, max frequency 20 kHz
- In-Circuit Serial Programming™ (ICSP™) via two pins

## TO OUR VALUED CUSTOMERS

It is our intention to provide our valued customers with the best documentation possible to ensure successful use of your Microchip products. To this end, we will continue to improve our publications to better suit your needs. Our publications will be refined and enhanced as new volumes and updates are introduced.

If you have any questions or comments regarding this publication, please contact the Marketing Communications Department via E-mail at **docerrors@mail.microchip.com** or fax the **Reader Response Form** in the back of this data sheet to (480) 792-4150. We welcome your feedback.

### Most Current Data Sheet

To obtain the most up-to-date version of this data sheet, please register at our Worldwide Web site at:

   http://www.microchip.com

You can determine the version of a data sheet by examining its literature number found on the bottom outside corner of any page. The last character of the literature number is the version number, (e.g., DS30000A is version A of document DS30000).

### Errata

An errata sheet, describing minor operational differences from the data sheet and recommended workarounds, may exist for current devices. As device/documentation issues become known to us, we will publish an errata sheet. The errata will specify the revision of silicon and revision of document to which it applies.

To determine if an errata sheet exists for a particular device, please check with one of the following:

• Microchip's Worldwide Web site; http://www.microchip.com
• Your local Microchip sales office (see last page)
• The Microchip Corporate Literature Center; U.S. FAX: (480) 792-7277

When contacting a sales office or the literature center, please specify which device, revision of silicon and data sheet (include literature number) you are using.

### Customer Notification System

Register on our web site at **www.microchip.com/cn** to receive the most current information on all of our products.

**NOTES:**

## 1.0 DEVICE OVERVIEW

This document contains device specific information for the PIC16F785. Additional information may be found in the *PICmicro® Mid-Range Reference Manual* (DS33023), which may be obtained from your local Microchip Sales Representative or downloaded from the Microchip web site. The Reference Manual should be considered a complementary document to this Data Sheet and is highly recommended reading for a better understanding of the device architecture and operation of the peripheral modules.

The PIC16F785 is covered by this Data Sheet. It is available in 20-pin PDIP, SOIC and SSOP packages. Figure 1-1 shows a block diagram of the PIC16F785 device. Table 1-1 shows the pinout description.

**FIGURE 1-1:       PIC16F785 BLOCK DIAGRAM**
# PIC16F785

**TABLE 1-1: PIC16F785 PINOUT DESCRIPTION**

| Name | Pin | Function | Input Type | Output Type | Description |

**NOTES:**

**Preliminary**

## 2.0 MEMORY ORGANIZATION

### 2.1 Program Memory Organization

The PIC16F785 has a 13-bit program counter capable of addressing an 8k x 14 program memory space. Only the first 2k x 14 (0000h–07FFh) for the PIC16F785 is physically implemented. Accessing a location above these boundaries will cause a wrap around within the first 2k x 14 space. The Reset vector is at 0000h and the interrupt vector is at 0004h (see Figure 2-1).

**FIGURE 2-1: PROGRAM MEMORY MAP AND STACK FOR THE PIC16F785**

### 2.2 Data Memory Organization

The data memory (see Figure 2-2) is partitioned into four banks, which contain the General Purpose Registers (GPR) and the Special Function Registers (SFR). The Special Function Registers are located in the first 32 locations of each bank. Register locations 20h – 7Fh in Bank 0 and A0h – BFh in Bank 1 are General Purpose Registers, implemented as static RAM. The last sixteen register locations in Bank 1 (F0h – FFh), Bank 2 (170h – 17Fh), and Bank 3 (1F0h – 1FFh) point to addresses 70h – 7Fh in Bank 0. All other RAM is unimplemented and returns '0' when read.

Seven address bits are required to access any location in a data memory bank. Two additional bits are required to access the four banks. When data memory is accessed directly, the seven least significant address bits are contained within the opcode and the two most significant bits are contained in the Status register. RP0 and RP1 (Status<5> and Status<6>) are the two most significant data memory address bits and are also known as the bank select bits. Table 2-1 lists how to access the four banks of registers.

**TABLE 2-1: BANK SELECTION**

|       | RP1 | RP0 |
|-------|-----|-----|
| Bank0 | 0   | 0   |
| Bank1 | 0   | 1   |
| Bank2 | 1   | 0   |
| Bank3 | 1   | 1   |

#### 2.2.1 GENERAL PURPOSE REGISTER FILE

The register file banks are organized as 128 x 8 in the PIC16F785. Each register is accessed, either directly, by seven address bits within the opcode, or indirectly, through the File Select Register, FSR. When the FSR is used to access data memory, the eight least significant data memory address bits are contained in the FSR and the ninth most significant address bit is contained in the IRP bit (Status<7>) of the Status register. (See **Section 2.4 "Indirect Addressing, INDF and FSR Registers"**).

#### 2.2.2 SPECIAL FUNCTION REGISTERS

The Special Function Registers are registers used by the CPU and peripheral functions for controlling the desired operation of the device (see Table 2-2). These registers are static RAM.

The special registers can be classified into two sets: core and peripheral. The Special Function Registers associated with the "core" are described in this section. Those related to the operation of the peripheral features are described in the section of that peripheral feature.

*Preliminary*

### 2.2.2.1    Status Register

The Status register, shown in Register 2-1, contains:

- the arithmetic status of the ALU
- the Reset status
- the bank select bits for data memory (SRAM)

The Status register can be the destination for any instruction, like any other register. If the Status register is the destination for an instruction that affects the Z, DC or C bits, then the write to these three bits is disabled. These bits are set or cleared according to the device logic. Furthermore, the TO and PD bits are not writable. Therefore, the result of an instruction with the Status register as destination may be different than intended.

For example, CLRF STATUS will clear the upper three bits and set the Z bit. This leaves the Status register as 000u u1uu (where u = unchanged).

It is recommended, therefore, that only BCF, BSF, SWAPF and MOVWF instructions are used to alter the Status register, because these instructions do not affect any Status bits. For other instructions not affecting any Status bits, see the "Instruction Set Summary".

> **Note:**   The C and DC bits operate as a Borrow and Digit Borrow out bit, respectively, in subtraction. See the SUBLW and SUBWF instructions for examples.

**REGISTER 2-1:    STATUS — STATUS REGISTER (ADDRESS: 03h OR 83h)**

| R/W-0 | R/W-0 | R/W-0 | R-1 | R-1 | R/W-x | R/W-x | R/W-x |
|-------|-------|-------|-----|-----|-------|-------|-------|
| IRP | RP1 | RP0 | TO | PD | Z | DC | C |

bit 7                                                                                                          bit 0

bit 7       **IRP:** Register bank select bit (used for indirect addressing)
1 = Bank 2,3 (100h – 1FFh)
0 = Bank 0,1 (00h – FFh)

bit 6-5     **RP1:RP0:** Register Bank Select bits (used for direct addressing)
11 = Bank 3 (180h – 1FFh)
10 = Bank 2 (100h – 17Fh)
01 = Bank 1 (80h – FFh)
00 = Bank 0 (00h – 7Fh)

bit 4       **TO:** Time-out bit
1 = After power-up, CLRWDT instruction, or SLEEP instruction
0 = A WDT time-out occurred

bit 3       **PD:** Power-down bit
1 = After power-up or by the CLRWDT instruction
0 = By execution of the SLEEP instruction

bit 2       **Z:** Zero bit
1 = The result of an arithmetic or logic operation is zero
0 = The result of an arithmetic or logic operation is not zero

bit 1       **DC:** Digit Carry/Borrow bit (ADDWF, ADDLW, SUBLW, SUBWF instructions)**(1)**
For borrow, the polarity is reversed.
1 = A carry-out from the 4th low-order bit of the result occurred
0 = No carry-out from the 4th low-order bit of the result

bit 0       **C:** Carry/Borrow bit (ADDWF, ADDLW, SUBLW, SUBWF instructions)**(1)**
1 = A carry-out from the Most Significant bit of the result occurred
0 = No carry-out from the Most Significant bit of the result occurred

Note  1:   For Borrow, the polarity is reversed. A subtraction is executed by adding the two's complement of the second operand. For rotate (RRF, RLF) instructions, this bit is loaded with either the high-order or low-order bit of the source register.

| **Legend:** | | |
|---|---|---|
| R = Readable bit | W = Writable bit | U = Unimplemented bit, read as '0' |
| - n = Value at POR | '1' = Bit is set | '0' = Bit is cleared    x = Bit is unknown |

---

### 2.2.2.2 OPTION Register

The OPTION register is a readable and writable register, which contains various control bits to configure:

• TMR0/WDT prescaler
• External RA2/INT interrupt
• TMR0
• Weak pull-ups on PORTA

| Note: | To achieve a 1:1 prescaler assignment for TMR0, assign the prescaler to the WDT by setting PSA bit to '1' (OPTION_REG<3>). See **Section 5.4 "Prescaler"**. |
|---|---|

**REGISTER 2-2:**     **OPTION_REG — OPTION REGISTER (ADDRESS: 81h)**

| R/W-1 | R/W-1 | R/W-1 | R/W-1 | R/W-1 | R/W-1 | R/W-1 | R/W-1 |
|---|---|---|---|---|---|---|---|
| $\overline{\text{RAPU}}$ | INTEDG | T0CS | T0SE | PSA | PS2 | PS1 | PS0 |

bit 7                               bit 0

bit 7      **$\overline{\text{RAPU}}$:** PORTA Pull-up Enable bit
           1 = PORTA pull-ups are disabled
           0 = PORTA pull-ups are enabled by individual port latch values in WPUA register

bit 6      **INTEDG:** Interrupt Edge Select bit
           1 = Interrupt on rising edge of RA2/AN2/T0CKI/INT/C1OUT pin
           0 = Interrupt on falling edge of RA2/AN2/T0CKI/INT/C1OUT pin

bit 5      **T0CS:** TMR0 Clock Source Select bit
           1 = Transition on RA2/AN2/T0CKI/INT/C1OUT pin
           0 = Internal instruction cycle clock (CLKOUT)

bit 4      **T0SE:** TMR0 Source Edge Select bit
           1 = Increment on high-to-low transition on RA2/AN2/T0CKI/INT/C1OUT pin
           0 = Increment on low-to-high transition on RA2/AN2/T0CKI/INT/C1OUT pin

bit 3      **PSA:** Prescaler Assignment bit
           1 = Prescaler is assigned to the WDT
           0 = Prescaler is assigned to the Timer0 module

bit 2-0    **PS<2:0>:** Prescaler Rate Select bits

| Bit Value | TMR0 Rate | WDT Rate[1] |
|---|---|---|
| 000 | 1 : 2 | 1 : 1 |
| 001 | 1 : 4 | 1 : 2 |
| 010 | 1 : 8 | 1 : 4 |
| 011 | 1 : 16 | 1 : 8 |
| 100 | 1 : 32 | 1 : 16 |
| 101 | 1 : 64 | 1 : 32 |
| 110 | 1 : 128 | 1 : 64 |
| 111 | 1 : 256 | 1 : 128 |

**Note 1:**    A dedicated 16-bit WDT postscaler is available for the PIC16F785. See **Section 15.6 "Watchdog Timer (WDT)"** for more information.

| Legend: | | |
|---|---|---|
| R = Readable bit | W = Writable bit | U = Unimplemented bit, read as '0' |
| - n = Value at POR | '1' = Bit is set | '0' = Bit is cleared     x = Bit is unknown |

### 2.2.2.3 INTCON Register

The INTCON register is a readable and writable register, which contains the various enable and flag bits for TMR0 register overflow, PORTA change and external RA2/INT pin interrupts.

> **Note:** Interrupt flag bits are set when an interrupt condition occurs, regardless of the state of its corresponding enable bit or the global enable bit, GIE (INTCON<7>). User software should ensure the appropriate interrupt flag bits are clear prior to enabling an interrupt.

**REGISTER 2-3: INTCON — INTERRUPT CONTROL REGISTER (ADDRESS: 0Bh OR 8Bh)**

| R/W-0 | R/W-0 | R/W-0 | R/W-0 | R/W-0 | R/W-0 | R/W-0 | R/W-0 |
|-------|-------|-------|-------|-------|-------|-------|-------|
| GIE | PEIE | T0IE | INTE | RAIE | T0IF | INTF | RAIF |

bit 7                                                                                                                            bit 0

bit 7 **GIE:** Global Interrupt Enable bit
1 = Enables all unmasked interrupts
0 = Disables all interrupts

bit 6 **PEIE:** Peripheral Interrupt Enable bit
1 = Enables all unmasked peripheral interrupts
0 = Disables all peripheral interrupts

bit 5 **T0IE:** TMR0 Overflow Interrupt Enable bit
1 = Enables the TMR0 interrupt
0 = Disables the TMR0 interrupt

bit 4 **INTE:** RA2/AN2/T0CKI/INT/C1OUT External Interrupt Enable bit
1 = Enables the RA2/AN2/T0CKI/INT/C1OUT external interrupt
0 = Disables the RA2/AN2/T0CKI/INT/C1OUT external interrupt

bit 3 **RAIE:** PORTA Change Interrupt Enable bit[1]
1 = Enables the PORTA change interrupt
0 = Disables the PORTA change interrupt

bit 2 **T0IF:** TMR0 Overflow Interrupt Flag bit[2]
1 = TMR0 register has overflowed (must be cleared in software)
0 = TMR0 register did not overflow

bit 1 **INTF:** RA2/AN2/T0CKI/INT/C1OUT External Interrupt Flag bit
1 = The RA2/AN2/T0CKI/INT/C1OUT external interrupt occurred (must be cleared in software)
0 = The RA2/AN2/T0CKI/INT/C1OUT external interrupt did not occur

bit 0 **RAIF:** PORTA Change Interrupt Flag bit
1 = When at least one of the PORTA <5:0> pins changed state (must be cleared in software)
0 = None of the PORTA <5:0> pins have changed state

**Note 1:** IOCA register must also be enabled.

**2:** T0IF bit is set when Timer0 rolls over. Timer0 is unchanged on Reset and should be initialized before clearing T0IF bit.

| Legend: | | |
|---------|---|---|
| R = Readable bit | W = Writable bit | U = Unimplemented bit, read as '0' |
| - n = Value at POR | '1' = Bit is set | '0' = Bit is cleared    x = Bit is unknown |

# PIC16F785

## 2.2.2.4 PIE1 Register

The PIE1 register contains the interrupt enable bits, as shown in Register 2-4.

| Note: | Bit PEIE (INTCON<6>) must be set to enable any peripheral interrupt. |
|---|---|

**REGISTER 2-4: PIE1 — PERIPHERAL INTERRUPT ENABLE REGISTER 1 (ADDRESS: 8Ch)**

| R/W-0 | R/W-0 | R/W-0 | R/W-0 | R/W-0 | R/W-0 | R/W-0 | R/W-0 |

## 2.2.2.6 PCON Register

The Power Control (PCON) register (See Table 15-2) contains flag bits to differentiate between a:

- Power-on Reset ($\overline{POR}$)
- Brown-out Reset ($\overline{BOR}$)
- Watchdog Timer Reset (WDT)
- External $\overline{MCLR}$ Reset

The PCON register bits are shown in Register 2-6.

**REGISTER 2-6:** **PCON — POWER CONTROL REGISTER (ADDRESS: 8Eh)**

| U-0 | U-0 | U-0 | R/W-1 | U-0 | U-0 | R/W-0 | R/W-x |
|-----|-----|-----|-------|-----|-----|-------|-------|
| — | — | — | SBOREN | — | — | $\overline{POR}$ | $\overline{BOR}$ |
| bit 7 | | | | | | | bit 0 |

bit 7-5 **Unimplemented:** Read as '0'

bit 4 **SBOREN:** Software BOR Enable bit[1]

1 = BOR enabled
0 = BOR disabled

bit 3-2 **Unimplemented:** Read as '0'

bit 1 **$\overline{POR}$:** Power-on Reset Status bit

1 = No Power-on Reset occurred
0 = A Power-on Reset occurred (must be set in software after a Power-on Reset occurs)

bit 0 **$\overline{BOR}$:** Brown-out Reset Status bit

1 = No Brown-out Reset occurred
0 = A Brown-out Resetoccurred (must be set in software after a Brown-out Reset occurs)

**Note 1:** BOREN<1:0> = 01 in Configuration Word for this bit to control the $\overline{BOR}$.

| Legend: | | |
|---------|--------|----------------------------------|
| R = Readable bit | W = Writable bit | U = Unimplemented bit, read as '0' |
| - n = Value at POR | '1' = Bit is set | '0' = Bit is cleared    x = Bit is unknown |

**Preliminary**

## 2.3    PCL and PCLATH

The Program Counter (PC) specifies the address of the instruction to fetch for execution. The program counter is 13 bits wide. The low byte is called the PCL register. The PCL register readable and writable. The high byte of the PC (PC<12:8>) is called the PCH register. This register contains PC<12:8> bits which are not directly readable or writable. All updates to the PCH register go through the PCLATH register.

On any Reset, the PC is cleared. Figure 2-3 shows the two situations for the loading of the PC. The upper example in Figure 2-3 shows how the PC is loaded on a write to PCL (PCLATH<4:0> → PCH). The lower example in Figure 2-3 shows how the PC is loaded during a CALL or GOTO instruction (PCLATH<4:3> → PCH).

### 2.3.1    MODIFYING PCL

Executing any instruction with the PCL register as the destination simultaneously causes the Program Counter PC<12:8> bits (PCH) to be replaced by the contents of the PCLATH register. This allows the entire contents of the program counter to be changed by first writing the desired upper 5 bits to the PCLATH register. When the lower 8 bits are then written to the PCL register, all 13 bits of the program counter will change to the values contained in the PCLATH register and those being written to the PCL register.

A computed GOTO is accomplished by adding an offset to the program counter (ADDWF PCL). Care should be exercised when jumping into a look-up table or program branch table (computed GOTO) by modifying the PCL register. Assuming that PCLATH is set to the table start address, if the table length is greater than 255 instructions, or if the lower 8 bits of the memory address rolls over from 0xFF to 0x00 in the middle of the table, then PCLATH must be incremented for each address rollover that occurs between the table beginning and the target location within the table.

For more information refer to Application Note DS00556, *"Implementing a Table Read"*.

### 2.3.2    PROGRAM MEMORY PAGING

The CALL and GOTO instructions provide 11 bits of address to allow branching within any 2K program memory page. When doing a CALL or GOTO instruction, the upper bit of the address is provided by PCLATH<3> (page select bit). When doing a CALL or GOTO instruction the user must ensure that the page select bit is programmed so that the desired destination program memory page is addressed. When the CALL instruction (or interrupt) is executed, the entire 13-bit PC return address is *push*ed onto the stack. Therefore, manipulation of the PCLATH<3> bit is not required for the RETURN or RETFIE instructions which *pop* the address from the stack.

**FIGURE 2-3:**    **LOADING OF PC IN DIFFERENT SITUATIONS**

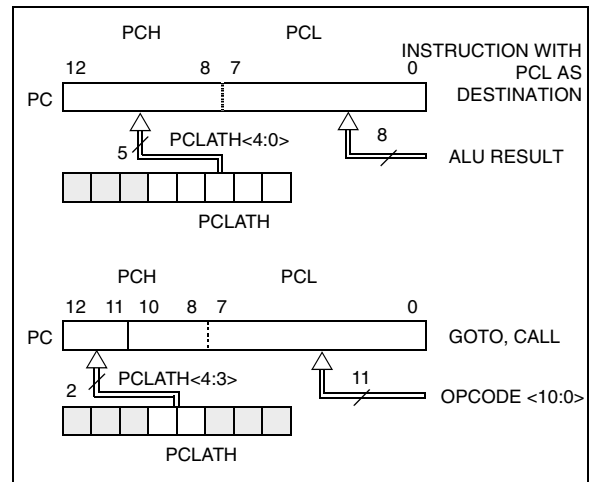

### 2.3.3    STACK

The PIC16F785 family has an 8-level x 13-bit wide hardware stack (see Figure 2-1). The stack space is not part of either program or data space and the stack pointer is not readable or writable. The PC is PUSHed onto the stack when a CALL instruction is executed or an interrupt causes a branch. The stack is POPed in the event of a RETURN, RETLW or a RETFIE instruction execution. PCLATH is not affected by a PUSH or POP operation.

The stack operates as a circular buffer. This means that after the stack has been PUSHed eight times, the ninth PUSH overwrites the value that was stored from the first PUSH. The tenth PUSH overwrites the second PUSH (and so on).

| **Note 1:** | There are no Status bits to indicate stack overflow or stack underflow conditions. |
|---|---|
| **2:** | There are no instructions/mnemonics called *push* or *pop*. These are actions that occur from the execution of the CALL, RETURN, RETLW and RETFIE instructions or the vectoring to an interrupt address. |

# PIC16F785

## 2.4 Indirect Addressing, INDF and FSR Registers

The INDF register is not a physical register. Addressing the INDF register will cause indirect addressing.

Indirect addressing is possible by using the INDF register. Any instruction using the INDF register actually accesses data pointed to by the File Select Register (FSR). Reading INDF itself indirectly will produce 00h. Writing to the INDF register indirectly results in a no operation (although Status bits may be affected). An effective 9-bit address is obtained by concatenating the 8-bit FSR and the IRP bit (Status<7>), as shown in Figure 2-4.

A simple program to clear RAM location 20h – 2Fh using indirect addressing is shown in Example 2-1.

### EXAMPLE 2-1: INDIRECT ADDRESSING

```
          MOVLW  0x20   ;initialize pointer
          MOVWF  FSR    ;to RAM
NEXT      CLRF   INDF   ;clear INDF register
          INCF   FSR    ;increment pointer
          BTFSS  FSR,4  ;all done?
          GOTO   NEXT   ;no clear next
CONTINUE                ;yes continue
```

### FIGURE 2-4: DIRECT/INDIRECT ADDRESSING PIC16F785

For memory map detail see Figure 2-2.
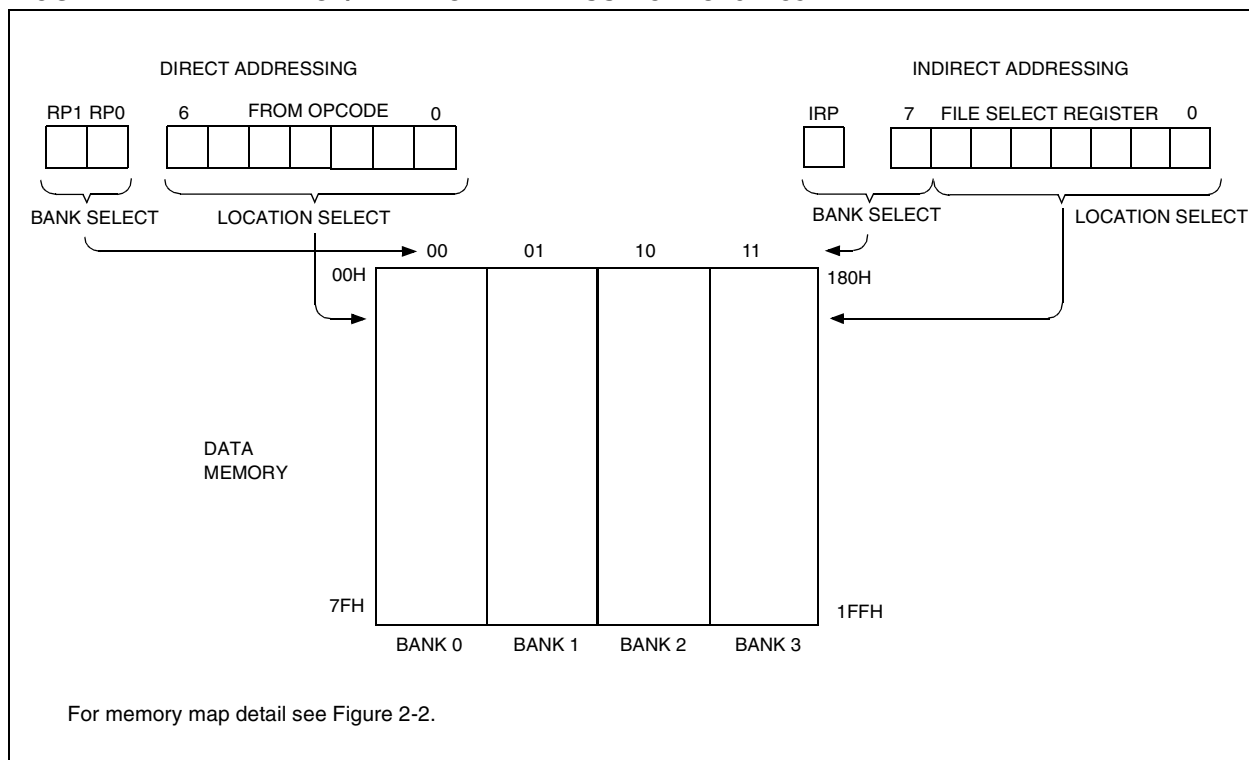

## 3.0 CLOCK SOURCES

### 3.1 Overview

The PIC16F785 has a wide variety of clock sources and selection features to allow it to be used in a wide range of applications while maximizing performance and minimizing power consumption. Figure 3-1 illustrates a block diagram of the PIC16F785 clock sources.

Clock sources can be configured from external oscillators, quartz crystal resonators, ceramic resonators and resistor-capacitor (RC) circuits. In addition, the system clock source can be configured from one of two internal oscillators, with a choice of speeds selectable via software. Additional clock features include:

- Selectable system clock source between external or internal via software.
- Two-speed Clock Start-up mode, which minimizes latency between external oscillator start-up and code execution.
- Fail-Safe Clock Monitor (FSCM) designed to detect a failure of the external clock source (LP, XT, HS, EC or RC modes) and switch to the internal oscillator.

The PIC16F785 can be configured in one of eight clock modes.

1. EC - External clock with I/O on RA4.
2. LP - 32.768 kHz watch crystal or ceramic resonator oscillator mode.
3. XT - Medium gain crystal or ceramic resonator oscillator mode.
4. HS - High gain crystal or ceramic resonator mode.
5. RC - External Resistor-Capacitor (RC) with FOSC/4 output on RA4
6. RCIO - External Resistor-Capacitor with I/O on RA4.
7. INTOSC - Internal Oscillator with FOSC/4 output on RA4 and I/O on RA5.
8. INTOSCIO - Internal Oscillator with I/O on RA4 and RA5.

Clock source modes are configured by the FOSC<2:0> bits in the Configuration Word (See **Section 15.0 "Special Features of the CPU"**). Once the PIC16F785 is programmed and the clock source mode configured, it cannot be changed in software.

**FIGURE 3-1:** PIC16F785 CLOCK SOURCE BLOCK DIAGRAM
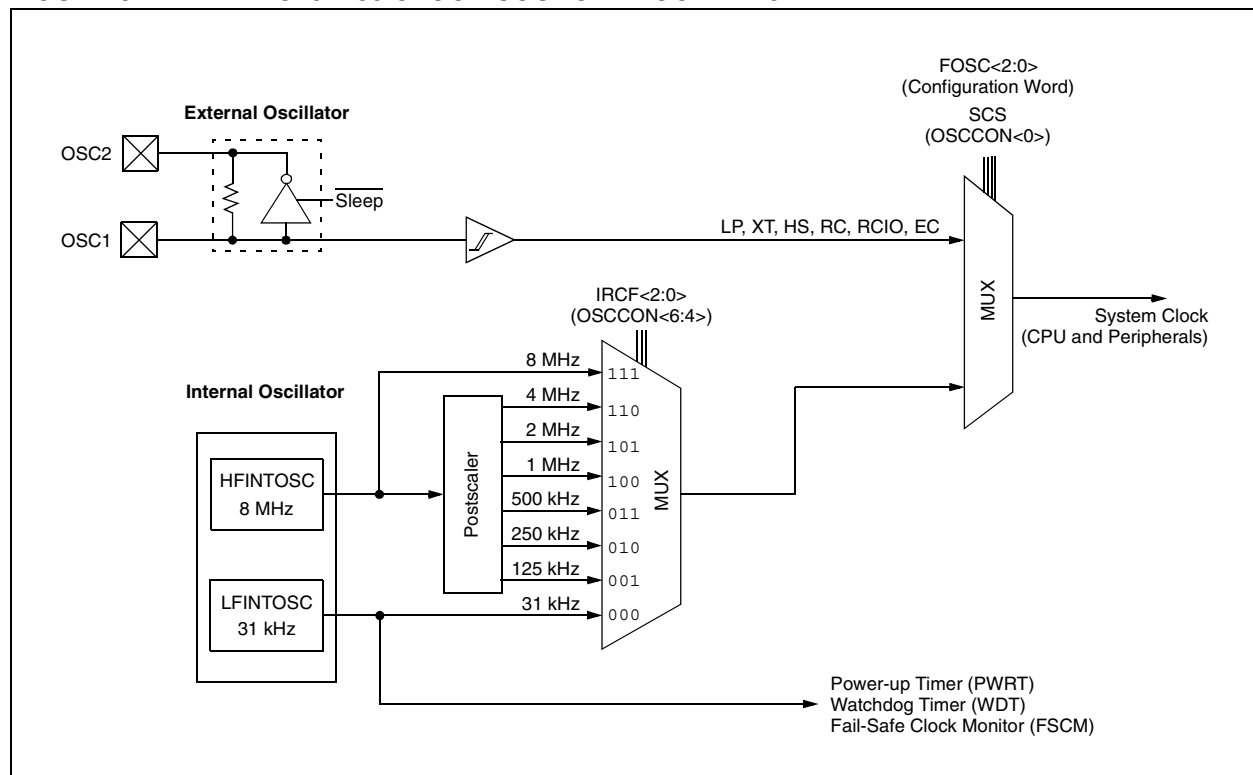

# PIC16F785

## 3.2 Clock Source Modes

Clock source modes can be classified as external or internal.

- External clock modes rely on external circuitry for the clock source. Examples are oscillator modules (EC mode), quartz crystal resonators or ceramic resonators (LP, XT, and HS modes), and resistor-capacitor (RC mode) circuits.
- Internal clock sources are contained internally within the PIC16F785. The PIC16F785 has two internal oscillators; the 8 MHz High-frequency Internal Oscillator (HFINTOSC) and 31 kHz Low-frequency Internal Oscillator (LFINTOSC).

The system clock can be selected between external or internal clock sources via the System Clock Selection (SCS) bit (see **Section 3.5 "Clock Switching"**).

## 3.3 External Clock Modes

### 3.3.1 OSCILLATOR START-UP TIMER (OST)

When the PIC16F785 is configured for any of the crystal oscillator modes (LP, XT or HS), the Oscillator Start-up Timer (OST) is enabled, which extends the reset period to allow the oscillator additional time to stabilize. The OST counts 1024 clock periods present on the OSC1 pin following a Power-on Reset (POR), a wake from Sleep, or when the Power-up Timer (PWRT) has expired (if the PWRT is enabled). During this time, the program counter does not increment and program execution is suspended. The OST ensures that the oscillator circuit, using a quartz crystal resonator or ceramic resonator, has started and is providing a stable system clock to the PIC16F785. Table 3-1 shows examples where the oscillator delay is invoked.

In order to minimize latency between external oscillator start-up and code execution, the Two-speed Clock Start-up mode can be selected (see **Section 3.6 "Two-Speed Clock Start-up Mode"**).

### TABLE 3-1: OSCILLATOR DELAY EXAMPLES

| Switch From | Switch To | Frequency | Oscillator Delay | Comments |
|---|---|---|---|---|
| Sleep/POR | INTRC INTOSC | 31 kHz 125 kHz–8 MHz | 5 µs–10 µs (approx.) CPU Start-up[1] | Following a wake-up from Sleep mode or POR, CPU start-up is invoked to allow the CPU to become ready for code execution. |
| Sleep | EC, RC | DC – 20 MHz | | |
| LFINTOSC (31 kHz) | EC, RC | DC – 20 MHz | | |
| Sleep/POR | LP, XT, HS | 31 kHz–20 MHz | 1024 Clock Cycles (OST) | |
| LFINTOSC (31 kHz) | INTOSC | 125 kHz–8 MHz | 1 µs (approx.) | |

**Note 1:** The 5 µs–10 µs start-up delay is based on a 1 MHz System Clock.

### 3.3.2 EC MODE

The External Clock (EC) mode allows an externally generated logic level as the system clock source. When operating in this mode, an external clock source is connected to OSC1 pin and the RA4 pin is available for general purpose I/O. Figure 3-2 shows the pin connections for EC mode.

The Oscillator Start-up Timer (OST) is disabled when EC mode is selected. Therefore, there is no delay in operation after a Power-on Reset (POR) or wake-up from Sleep. Because the PIC16F785 design is fully static, stopping the external clock input will have the effect of halting the device while leaving all data intact. Upon restarting the external clock, the device will resume operation as if no time had elapsed.

### FIGURE 3-2: EXTERNAL CLOCK (EC) MODE OPERATION
### 3.3.3 LP, XT, HS MODES

The LP, XT and HS modes support the use of quartz crystal resonators or ceramic resonators connected to the OSC1 and OSC2 pins (Figure 3-1). The mode selects a low, medium, or high gain setting of the internal inverter-amplifier to support various resonator types and speed.

**LP** oscillator mode selects the lowest gain setting of the internal inverter-amplifier. LP mode current consumption is the least of the three modes. This mode is best suited to drive resonators with a low drive level specification, for example, tuning fork type crystals.

**XT** oscillator mode selects the intermediate gain setting of the internal inverter-amplifier. XT mode current consumption is the medium of the three modes. This mode is best suited to drive resonators with a medium drive level specification, for example, AT-cut quartz crystal resonators.

**HS** oscillator mode selects the highest gain setting of the internal inverter-amplifier. HS mode current consumption is the highest of the three modes. This mode is best suited for resonators that require a high drive setting, for example, AT-cut quartz crystal resonators or ceramic resonators.

Figure 3-3 and Figure 3-4 show typical circuits for quartz crystal and ceramic resonators, respectively.

**FIGURE 3-3: QUARTZ CRYSTAL OPERATION (LP, XT OR HS MODE)**

Note 1: A series resistor ($R_S$) may be required for quartz crystals with low drive level.

2: The value of $R_F$ varies with the Oscillator mode selected (typically between 2 MΩ to 10 MΩ).
Note 1: Quartz crystal characteristics vary according to type, package and manufacturer. The user should consult the manufacturer data sheets for specifications and recommended application.

2: Always verify oscillator performance over the $V_{DD}$ and temperature range that is expected for the application.

**FIGURE 3-4: CERAMIC RESONATOR OPERATION (XT OR HS MODE)**

Note 1: A series resistor ($R_S$) may be required for ceramic resonators with low drive level.

2: The value of $R_F$ varies with the oscillator mode selected (typically between 2 MΩ to 10 MΩ).

3: An additional parallel feedback resistor ($R_P$) may be required for proper ceramic resonator operation (typical value 1 MΩ).

# PIC16F785

## 3.3.4 EXTERNAL RC MODES

The External Resistor-Capacitor (RC) modes support the use of an external RC circuit. This allows the designer maximum flexibility in frequency choice while keeping costs to a minimum when clock accuracy is not required. There are two modes, RC and RCIO.
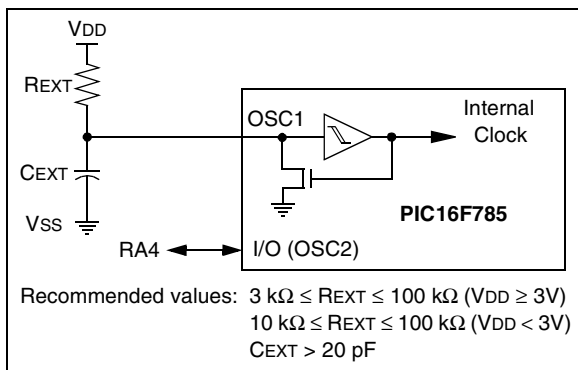

In RC mode, the RC circuit connects to the OSC1 pin. The OSC2/CLKOUT pin outputs the RC oscillator frequency divided by 4. This signal may be used to provide a clock for external circuitry, synchronization, calibration, test or other application requirements. Figure 3-5 shows the RC mode connections.

**FIGURE 3-5:** **RC MODE**

Recommended values: $3 \text{ k}\Omega \le R_{EXT} \le 100 \text{ k}\Omega$ (VDD ≥ 3V)
$10 \text{ k}\Omega \le R_{EXT} \le 100 \text{ k}\Omega$ (VDD < 3V)
$C_{EXT} > 20 \text{ pF}$
In RCIO mode, the RC circuit is connected to the OSC1 pin. The OSC2 pin becomes an additional general purpose I/O pin. The I/O pin becomes bit 4 of PORTA (RA4). Figure 3-6 shows the RCIO mode connections.

**FIGURE 3-6:** **RCIO MODE**

Recommended values: $3 \text{ k}\Omega \le R_{EXT} \le 100 \text{ k}\Omega$ (VDD ≥ 3V)
$10 \text{ k}\Omega \le R_{EXT} \le 100 \text{ k}\Omega$ (VDD < 3V)
$C_{EXT} > 20 \text{ pF}$

The RC oscillator frequency is a function of the supply voltage, the resistor ($R_{EXT}$) and capacitor ($C_{EXT}$) values and the operating temperature. In addition to this, the oscillator frequency will vary from unit-to-unit due to normal threshold voltage. Furthermore, the difference in lead frame capacitance between package types will also affect the oscillation frequency or low $C_{EXT}$ values. The user also needs to take into account variation due to tolerance of external RC components used.

## 3.4 Internal Clock Modes

The PIC16F785 has two independent, internal oscillators that can be configured or selected as the system clock source.

1. The **HFINTOSC** (High-frequency Internal Oscillator) is factory calibrated and operates at 8 MHz. The frequency of the HFINTOSC can be user adjusted ±12% via software using the OSCTUNE register (Register 3-1).
2. The **LFINTOSC** (Low-frequency Internal Oscillator) is uncalibrated and operates at approximately 31 kHz.

The system clock speed can be selected via software using the Internal Oscillator Frequency Select (IRCF) bits.

The system clock can be selected between external or internal clock sources via the System Clock Selection (SCS) bit (See **Section 3.5 "Clock Switching"**).

### 3.4.1 INTRC AND INTRCIO MODES

The INTRC and INTRCIO modes configure the internal oscillators as the system clock source when the device is programmed using the Oscillator Selection (FOSC) bits in the Configuration Word (Register 12-1).

In **INTRC** mode, the OSC1 pin is available for general purpose I/O. The OSC2/CLKOUT pin outputs the selected internal oscillator frequency divided by 4. The CLKOUT signal may be used to provide a clock for external circuitry, synchronization, calibration, test or other application requirements.

In **INTRCIO** mode, the OSC1 and OSC2 pins are available for general purpose I/O.

### 3.4.2 HFINTOSC

The High-frequency Internal Oscillator (HFINTOSC) is a factory calibrated 8 MHz internal clock source. The frequency of the HFINTOSC can be altered approximately ±12% via software using the OSCTUNE register (Register 3-1).

The output of the HFINTOSC connects to a postscaler and multiplexer (see Figure 3-1). One of seven frequencies can be selected via software using the IRCF bits (see **Section 3.4.4 "Frequency Select Bits (IRCF)"**).

The HFINTOSC is enabled by selecting any frequency between 8 MHz and 125 kHz (IRCF ≠ 000) as the system clock source (SCS = 1) or when Two-Speed Start-up is enabled (IESO = 1 and IRCF ≠ 000).

The HF Internal Oscillator (HTS) bit, (OSCCON<2>), indicates whether the HFINTOSC is stable or not.

### 3.4.2.1 Calibration Bits

The 8 MHz High-frequency Internal Oscillator (HFINTOSC) is factory calibrated. The HFINTOSC calibration bits are stored in the Calibration Word (CALIB) located in program memory location 2008h. The calibration word is not erased using the specified bulk erase sequence in the *PIC16F785 Memory Programming Specification* (DS41237) and does not require reprogramming. For more information on the Calibration Word register (See **Section 15.2 "Calibration Bits"**).

| Note: | Address 2008h is beyond the user program memory space. It belongs to the special Configuration Memory space (2000h – 3FFFh), which can be accessed only during programming. See *PIC16F785 Memory Programming Specification* (DS41237) for more information. |
|---|---|

### 3.4.2.2 OSCTUNE Register

The HFINTOSC is factory calibrated but can be adjusted in software by writing to the OSCTUNE register (Register 3-1).

The OSCTUNE register has a tuning range of ±12%. The default value of the OSCTUNE register is '0'. The value is a 5-bit two's complement number. Due to process variation, the monotonicity and frequency step cannot be specified.

When the OSCTUNE register is modified, the HFINTOSC frequency will begin shifting to the new frequency. The HFINTOSC clock will stabilize within 1 ms. Code execution continues during this shift. There is no indication that the shift has occurred.

OSCTUNE does not affect the LFINTOSC frequency. Operation of features that depend on the LFINTOSC clock source frequency, such as the Power-up Timer (PWRT), Watchdog Timer (WDT), Fail-Safe Clock Monitor (FSCM) and peripherals, are *not* affected by the change in frequency.

**REGISTER 3-1: OSCTUNE — OSCILLATOR TUNING RESISTOR (ADDRESS 90h)**

# PIC16F785

### 3.4.3 LFINTOSC

The Low-frequency Internal Oscillator (LFINTOSC) is an uncalibrated (approximate) 31 kHz internal clock source.

The output of the LFINTOSC connects to a postscaler and multiplexer (see Figure 3-1). 31 kHz can be selected via software using the IRCF bits (see **Section 3.4.4 "Frequency Select Bits (IRCF)"**). The LFINTOSC is also the frequency for the Power-up Timer (PWRT), Watchdog Timer (WDT) and Fail-Safe Clock Monitor (FSCM).

The LFINTOSC is enabled by selecting 31 kHz (IRCF = 000) as the system clock source (SCS = 1), or when any of the following are enabled:

- Two-Speed Start-up (IESO = 1 and IRCF = 000)
- Power-up Timer (PWRT)
- Watchdog Timer (WDT)
- Fail-Safe Clock Monitor (FSCM)

The LF Internal Oscillator (LTS) bit, (OSCCON<1>), indicates whether the LFINTOSC is stable or not.

### 3.4.4 FREQUENCY SELECT BITS (IRCF)

The output of the 8 MHz HFINTOSC and 31 kHz LFINTOSC connect to a postscaler and multiplexer (see Figure 3-1). The Internal Oscillator Frequency select bits IRCF<2:0> (OSCCON<6:4>) select the frequency output of the internal oscillators. One of eight frequencies can be selected via software:

- 8 MHz
- 4 MHz (Default after Reset)
- 2 MHz
- 1 MHz
- 500 kHz
- 250 kHz
- 125 kHz
- 31 kHz

> **Note:** Following any Reset, the IRCF bits are set to '110' and the frequency selection is forced to 4 MHz. The user can modify the IRCF bits to select a different frequency.

### 3.4.5 HF AND LF INTOSC CLOCK SWITCH TIMING

When switching between the LFINTOSC and the HFINTOSC, the new oscillator may already be shut down to save power. If this is the case, there is a 10 µs delay after the IRCF bits are modified before the frequency selection takes place. The LTS/HTS bits will reflect the current active status of the LFINTOSC and the HFINTOSC oscillators. The timing of a frequency selection is as follows:

1. IRCF bits are modified.
2. If the new clock is shut down, a 10 µs clock start-up delay is started.
3. Clock switch circuitry waits for a falling edge of the current clock.
4. CLKOUT is held low and the clock switch circuitry waits for a rising edge in the new clock.
5. CLKOUT is now connected with the new clock. HTS/LTS bits are updated as required.
6. Clock switch is complete.

If the internal oscillator speed selected is between 8 MHz and 125 kHz, there is no start-up delay before the new frequency is selected. This is because the old and the new frequencies are derived from the HFINTOSC via the postscaler and multiplexer.

> **Note:** Care must be taken to ensure an invalid voltage or frequency selection is not selected. An example of an invalid configuration is selecting 8 MHz when $V_{DD}$ is 2.0V.

## 3.5 Clock Switching

The system clock source can be switched between external and internal clock sources via software using the System Clock Select (SCS) bit.

### 3.5.1 SYSTEM CLOCK SELECT (SCS) BIT

The System Clock Select (SCS) bit, (OSCCON<0>), selects the system clock source that is used for the CPU and peripherals.

- When SCS = 0, the system clock source is determined by configuration of the FOSC<2:0> bits in Configuration Word (CONFIG).
- When SCS = 1, the system clock source is chosen by the internal oscillator frequency selected by the IRCF bits. After a Reset, SCS is always cleared.

> **Note:** Any automatic clock switch, which may occur from Two-Speed Start-up or Fail-Safe Clock Monitor, does not update the SCS bit. The user can monitor the OSTS (OSCCON<3>) to determine the current system clock source.

### 3.5.2 OSCILLATOR START-UP TIME-OUT STATUS BIT

The Oscillator Start-up Time-out Status (OSTS) bit, (OSCCON<3>), indicates whether the system clock is running from the external clock source as defined by the FOSC bits, or from internal clock source. In particular, OSTS indicates that the Oscillator Start-up Timer (OST) has timed out for LP, XT or HS modes.

## 3.6 Two-Speed Clock Start-up Mode

Two-Speed Start-up mode provides additional power savings by minimizing the latency between external oscillator start-up and code execution. In applications that make heavy use of the Sleep mode, Two-Speed Start-up will remove the external oscillator start-up time from the time spent awake and can reduce the overall power consumption of the device.

This mode allows the application to wake-up from Sleep, perform a few instructions using the INTOSC as the clock source and go back to Sleep without waiting for the primary oscillator to become stable.

> **Note:** Executing a SLEEP instruction will abort the Oscillator Start-up Time and will cause the OSTS bit (OSCCON<3>) to remain clear.

When the PIC16F785 is configured for LP, XT, or HS modes, the Oscillator Start-up Timer (OST) is enabled (See **Section 3.3.1 "Oscillator Start-up Timer (OST)"**). The OST timer will suspend program execution until 1024 oscillations are counted. Two-Speed Start-up mode minimizes the delay in code execution by operating from the internal oscillator as the OST is counting. When the OST count reaches 1024 and the OSTS bit (OSCCON<3>) is set, program execution switches to the external oscillator.

### 3.6.1 TWO-SPEED START-UP MODE CONFIGURATION

Two-Speed Start-up mode is configured by the following settings:

- IESO = 1 (CONFIG<10>) Internal/External Switch Over bit.
- SCS = 0.
- FOSC configured for LP, XT or HS mode.

Two-Speed Start-up mode is entered after:

- Power-on Reset (POR) and, if enabled, after PWRT has expired, or
- Wake-up from Sleep.

If the external clock oscillator is configured to be anything other than LP, XT or HS mode, then Two-Speed Start-up is disabled. This is because the external clock oscillator does not require any stabilization time after POR or an exit from Sleep.

### 3.6.2 TWO-SPEED START-UP SEQUENCE

1. Wake-up from Power-on Reset or Sleep.
2. Instructions begin execution by the internal oscillator at the frequency set in the IRCF bits (OSCCON<6:4>).
3. OST enabled to count 1024 clock cycles.
4. OST timed out, wait for falling edge of the internal oscillator.
5. OSTS is set.
6. System clock held low until the next falling edge of new clock (LP, XT or HS mode).
7. System clock is switched to external clock source.

### 3.6.3 CHECKING EXTERNAL/INTERNAL CLOCK STATUS

Checking the state of the OSTS bit (OSCCON<3>) will confirm if the PIC16F785 is running from the external clock source as defined by the FOSC bits in the Configuration Word (CONFIG) or the internal oscillator.
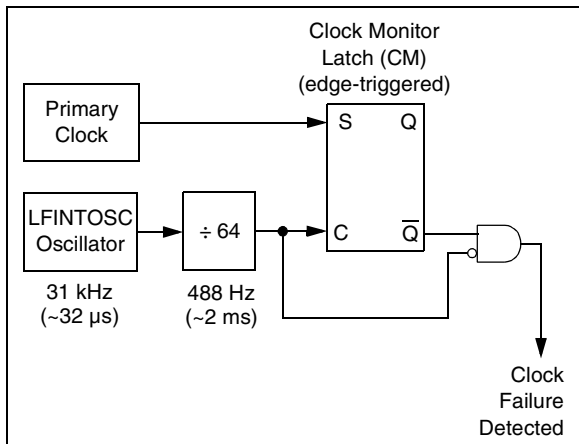

**FIGURE 3-7: TWO-SPEED START-UP**

## 3.7 Fail-Safe Clock Monitor

The Fail-Safe Clock Monitor (FSCM) is designed to allow the device to continue to operate in the event of an oscillator failure. The FSCM can detect oscillator failure at any point after the device has exited a Reset or Sleep condition and the Oscillator Start-up Timer (OST) has expired.

**FIGURE 3-8: FSCM BLOCK DIAGRAM**

The FSCM function is enabled by setting the FCMEN bit in Configuration Word (CONFIG). It is applicable to all external clock options (LP, XT, HS, EC, RC or I/O modes).
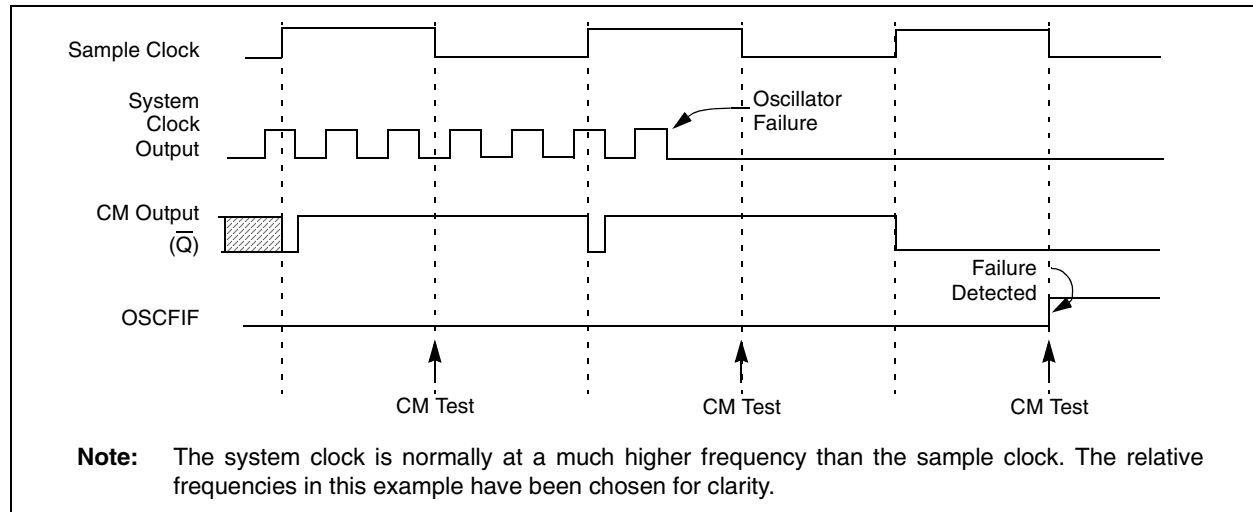

In the event of an external clock failure, the FSCM will set the OSFIF bit (PIR1<2>) and generate an oscillator fail interrupt if the OSFIE bit (PIE1<2>) is set. The device will then switch the system clock to the internal oscillator. The system clock will continue to come from the internal oscillator unless the external clock recovers and the Fail-Safe condition is exited.

The frequency of the internal oscillator will depend upon the value contained in the IRCF bits (OSCCON<6:4>). Upon entering the Fail-Safe condition, the OSTS bit (OSCCON<3>) is automatically cleared to reflect that the internal oscillator is active and the WDT is cleared. The SCS bit (OSCCON<0>) is not updated. Enabling FSCM does not affect the LTS bit.

The FSCM sample clock is generated by dividing the LFINTOSC clock by 64. This will allow enough time between FSCM sample clocks for a system clock edge to occur. Figure 3-8 shows the FSCM block diagram.

On the rising edge of the sample clock, the monitoring latch (CM = 0) will be cleared. On a falling edge of the primary system clock, the monitoring latch will be set (CM = 1). In the event that a falling edge of the sample clock occurs, and the monitoring latch is not set, a clock failure has been detected. The assigned internal oscillator is enabled when FSCM is enabled as reflected by the IRCF bits.

| **Note:** | Two-Speed Start-up is automatically enabled when the Fail-Safe Clock Monitor mode is enabled. |
|---|---|

### 3.7.1 FAIL-SAFE CONDITION CLEARING

The Fail-Safe condition is cleared after a Reset, the execution of a `SLEEP` instruction, or a modification of the SCS bit. While in Fail-Safe condition, the PIC16F785 uses the internal oscillator as the system clock source. The IRCF bits (OSCCON<6:4>) can be modified to adjust the internal oscillator frequency without exiting the Fail-Safe condition.

The Fail-Safe condition must be cleared before the OSFIF flag can be cleared.

**FIGURE 3-9:          FSCM TIMING DIAGRAM**

**Note:** The system clock is normally at a much higher frequency than the sample clock. The relative frequencies in this example have been chosen for clarity.

### 3.7.2 RESET OR WAKE-UP FROM SLEEP

The FSCM is designed to detect oscillator failure at any point after the device has exited a Reset or Sleep condition and the Oscillator Start-up Timer (OST) has expired. If the external clock is EC or RC mode, monitoring will begin immediately following these events.

For LP, XT or HS mode, the external oscillator may require a start-up time considerably longer than the FSCM sample clock time; a false clock failure may be detected (See Figure 3-9). To prevent this, the internal oscillator is automatically configured as the system clock and functions until the external clock is stable (the OST has timed out). This is identical to Two-Speed Start-up mode. Once the external oscillator is stable, the LFINTOSC returns to its role as the FSCM source.

**Note:** Due to the wide range of oscillator start-up times, the Fail-Safe circuit is not active during oscillator start-up (i.e., after exiting Reset or Sleep). After an appropriate amount of time, the user should check the OSTS bit (OSCCON<3>) to verify the oscillator start-up and system clock switchover has successfully completed.

**REGISTER 3-2:** **OSCCON — OSCILLATOR CONTROL REGISTER (ADDRESS: 8Fh)**

## 4.0 I/O PORTS

There are seventeen general purpose I/O pins and one input only pin available. Depending on which peripherals are enabled, some or all of the pins may not be available as general purpose I/O. In general, when a peripheral is enabled, the associated pin may not be used as a general purpose I/O pin.

| Note: | Additional information on I/O ports may be found in the *PICmicro® Mid-Range Reference Manual* (DS33023). |
|---|---|

### 4.1 PORTA and TRISA Registers

PORTA is a 6-bit wide, bidirectional port. The corresponding data direction register is TRISA (Register 4-2). Setting a TRISA bit (= 1) will make the corresponding PORTA pin an input (i.e., put the corresponding output driver in a High-impedance mode). Clearing a TRISA bit (= 0) will make the corresponding PORTA pin an output (i.e., put the contents of the output latch on the selected pin). The exception is RA3, which is input only and its TRIS bit will always read as '1'. Example 4-1 shows how to initialize PORTA.

Reading the PORTA register (Register 4-1) reads the status of the pins, whereas writing to it will write to the port latch. All write operations are read-modify-write operations. Therefore, a write to a port implies that the port pins are read; this value is modified and then written to the port data latch. RA3 reads '0' when MCLRE = 1.

The TRISA register controls the direction of the PORTA pins, even when they are being used as analog inputs. The user must ensure the bits in the TRISA register are maintained set when using them as analog inputs. I/O pins configured as analog inputs always read '0'.

When RA1 is configured as a voltage reference output, the RA1 digital output driver will automatically be disabled while not affecting the TRISA<1> value.

| Note: | The ANSEL0 (91h) register must be initialized to configure an analog channel as a digital input. Pins configured as analog inputs will read '0'. |
|---|---|

| - n = Value at POR | 1 = Bit is set | 0 = Bit is cleared    x = Bit is unknown |

## 4.2    Additional Pin Functions

Every PORTA pin on the PIC16F785 has an interrupt-on-change option and a weak pull-up option. The next three sections describe these functions.

### 4.2.1    WEAK PULL-UPS

Each of the PORTA pins has an individually config-urable internal weak pull-up. Control bits WPUAx enable or disable each pull-up. Refer to Register 4-3. Each weak pull-up is automatically turned off when the port pin is configured as an output. The pull-ups are disabled on a Power-on Reset by the $\overline{RAPU}$ bit (OPTION_REG<7>). The weak pull-up on RA3 is automatically enabled when RA3 is configured as $\overline{MCLR}$.

**REGISTER 4-3:** **WPUA — WEAK PULL-UP REGISTER (ADDRESS: 95h)[1,2]**

| U-0 | U-0 | R/W-1 | R/W-1 | R/W-1 | R/W-1 | R/W-1 | R/W-1 |
|-----|-----|-------|-------|-------|-------|-------|-------|
| — | — | WPUA5[4] | WPUA4[4] | WPUA3[3] | WPUA2 | WPUA1 | WPUA0 |

bit 7                                                                      bit 0

bit 7-6 **Unimplemented:** Read as '0'

bit 5-0 **WPUA<5:0>:** Weak Pull-up Register bits

$1$ = Pull-up enabled

$0$ = Pull-up disabled

**Note 1:** Global $\overline{RAPU}$ must be enabled for individual pull-ups to be enabled.

**2:** The weak pull-up device is automatically disabled if the pin is in Output mode (TRISA = $0$).

**3:** The RA3 pull-up is automatically enabled when configured as $\overline{MCLR}$ in the Configuration Word.

**4:** WPUA<5:4> always reads '1' in XT, HS and LP OSC modes.

| Legend: | | |
|---------|---|---|
| R = Readable bit | W = Writable bit | U = Unimplemented bit, read as '0' |
| - n = Value at POR | '1' = Bit is set | '0' = Bit is cleared    x = Bit is unknown |

### 4.2.2    INTERRUPT-ON-CHANGE

Each of the PORTA pins is individually configurable as an interrupt-on-change pin. Control bits IOCAx enable or disable the interrupt function for each pin. Refer to Register 4-4. The interrupt-on-change is disabled on a Power-on Reset.

For enabled interrupt-on-change pins, the values are compared with the old value latched on the last read of PORTA. The 'mismatch' outputs of the last read are OR'd together to set, the PORTA Change Interrupt flag bit (RAIF) in the INTCON register (Register 2-3).

This interrupt can wake the device from Sleep. The user, in the Interrupt Service Routine, clears the interrupt by:

a)   Any read or write of PORTA. This will end the mismatch condition, then,

b)   Clear the flag bit RAIF.

A mismatch condition will continue to set flag bit RAIF. Reading PORTA will end the mismatch condition and allow flag bit RAIF to be cleared. The latch holding the last read value is neither affected by an $\overline{MCLR}$ nor BOR Reset. After these resets, the RAIF flag will continue to be set if a mismatch is present.

> **Note:**  If a change on the I/O pin should occur when the read operation is being executed (start of the Q2 cycle), then the RAIF interrupt flag may not get set.

**REGISTER 4-4:    IOCA — INTERRUPT-ON-CHANGE PORTA REGISTER (ADDRESS: 96h)[1]**

| U-0 | U-0 | R/W-0 | R/W-0 | R/W-0 | R/W-0 | R/W-0 | R/W-0 |

### 4.2.3 PORTA PIN DESCRIPTIONS AND DIAGRAMS

Each PORTA pin is multiplexed with other functions. The pins and their combined functions are briefly described here. For specific information about individual functions such as the comparator or the A/D, refer to the appropriate section in this Data Sheet.
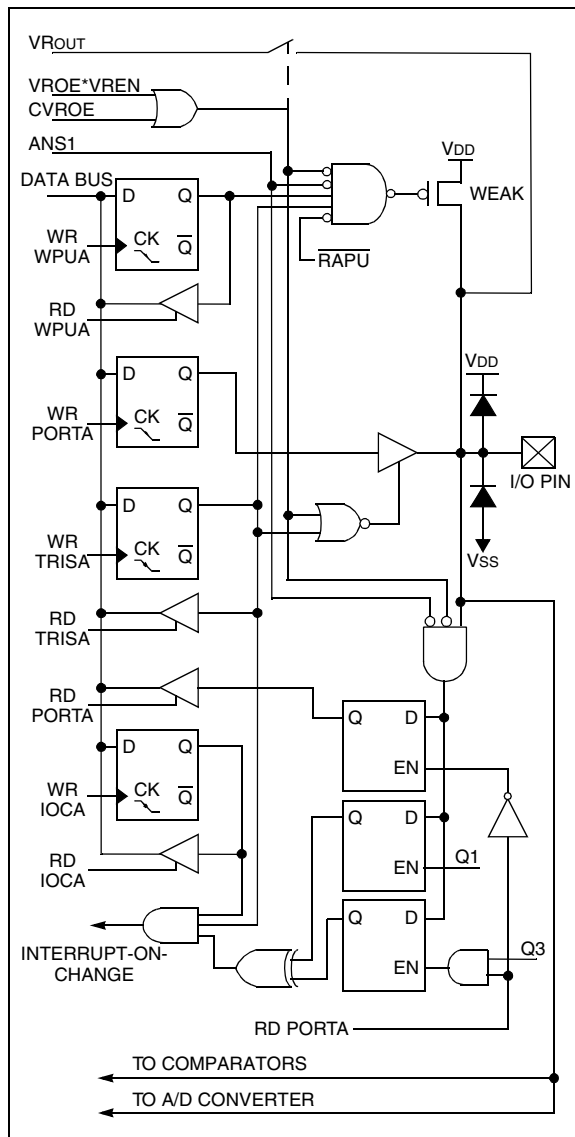

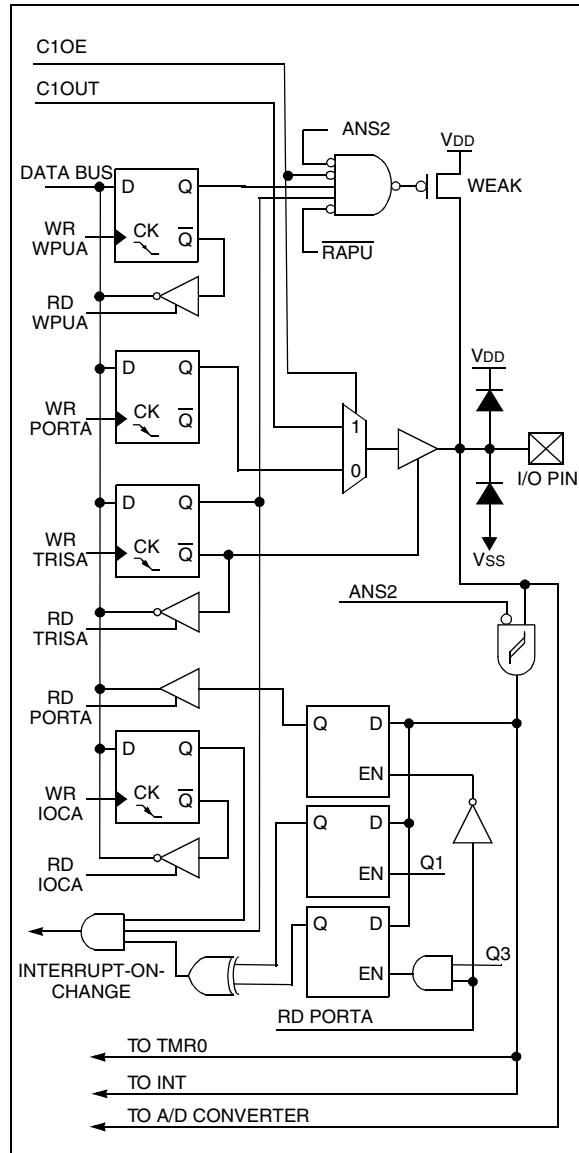

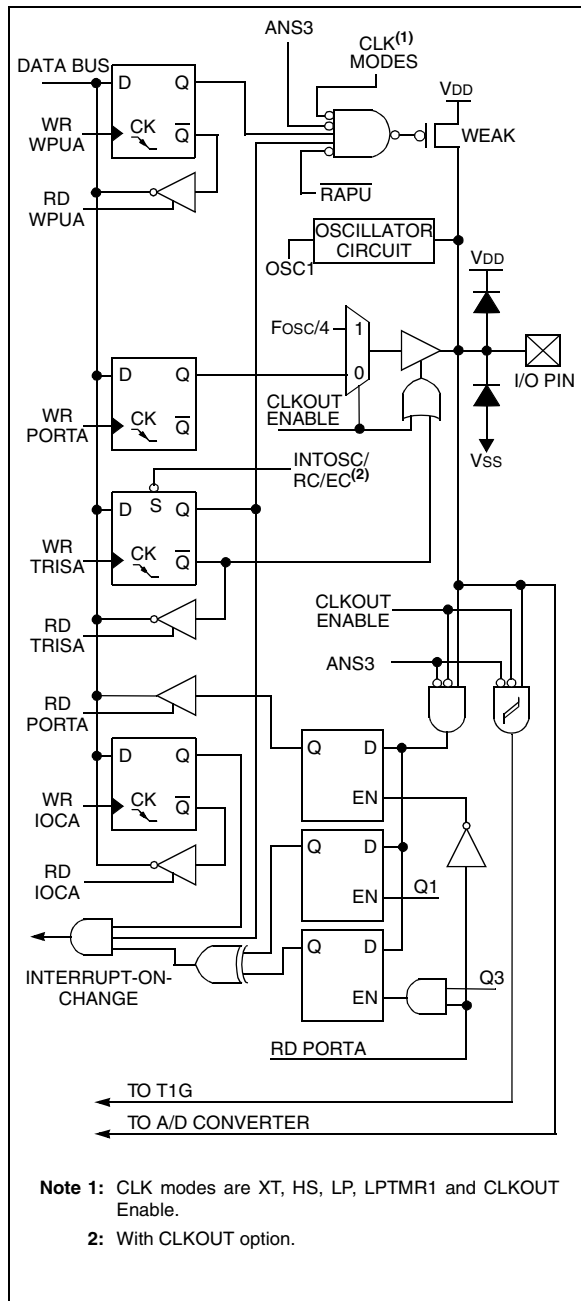

#### 4.2.3.1 RA0/AN0/C1IN+/ICSPDAT

Figure 4-1 shows the diagram for this pin. The RA0 pin is configurable to function as one of the following:

- a general purpose I/O
- an analog input for the A/D
- an analog input to comparator 1
- In-Circuit Serial Programming™ data

**FIGURE 4-1:** **BLOCK DIAGRAM OF RA0**

#### 4.2.3.2 RA1/AN1/C12IN0-/VREF/ICSPCLK

Figure 4-1 shows the diagram for this pin. The RA1 pin is configurable to function as one of the following:

- a general purpose I/O
- an analog input for the A/D
- an analog input to comparators 1 & 2
- a voltage reference input for the A/D
- a buffered or unbuffered voltage reference output
- In-Circuit Serial Programming clock

**FIGURE 4-2:** **BLOCK DIAGRAM OF RA1**

**Preliminary**

## 4.2.3.3 RA2/AN2/T0CKI/INT/C1OUT

Figure 4-3 shows the diagram for this pin. The RA2 pin is configurable to function as one of the following:

• a general purpose I/O
• an analog input for the A/D
• the clock input for TMR0
• an external edge triggered interrupt
• a digital output from comparator 1

**FIGURE 4-3: BLOCK DIAGRAM OF RA2**

## 4.2.3.4 RA3/$\overline{\text{MCLR}}$/VPP

Figure 4-4 shows the diagram for this pin. The RA3 pin is configurable to function as one of the following:

• a general purpose input
• as Master Clear Reset w/weak pull-up

**FIGURE 4-4: BLOCK DIAGRAM OF RA3**
# PIC16F785

### 4.2.3.5 RA4/AN3/T1G/OSC2/CLKOUT

Figure 4-5 shows the diagram for this pin. The RA4 pin is configurable to function as one of the following:

- a general purpose I/O
- an analog input for the A/D
- a TMR1 gate input
- a crystal/resonator connection
- a clock output

**FIGURE 4-5:** **BLOCK DIAGRAM OF RA4**

**Note 1:** CLK modes are XT, HS, LP, LPTMR1 and CLKOUT Enable.

**2:** With CLKOUT option.

### 4.2.3.6 RA5/T1CKI/OSC1/CLKIN

Figure 4-6 shows the diagram for this pin. The RA5 pin is configurable to function as one of the following:

- a general purpose I/O
- a TMR1 clock input
- a crystal/resonator connection
- a clock input

**FIGURE 4-6:** **BLOCK DIAGRAM OF RA5**

**Note 1:** CLK modes are XT, HS, LP and LPTMR1.

**2:** When using Timer1 with LP oscillator, the Schmitt Trigger is bypassed.
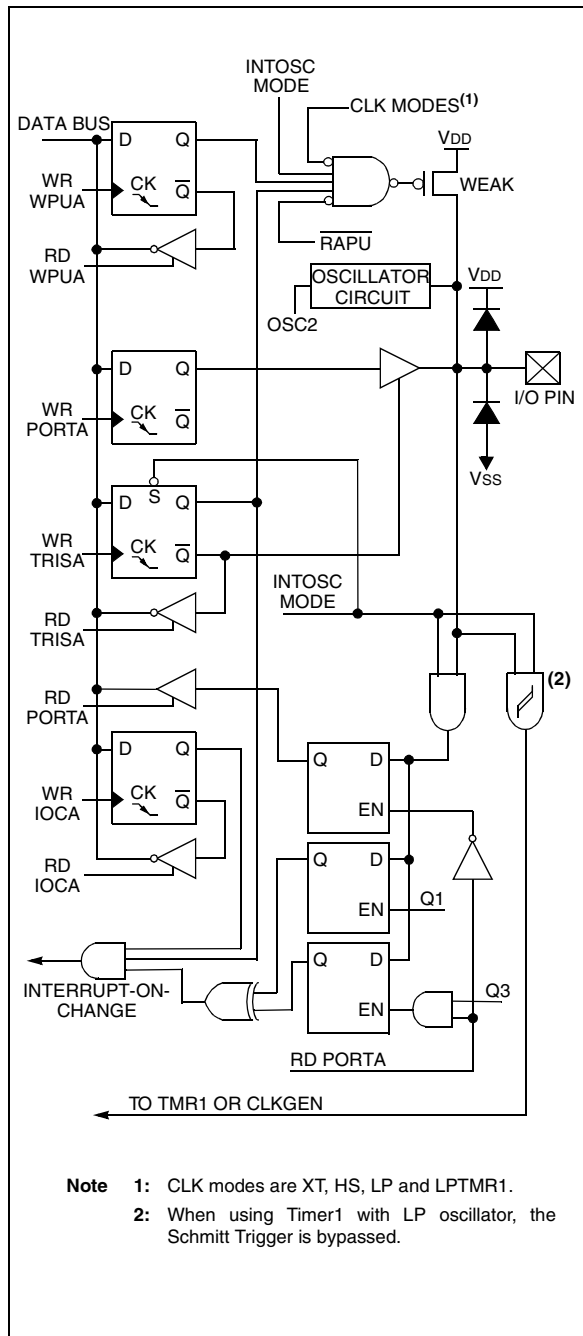

**TABLE 4-1: SUMMARY OF REGISTERS ASSOCIATED WITH PORTA**

## 4.3 PORTB and TRISB Registers

PORTB is a 4-bit wide, bidirectional port. The corresponding data direction register is TRISB (Register 4-6). Setting a TRISB bit (= 1) will make the corresponding PORTB pin an input (i.e., put the corresponding output driver in a High-impedance mode). Clearing a TRISB bit (= 0) will make the corresponding PORTB pin an output (i.e., put the contents of the output latch on the selected pin). Example 4-2 shows how to initialize PORTB.

Reading the PORTB register (Register 4-5) reads the status of the pins, whereas writing to it will write to the port latch. All write operations are read-modify-write operations. Therefore, a write to a port implies that the port pins are read, this value is modified and then written to the port data latch.

Pin RB6 is an open drain output. All other PORTB pins have full CMOS output drivers.

The TRISB register controls the direction of the PORTB pins, even when they are being used as analog inputs. The user must ensure the bits in the TRISB register are maintained set when using them as analog inputs. I/O pins configured as analog input always read '0'.

> **Note:** The ANSEL1 (93h) register must be initialized to configure an analog channel as a digital input. Pins configured as analog inputs will read '0'.

### EXAMPLE 4-2: INITIALIZING PORTB

### 4.3.1 PORTB PIN DESCRIPTIONS AND DIAGRAMS

Each PORTB pin is multiplexed with other functions. The pins and their combined functions are briefly described here. For specific information about individual functions such as the PWM, operational amplifier, or the A/D, refer to the appropriate section in this Data Sheet.

#### 4.3.1.1 RB4/AN10/OP2-

The RB4/AN10/OP2- pin is configurable to function as one of the following:

• a general purpose I/O
• an analog input to the A/D
• an analog input to Op Amp 2

#### 4.3.1.2 RB5/AN11/OP2+

The RB5/AN11/OP2+ pin is configurable to function as one of the following:

• a general purpose I/O
• an analog input to the A/D
• an analog input to Op Amp 2

**FIGURE 4-7:** **BLOCK DIAGRAM OF RB4 AND RB5**

#### 4.3.1.3 RB6

The RB6 pin is configurable to function as the following:

• an open drain general purpose I/O

**FIGURE 4-8:** **BLOCK DIAGRAM OF RB6**

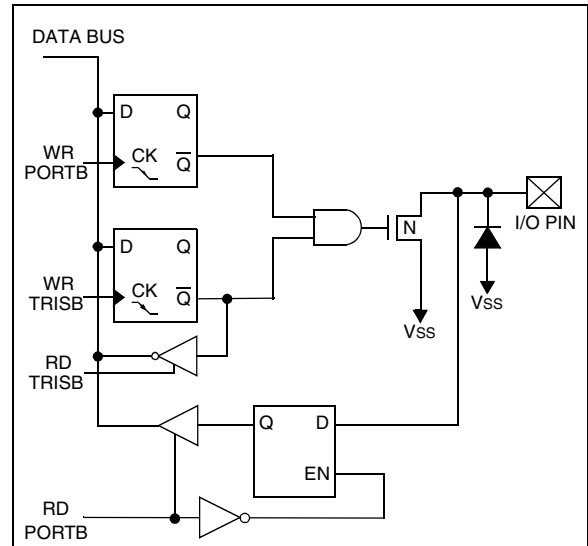

#### 4.3.1.4 RB7/SYNC

The RB7/SYNC pin is configurable to function as one of the following:

• a general purpose I/O
• PWM synchronization input and output

**FIGURE 4-9:** **BLOCK DIAGRAM OF RB7**
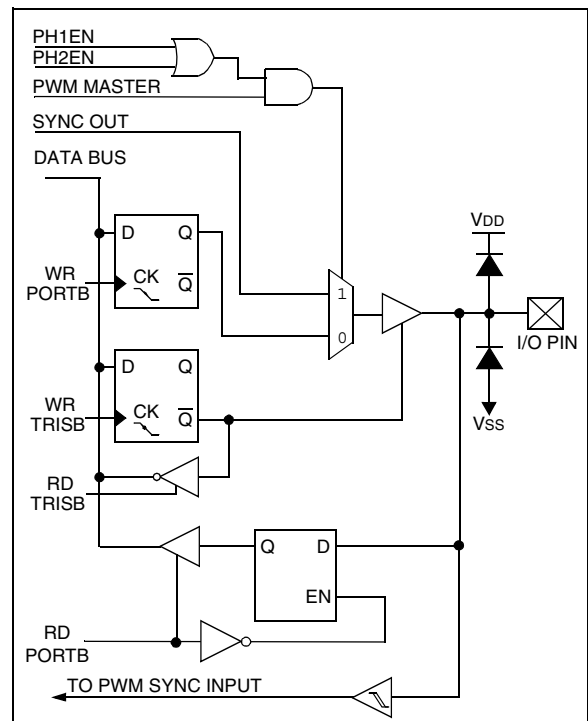

# PIC16F785

## 4.4 PORTC and TRISC Registers

PORTC is an 8-bit wide, bidirectional port. The corresponding data direction register is TRISC (Register 4-8). Setting a TRISC bit (= 1) will make the corresponding PORTC pin an input (i.e., put the corresponding output driver in a High-impedance mode). Clearing a TRISC bit (= 0) will make the corresponding PORTC pin an output (i.e., put the contents of the output latch on the selected pin). Example 4-3 shows how to initialize PORTC.

Reading the PORTC register (Register 4-7) reads the status of the pins, whereas writing to it will write to the port latch. All write operations are read-modify-write operations. Therefore, a write to a port implies that the port pins are read, this value is modified and then written to the port data latch.

The TRISC register controls the direction of the PORTC pins, even when they are being used as analog inputs. The user must ensure the bits in the TRISC register are maintained set when using them as analog inputs. I/O pins configured as analog input always read '0'.

When RC4 or RC5 is configured as an op amp output, the corresponding RC4 or RC5 digital output driver will automatically be disabled regardless of the TRISC<4> or TRISC<5> value.

> **Note:** The ANSEL0 (91h) and ANSEL1 (93h) registers must be initialized to configure an analog channel as a digital input. Pins configured as analog inputs will read '0'.

## 4.4.1 PORTC PIN DESCRIPTIONS AND DIAGRAMS

Each PORTC pin is multiplexed with other functions. The pins and their combined functions are briefly described here. For specific information about individual functions such as the comparator or the A/D, refer to the appropriate section in this Data Sheet.

### 4.4.1.1 RC0/AN4/C2IN+

The RC0 is configurable to function as one of the following:

- a general purpose I/O
- an analog input for the A/D Converter
- the non-inverting input to comparator 2

### 4.4.1.2 RC6/AN8/OP1-

The RC6/AN8/OP1- pin is configurable to function as one of the following:

- a general purpose I/O
- an analog input for the A/D
- the inverting input for Op Amp 1

### 4.4.1.3 RC7/AN9/OP1+

The RC7/AN9/OP1+ pin is configurable to function as one of the following:

- a general purpose I/O
- an analog input for the A/D
- the non-inverting input for Op Amp 1

**FIGURE 4-10:** **BLOCK DIAGRAM OF RC0, RC6 AND RC7**

### 4.4.1.4 RC1/AN5/C12IN1-/PH1

The RC1 is configurable to function as one of the following:

- a general purpose I/O
- an analog input for the A/D Converter
- an analog input to comparators 1 & 2
- a digital output from the Two-Phase PWM

**FIGURE 4-11:** **BLOCK DIAGRAM OF RC1**

**Preliminary**                    © 2004 Microchip Technology Inc.

#### 4.4.1.5 RC2/AN6/C12IN2-/OP2

The RC2 is configurable to function as one of the following:

- a general purpose I/O
- an analog input for the A/D Converter
- an analog input to comparators 1 & 2
- an analog output from Op Amp 2

#### 4.4.1.6 RC3/AN7/C12IN3-/OP1

The RC3 is configurable to function as one of the following:

- a general purpose I/O
- an analog input for the A/D Converter
- an analog input to comparators 1 & 2
- an analog output for Op Amp 1

#### 4.4.1.7 RC4/C2OUT/PH2

The RC4 is configurable to function as one of the following:

- a general purpose I/O
- a digital output from comparator 2
- a digital output from the Two-Phase PWM

**FIGURE 4-13:** **BLOCK DIAGRAM OF RC4**

**FIGURE 4-12:** **BLOCK DIAGRAM OF RC2 AND RC3**
# PIC16F785

### 4.4.1.8    RC5/CCP1

The RC5 is configurable to function as one of the following:

• a general purpose I/O
• a digital input for the capture/compare
• a digital output for the CCP

**FIGURE 4-14:    BLOCK DIAGRAM OF RC5 PIN**

**Preliminary**

## 5.0    TIMER0 MODULE

The Timer0 module timer/counter has the following features:

• 8-bit timer/counter
• Readable and writable
• 8-bit software programmable prescaler
• Internal or external clock select
• Interrupt on overflow from FFh to 00h
• Edge select for external clock

Figure 5-1 is a block diagram of the Timer0 module and the prescaler shared with the WDT.

> **Note:** Additional information on the Timer0 module is available in the *PICmicro® Mid-Range Reference Manual*, (DS33023).

### 5.1    Timer0 Operation

Timer mode is selected by clearing the T0CS bit (OPTION_REG<5>). In Timer mode, the Timer0 module will increment every instruction cycle (without prescaler). If TMR0 is written, the increment is inhibited for the following two instruction cycles. The user can work around this by writing an adjusted value to the TMR0 register.

Counter mode is selected by setting the T0CS bit (OPTION_REG<5>). In this mode, the Timer0 module will increment either on every rising or falling edge of pin RA2/AN2/T0CKI/INT/C1OUT. The incrementing edge is determined by the source edge (T0SE) control bit (OPTION_REG<4>). Clearing the T0SE bit selects the rising edge.

> **Note 1:** Counter mode has specific external clock requirements. Additional information on these requirements is available in the *PICmicro® Mid-Range Reference Manual*, (DS33023).
>
> **2:** The ANSEL0 (91h) register must be initialized to configure an analog channel as a digital input. Pins configured as analog inputs will read '0'.

### 5.2    Timer0 Interrupt

A Timer0 interrupt is generated when the TMR0 register timer/counter overflows from FFh to 00h. This overflow sets the T0IF bit (INTCON<2>). The interrupt can be masked by clearing the T0IE bit (INTCON<5>). The T0IF bit must be cleared in software by the Timer0 module Interrupt Service Routine before re-enabling this interrupt. The Timer0 interrupt cannot wake the processor from Sleep since the timer is shut-off during Sleep.

**FIGURE 5-1:        BLOCK DIAGRAM OF THE TIMER0/WDT PRESCALER**

Note   1:   T0SE, T0CS, PSA, PS<2:0> are bits in the OPTION_REG (see Register 2-2 on page 16).
    2:   WDTPS<3:0> are bits in the WDTCON register (see Register 15-2 on page 118).
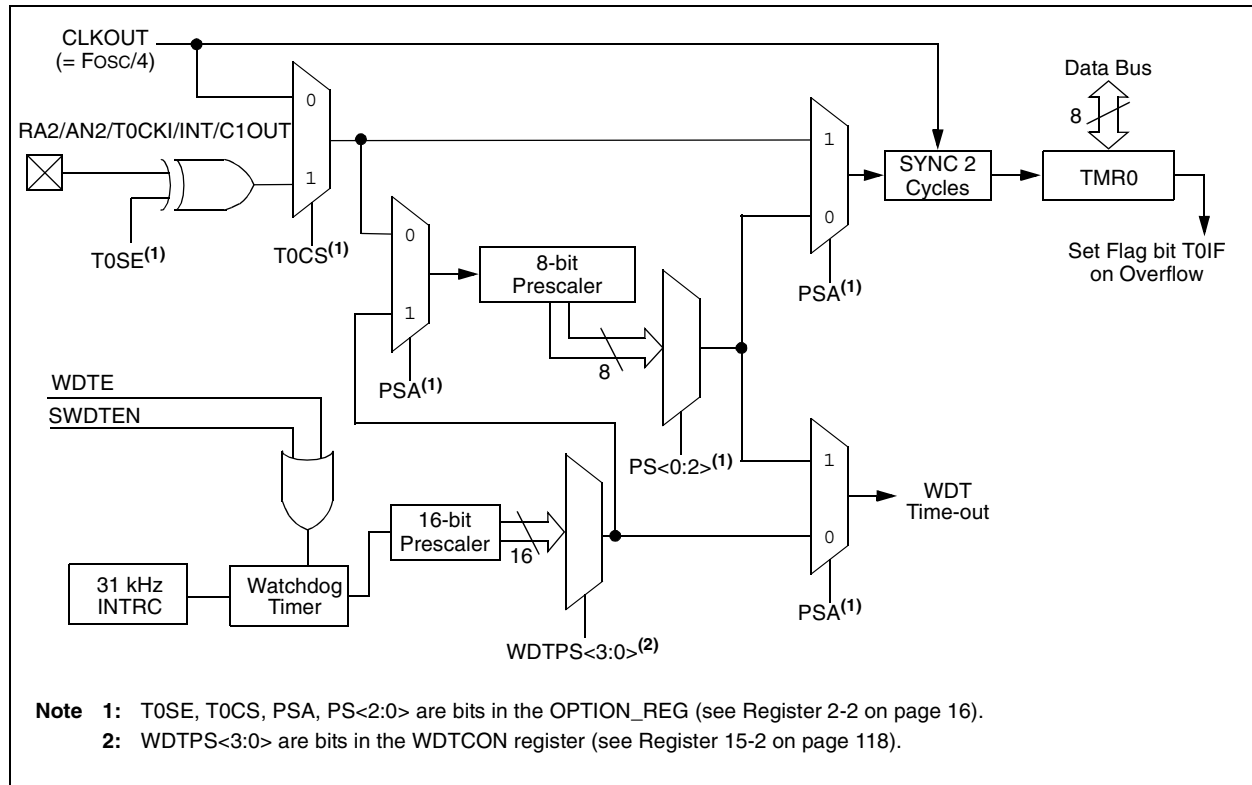

# PIC16F785

## 5.3 Using Timer0 with an External Clock

When no prescaler is used, the external clock input is the same as the prescaler output. The synchronization of T0CKI, with the internal phase clocks, is accomplished by sampling the prescaler output on the Q2 and Q4 cycles of the internal phase clocks. Therefore, it is necessary for T0CKI to be high for at least 2TOSC (and a small RC delay of 20 ns) and low for at least 2TOSC (and a small RC delay of 20 ns). Refer to the electrical specification of the desired device.

## 5.4 Prescaler

An 8-bit counter is available as a prescaler for the Timer0 module, or as a postscaler for the Watchdog Timer. For simplicity, this counter will be referred to as "prescaler" throughout this Data Sheet. The prescaler assignment is controlled in software by the control bit PSA (OPTION_REG<3>). Clearing the PSA bit will assign the prescaler to Timer0. Prescale values are selectable via the PS<2:0> bits (OPTION_REG<2:0>).

The prescaler is not readable or writable. When assigned to the Timer0 module, all instructions writing to the TMR0 register (e.g., `CLRF 1`, `MOVWF 1`, `BSF 1,x....etc.`) will clear the prescaler. When assigned to WDT, a `CLRWDT` instruction will clear the prescaler along with the Watchdog Timer.

### 5.4.1 SWITCHING PRESCALER ASSIGNMENT

The prescaler assignment is fully under software control (i.e., it can be changed "on the fly" during program execution). To avoid an unintended device Reset, the following instruction sequence (Example 5-2 and Example 5-3) must be executed when changing the prescaler assignment between Timer0 and WDT.

### EXAMPLE 5-2: CHANGING PRESCALER (TIMER0→WDT)

```
BCF     STATUS,RP0    ;Bank 0
BCF     STATUS,RP1    ;
CLRWDT                ;Clear WDT
CLRF    TMR0          ;Clear TMR0 and
                      ; prescaler
BSF     STATUS,RP0    ;Bank 1

MOVLW   b'00101111'   ;Required if desired
MOVWF   OPTION_REG    ; PS2:PS0 is
CLRWDT                ; 000 or 001
                      ;
MOVLW   b'00101xxx'   ;Set postscaler to
MOVWF   OPTION_REG    ; desired WDT rate
BCF     STATUS,RP0    ;Bank 0
```

To change prescaler from the WDT to the TMR0 module, use the sequence shown in Example 5-3. This precaution must be taken even if the WDT is disabled.

### EXAMPLE 5-3: CHANGING PRESCALER (WDT→TIMER0)

```
CLRWDT                ;Clear WDT and
                      ; prescaler
BSF     STATUS,RP0    ;Bank 1
BCF     STATUS,RP1    ;

MOVLW   b'xxxx0xxx'   ;Select TMR0,
                      ; prescale, and
                      ; clock source
MOVWF   OPTION_REG    ;
BCF     STATUS,RP0    ;Bank 0
```

## TABLE 5-1: REGISTERS ASSOCIATED WITH TIMER0

| 85h, 185h | TRISA | — | — | TRISA5 | TRISA4 | TRISA3 | TRISA2 | TRISA1 | TRISA0 | --11 1111 | --11 1111 |

**Legend:** — = Unimplemented locations, read as '0', u = unchanged, x = unknown. Shaded cells are not used by the Timer0 module.

# 6.0 TIMER1 MODULE WITH GATE CONTROL

The Timer1 module is the 16 bit counter of the PIC16F785. Figure 6-1 shows the basic block diagram of the Timer1 module. Timer1 has the following features:

- 16-bit timer/counter (TMR1H:TMR1L)
- Readable and writable
- Internal or external clock selection
- Synchronous or asynchronous operation
- Interrupt on overflow from FFFFh to 0000h
- Wake-up upon overflow (Asynchronous mode)
- Optional external enable input
  - Selectable gate source; T1G or C2 output (T1GSS)
  - Selectable gate polarity (T1GINV)
- Optional LP oscillator

The Timer1 Control register (T1CON), shown in Register 6-1, is used to enable/disable Timer1 and select the various features of the Timer1 module.

| Note: | Additional information on timer modules is available in the *PICmicro® Mid-Range Reference Manual*, (DS33023). |
|---|---|

## FIGURE 6-1: TIMER1 ON THE PIC16F785 BLOCK DIAGRAM

* ST Buffer is low power type when using LP OSC, or high-speed type when using T1CKI.

Note 1: Timer 1 increments on the rising edge.

2: SYNCC2OUT is the synchronized output from comparator 2 (see Figure 9-2 on page 64).

# PIC16F785

## 6.1 Timer1 Modes of Operation

Timer1 can operate in one of three modes:

- 16-bit Timer with prescaler
- 16-bit Synchronous counter
- 16-bit Asynchronous counter

In Timer mode, Timer1 is incremented on every instruction cycle. In Counter mode, Timer1 is incremented on the rising edge of the external clock input T1CKI. In addition, the Counter mode clock can be synchronized to the microcontroller system clock or run asynchronously.

In Counter and Timer modules, the counter/timer clock can be gated by the Timer 1 gate, which can be selected as either the T1G pin or Comparator 2 output.

If an external clock oscillator is needed (and the microcontroller is using the LP oscillator or INTOSC without CLKOUT), Timer1 can use the LP oscillator as a clock source.

> **Note:** In Counter mode, a falling edge must be registered by the counter prior to the first incrementing rising edge.

## 6.2 Timer1 Interrupt

The Timer1 register pair (TMR1H:TMR1L) increments to FFFFh and rolls over to 0000h. When Timer1 rolls over, the Timer1 interrupt flag bit (PIR1<0>) is set. To enable the interrupt on rollover, you must set these bits:

- Timer1 interrupt Enable bit (PIE1<0>)
- PEIE bit (INTCON<6>)
- GIE bit (INTCON<7>)

The interrupt is cleared by clearing the TMR1IF in the Interrupt Service Routine.

> **Note:** The TMR1H:TMR1L register pair and the TMR1IF bit should be cleared before enabling interrupts.

## 6.3 Timer1 Prescaler

Timer1 has four prescaler options allowing 1, 2, 4, or 8 divisions of the clock input. The T1CKPS bits (T1CON<5:4>) control the prescale counter. The prescale counter is not directly readable or writable; however, the prescaler counter is cleared upon a write to TMR1H or TMR1L.

## 6.4 Timer1 Gate

Timer1 gate source is software configurable to be T1G pin or the output of Comparator 2. This allows the device to directly time external events using T1G or analog events using Comparator 2. See CM2CON1 (Register 9-3) for selecting the Timer1 gate source. This feature can simplify the software for a Delta-Sigma A/D Converter and many other applications. For more information on Delta-Sigma A/D Converters, see the Microchip web site (www.microchip.com).

> **Note:** TMR1GE bit (T1CON<6>) must be set to use either T1G or C2OUT as the Timer1 gate source. See Register 9-3 for more information on selecting the Timer1 gate source.

Timer1 gate can be inverted using the T1GINV bit (T1CON<7>), whether it originates from the T1G pin or Comparator 2 output. This configures Timer1 to measure either the active high or active low time between events.

**FIGURE 6-2: TIMER1 INCREMENTING EDGE**

Note 1: Arrows indicate counter increments.
2: In Counter mode, a falling edge must be registered by the counter prior to the first incrementing rising edge of the clock.

**Preliminary**
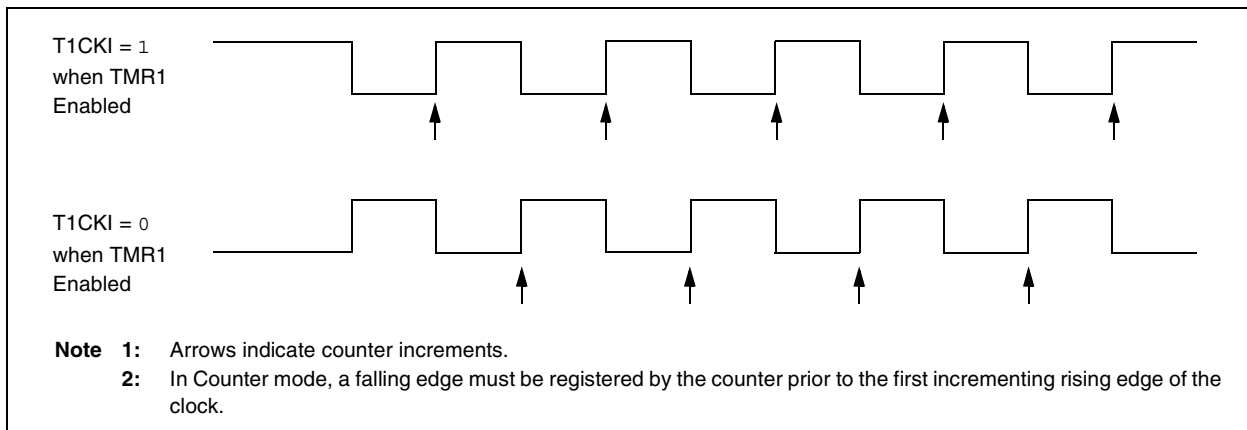

**REGISTER 6-1:** **T1CON — TIMER1 CONTROL REGISTER (ADDRESS: 10h)**

| R/W-0 | R/W-0 | R/W-0 | R/W-0 | R/W-0 | R/W-0 | R/W-0 | R/W-0 |

bit 7                                                        bit 0

bit 7      **T1GINV:** Timer1 Gate Invert bit [1]

                1 = Timer1 gate is high true (see bit 6)
                0 = Timer1 gate is low true (see bit 6)

bit 6      **TMR1GE:** Timer1 Gate Enable bit [2]
                <u>If TMR1ON = 0:</u>
                This bit is ignored
                <u>If TMR1ON = 1:</u>
                1 = Timer1 is on if Timer1 gate is true (see bit 7)
                0 = Timer1 is on independent of Timer1 gate

bit 5-4      **T1CKPS<1:0>:** Timer1 Input Clock Prescale Select bits
                11 = 1:8 Prescale Value
                10 = 1:4 Prescale Value
                01 = 1:2 Prescale Value
                00 = 1:1 Prescale Value

bit 3      **T1OSCEN:** LP Oscillator Enable Control bit
                <u>If System Clock is INTOSC without CLKOUT or LP mode:</u>
                1 = LP oscillator is enabled for Timer1 clock
                0 = LP oscillator is off
                <u>Else:</u>
                This bit is ignored

bit 2      **$\overline{\text{T1SYNC}}$:** Timer1 External Clock Input Synchronization Control bit
                <u>TMR1CS = 1:</u>
                1 = Do not synchronize external clock input
                0 = Synchronize external clock input
                <u>TMR1CS = 0:</u>
                This bit is ignored. Timer1 uses the internal clock.

bit 1      **TMR1CS:** Timer1 Clock Source Select bit
                1 = External clock from T1CKI pin (on the rising edge)
                0 = Internal clock (F$_{OSC}$/4)

bit 0      **TMR1ON:** Timer1 On bit
                1 = Enables Timer1
                0 = Stops Timer1

        **Note 1:** T1GINV bit inverts the Timer1 gate logic, regardless of source.
              **2:** TMR1GE bit must be set to use either T1G pin or C2OUT, as selected by T1GSS bit (CM2CON1<1>), as a Timer1 gate source.

# PIC16F785

## 6.5 Timer1 Operation in Asynchronous Counter Mode

If control bit T1SYNC (T1CON<2>) is set, the external clock input is not synchronized. The timer continues to increment asynchronous to the internal phase clocks. The timer will continue to run during Sleep and can generate an interrupt on overflow, which will wake-up the processor. However, special precautions in software are needed to read/write the timer (**Section 6.5.1 "Reading and Writing Timer1 in Asynchronous Counter Mode"**).

> **Note:** The ANSEL0 (91h) register must be initialized to configure an analog channel as a digital input. Pins configured as analog inputs will read '0'.

### 6.5.1 READING AND WRITING TIMER1 IN ASYNCHRONOUS COUNTER MODE

Reading TMR1H or TMR1L while the timer is running from an external asynchronous clock will ensure a valid read (taken care of in hardware). However, the user should keep in mind that reading the 16-bit timer in two 8-bit values itself, poses certain problems, since the timer may overflow between the reads.

For writes, it is recommended that the user simply stop the timer and write the desired values. A write contention may occur by writing to the timer registers, while the register is incrementing. This may produce an unpredictable value in the timer register.

Reading the 16-bit value requires some care. Examples in the *PICmicro® Mid-Range MCU Family Reference Manual* (DS33023) show how to read and write Timer1 when it is running in Asynchronous mode.

## 6.6 Timer1 Oscillator

A crystal oscillator circuit is built-in between pins OSC1 (input) and OSC2 (amplifier output). It is enabled by setting control bit T1OSCEN (T1CON<3>). The oscillator is a low power oscillator rated for 32.768 kHz. It will continue to run during Sleep. It is primarily intended for a 32.768 kHz tuning fork crystal.

The Timer1 oscillator is shared with the system LP oscillator. Thus, Timer1 can use this mode only when the primary system clock is also the LP oscillator or is derived from the internal oscillator. As with the system LP oscillator, the user must provide a software time delay to ensure proper oscillator start-up.

SLEEP mode will not disable the system clock when the system clock and Timer1 share the LP oscillator.

TRISA<5> and TRISA<4> bits are set when the Timer1 oscillator is enabled. RA5 and RA4 read as '0' and TRISA<5> and TRISA<4> bits read as '1'.

> **Note:** The oscillator requires a start-up and stabilization time before use. Thus, T1OSCEN should be set and a suitable delay observed prior to enabling Timer 1.

## 6.7 Timer1 Operation During Sleep

Timer1 can only operate during Sleep when setup in Asynchronous Counter mode. In this mode, an external crystal or clock source can be used to increment the counter. To setup the timer to wake the device:

- Timer1 must be on (T1CON<0>)
- TMR1IE bit (PIE1<0>) must be set
- PEIE bit (INTCON<6>) must be set

The device will wake-up on an overflow. If the GIE bit (INTCON<7>) is set, the device will wake-up and jump to the Interrupt Service Routine (0004h) on an overflow. If the GIE bit is clear, execution will continue with the next instruction.

## TABLE 6-1: REGISTERS ASSOCIATED WITH TIMER1

## 7.0    TIMER2 MODULE

The Timer2 module timer is an 8-bit timer with the following features:

- 8-bit timer (TMR2 register)
- 8-bit period register (PR2)
- Readable and writable (both registers)
- Software programmable prescaler (1:1, 1:4, 1:16)
- Software programmable postscaler (1:1 to 1:16 by 1's)
- Interrupt on TMR2 match with PR2

Timer2 has a control register shown in Register 7-1. TMR2 can be shut-off by clearing control bit TMR2ON (T2CON<2>) to minimize power consumption. Figure 7-1 is a simplified block diagram of the Timer2 module. The prescaler and postscaler selection of Timer2 are controlled by this register.

## 7.1    Timer2 Operation

Timer2 can be used as the PWM time base for the PWM mode of the CCP module. The TMR2 register is readable and writable, and is cleared on any device Reset. The input clock ($F_{OSC}/4$) has a prescale option of 1:1, 1:4 or 1:16, selected by control bits T2CKPS<1:0> (T2CON<1:0>). The match output of TMR2 goes through a 4-bit postscaler (which gives a 1:1 to 1:16 scaling inclusive) to generate a TMR2 interrupt (latched in flag bit TMR2IF, (PIR1<1>)).

The prescaler and postscaler counters are cleared when any of the following occurs:

- A write to the TMR2 register
- A write to the T2CON register
- Any device Reset (Power-on Reset, $\overline{MCLR}$ Reset, Watchdog Timer Reset or Brown-out Reset)

TMR2 is not cleared when T2CON is written.

**REGISTER 7-1:    T2CON — TIMER2 CONTROL REGISTER (ADDRESS: 12h)**

| - n = Value at POR | '1' = Bit is set | '0' = Bit is cleared    x = Bit is unknown |

## 7.2 Timer2 Interrupt

The Timer2 module has an 8-bit period register, PR2. Timer2 increments from 00h until it matches PR2 and then resets to 00h on the next increment cycle. PR2 is a readable and writable register. The PR2 register is initialized to FFh upon Reset.

## 8.0 CAPTURE/COMPARE/PWM (CCP) MODULE

The Capture/Compare/PWM (CCP) module contains a 16-bit register which can operate as a:

• 16-bit Capture register
• 16-bit Compare register
• PWM Master/Slave Duty Cycle register

Capture/Compare/PWM Register1 (CCPR1) is comprised of two 8-bit registers: CCPR1L (low byte) and CCPR1H (high byte). The CCP1CON register controls the operation of CCP. The special event trigger is generated by a compare match and will clear both TMR1H and TMR1L registers.

**TABLE 8-1: CCP MODE - TIMER RESOURCES REQUIRED**

| CCP Mode | Timer Resource |
|----------|----------------|
| Capture | Timer1 |
| Compare | Timer1 |
| PWM | Timer2 |

**REGISTER 8-1: CCP1CON — CCP OPERATION REGISTER (ADDRESS: 15h)**

| U-0 | U-0 | R/W-0 | R/W-0 | R/W-0 | R/W-0 | R/W-0 | R/W-0 |

# PIC16F785

## 8.1 Capture Mode

In Capture mode, CCPR1H:CCPR1L captures the 16-bit value of the TMR1 register when an event occurs on pin RC5/CCP1. An event is defined as one of the following and is configured by CCP1CON<3:0>:

- Every falling edge
- Every rising edge
- Every 4th rising edge
- Every 16th rising edge

When a capture is made, the interrupt request flag bit CCP1IF (PIR1<5>) is set. The interrupt flag must be cleared in software. If another capture occurs before the value in register CCPR1 is read, the old captured value is overwritten by the new captured value.

### 8.1.1 CCP1 PIN CONFIGURATION

In Capture mode, the RC5/CCP1 pin should be configured as an input by setting the TRISC<5> bit.

> Note: If the RC5/CCP1 pin is configured as an output, a write to the port can cause a capture condition.

**FIGURE 8-1: CAPTURE MODE OPERATION BLOCK DIAGRAM**

### 8.1.2 TIMER1 MODE SELECTION

Timer1 must be running in Timer mode or Synchronized Counter mode for the CCP module to use the capture feature. In Asynchronous Counter mode, the capture operation may not work.

### 8.1.3 SOFTWARE INTERRUPT

When the Capture mode is changed, a false capture interrupt may be generated. The user should keep bit CCP1IE (PIE1<5>) clear to avoid false interrupts and should clear the flag bit CCP1IF (PIR1<5>) following any such change in Operating mode.

### 8.1.4 CCP PRESCALER

There are four prescaler settings specified by bits CCP1M<3:0> (CCP1CON<3:0>). Whenever the CCP module is turned off, or the CCP module is not in Capture mode, the prescaler counter is cleared. Any Reset will clear the prescaler counter.

Switching from one capture prescaler to another may generate an interrupt. Also, the prescaler counter will not be cleared, therefore, the first capture may be from a non-zero prescaler. Example 8-1 shows the recommended method for switching between capture prescalers. This example also clears the prescaler counter and will not generate the "false" interrupt.

**EXAMPLE 8-1: CHANGING BETWEEN CAPTURE PRESCALERS**

```
CLRF    CCP1CON     ;Turn CCP module off
MOVLW   NEW_CAPT_PS ;Load the W reg with
                    ; the new prescaler
                    ; move value and CCP ON
MOVWF   CCP1CON     ;Load CCP1CON with this
                    ; value
```

**Preliminary**

## 8.2 Compare Mode

In Compare mode, the 16-bit CCPR1 register value is constantly compared against the TMR1 register pair value. When a match occurs, the RC5/CCP1 pin is:

• Driven high
• Driven low
• Remains unchanged

The action on the pin is based on the value of control bits CCP1M<3:0> (CCP1CON<3:0>). At the same time, interrupt flag bit CCP1IF (PIR1<5>) is set.

**FIGURE 8-2:** **COMPARE MODE OPERATION BLOCK DIAGRAM**

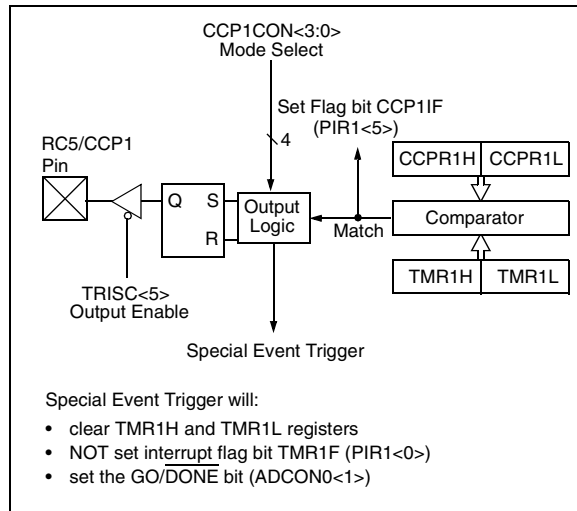

### 8.2.1 CCP1 PIN CONFIGURATION

The user must configure the RC5/CCP1 pin as an output by clearing the TRISC<5> bit.

| Note: | Clearing the CCP1CON register will force the RC5/CCP1 compare output latch to the default low level. This is not the PORTC I/O data latch. |
|---|---|

### 8.2.2 TIMER1 MODE SELECTION

Timer1 must be running in Timer mode or Synchronized Counter mode if the CCP module is using the compare feature. In Asynchronous Counter mode, the compare operation may not work.

### 8.2.3 SOFTWARE INTERRUPT MODE

When Generate Software Interrupt mode is chosen (CCP1M<3:0> = 1010), the RC5/CCP1 pin is not affected. The CCP1IF (PIR1<5>) bit is set, causing a CCP interrupt (if enabled). See Register 8-1.

### 8.2.4 SPECIAL EVENT TRIGGER

In this mode (CCP1M<3:0> = 1011), an internal hardware trigger is generated, which may be used to initiate an action. See Register 8-1.

The special event trigger output of CCP resets the TMR1 register pair. This allows the CCPR1 register to effectively be a 16-bit programmable period register for Timer1. The special event trigger output also starts an A/D conversion (if the A/D module is enabled).

| Note: | The special event trigger from the CCP module will not set interrupt flag bit TMR1IF (PIR1<0>). |
|---|---|

# PIC16F785

## 8.3 CCP PWM Mode

In Pulse Width Modulation (PWM) mode, the CCP module produces up to a 10-bit resolution PWM output on the RC5/CCP1 pin. Since the RC5/CCP1 pin is multiplexed with the PORTC data latch, the TRISC<5> must be cleared to make the RC5/CCP1 pin an output.

> Note: Clearing the CCP1CON register will force the PWM output latch to the default inactive levels. This is not the PORTC I/O data latch.

Figure 8-3 shows a simplified block diagram of PWM operation.

For a step by step procedure on how to set up the CCP module for PWM operation, see **Section 8.3.5 "Setup for PWM Operation"**.

### FIGURE 8-3: SIMPLIFIED PWM BLOCK DIAGRAM

**Note 1:** The 8-bit timer TMR2 register is concatenated with the 2-bit internal Q clock, or 2 bits of the prescaler, to create the 10-bit time base.

The PWM output (Figure 8-4) has a time base (period) and a time that the output stays high (duty cycle). The frequency of the PWM is the inverse of the period (1/period).

### FIGURE 8-4: CCP PWM OUTPUT

### 8.3.1 PWM PERIOD

The PWM period is specified by writing to the PR2 register. The PWM period can be calculated using the formula of Equation 8-1.

### EQUATION 8-1:

$$PWM\ period\ =\ [(PR2) + 1] \bullet 4 \bullet T_{OSC} \bullet$$
$$(TMR2\ prescale\ value)$$

PWM frequency is defined as 1 / [PWM period].

When TMR2 is equal to PR2, the following three events occur on the next increment cycle:

- TMR2 is cleared
- The RC5/CCP1 pin is set. (exception: if PWM duty cycle = 0%, the pin will not be set)
- The PWM duty cycle is latched from CCPR1L into CCPR1H

> Note: The Timer2 postscaler (see **Section 7.1 "Timer2 Operation"**) is not used in the determination of the PWM frequency. The postscaler could be used to have a servo update rate at a different frequency than the PWM output.

### 8.3.2 PWM DUTY CYCLE

The PWM duty cycle is specified by writing to the CCPR1L register and to the DC1B<1:0> (CCP1CON<5:4>) bits. Up to 10 bits of resolution is available. The CCPR1L contains the eight MSbs and the DC1B<1:0> contains the two LSbs. CCPR1L and DC1B<1:0> can be written to at any time. In PWM mode, CCPR1H is a read-only register. This 10-bit value is represented by CCPR1L (CCP1CON<5:4>).

Equation 8-2 is used to calculate the PWM duty cycle in time.

### EQUATION 8-2:

$$PWM\ duty\ cycle\ =\ (CCPR1L:CCP1CON<5:4>) \bullet$$
$$T_{OSC} \bullet (TMR2\ prescale\ value)$$

CCPR1L and DC1B<1:0> can be written to at any time, but the duty cycle value is not latched into CCPR1H until after a match between PR2 and TMR2 occurs (i.e. the period is complete). In PWM mode, CCPR1H is a read only register.

The CCPR1H register and a 2-bit internal latch are used to double buffer the PWM duty cycle. This double buffering is essential for glitchless PWM operation.

Because of the buffering, the module waits until the timer resets, instead of starting immediately. This means that enhanced PWM waveforms do not exactly match the standard PWM waveforms, but are instead offset by one full instruction cycle (4 TOSC).

When the CCPR1H and 2-bit latch match TMR2, concatenated with an internal 2-bit Q clock or 2 bits of the TMR2 prescaler, the RC5/CCP1 pin is cleared.

The maximum PWM resolution is a function of PR2 as shown by Equation 8-3.

**EQUATION 8-3:**

$$Resolution = \frac{\log[4(PR2+1)]}{\log(2)} \text{ bits}$$

Note: If the PWM duty cycle value is longer than the PWM period, the assigned PWM pin(s) will remain unchanged.

**TABLE 8-3: EXAMPLE PWM FREQUENCIES AND RESOLUTIONS (FOSC = 20 MHz)**

| PWM Frequency | 1.22 kHz[1] | 4.88 kHz[1] | 19.53 kHz | 78.12 kHz | 156.3 kHz | 208.3 kHz |
|---|---|---|---|---|---|---|
| Timer Prescale (1, 4, 16) | 16 | 4 | 1 | 1 | 1 | 1 |
| PR2 Value | 0xFF | 0xFF | 0xFF | 0x3F | 0x1F | 0x17 |
| Maximum Resolution (bits) | 10 | 10 | 10 | 8 | 7 | 6.6 |

**Note 1:** Changing duty cycle will cause a glitch.

### 8.3.3 OPERATION IN SLEEP MODE

In Sleep mode, all clock sources are disabled. Timer2 will not increment, and the state of the module will not change. If the RC5/CCP1 pin is driving a value, it will continue to drive that value. When the device wakes up, it will continue from this state.

#### 8.3.3.1 OPERATION WITH FAIL-SAFE CLOCK MONITOR

If the Fail-Safe Clock Monitor is enabled, a clock failure will force the CCP to be clocked from the internal oscillator clock source, which may have a different clock frequency than the primary clock.

See **Section 3.0 "Clock Sources"** for additional details.

### 8.3.4 EFFECTS OF A RESET

Any Reset will force all ports to Input mode and the CCP registers to their Reset states.

### 8.3.5 SETUP FOR PWM OPERATION

The following steps should be taken when configuring the CCP module for PWM operation:

1. Configure the PWM pin (RC5/CCP1) as an input by setting the TRISC<5> bit.
2. Set the PWM period by loading the PR2 register.
3. Configure the CCP module for the PWM mode by loading the CCP1CON register with the appropriate values.
4. Set the PWM duty cycle by loading the CCPR1L register and CCP1CON<5:4> bits.
5. Configure and start TMR2:
   - Clear the TMR2 interrupt flag bit by clearing the TMR2IF bit (PIR1<1>).
   - Set the TMR2 prescale value by loading the T2CKPS bits (T2CON<1:0>).
   - Enable Timer2 by setting the TMR2ON bit (T2CON<2>).
6. Enable PWM output after a new PWM cycle has started:
   - Wait until TMR2 overflows (TMR2IF bit is set).
   - Enable the RC5/CCP1 pin output by clearing the TRISC<5> bit.

## 9.0    COMPARATOR MODULE

The comparator module has two separate voltage comparators: Comparator C1 and Comparator C2.

Each comparator offers the following list of features:

- Control and configuration register
- Comparator output available externally
- Programmable output polarity
- Interrupt-on-change flags
- Wake-up from SLEEP
- Configurable as feedback input to the PWM
- Programmable four input multiplexer
- Programmable two input reference selections
- Programmable speed/power
- Output synchronization to Timer1 clock input (Comparator C2 only)

### 9.1    Control Registers

Both comparators have separate control and configuration registers: CM1CON0 for C1 and CM2CON0 for C2. In addition, Comparator C2 has a second control register, CM2CON1, for synchronization control and simultaneous reading of both comparator outputs.

#### 9.1.1    COMPARATOR C1 CONTROL REGISTER

The CM1CON0 register (shown in Register 9-1) contains the control and Status bits for the following:

- Comparator enable
- Comparator input selection
- Comparator reference selection
- Output mode
- Comparator speed

Setting C1ON (CM1CON0<7>) enables Comparator C1 for operation.

Bits C1CH<1:0> (CM1CON0<1:0>) select the comparator input from the four analog pins AN<7:5,1>.

| Note: | To use AN<7:5,1> as analog inputs the appropriate bits must be programmed to '1' in the ANSEL0 register. |
|---|---|

Setting C1R (CM1CON0<2>) selects the C1V$_{REF}$ output of the comparator voltage reference module as the reference voltage for the comparator. Clearing C1R selects the C1IN+ input on the RA0/AN0/C1IN+/ICSPDAT pin.

The output of the comparator is available internally via the C1OUT flag (CM1CON0<6>). To make the output available for an external connection, the C1OE bit (CM1CON0<5>) must be set.

The polarity of the comparator output can be inverted by setting the C1POL bit (CM1CON0<4>). Clearing C1POL results in a non-inverted output.

A complete table showing the output state versus input conditions and the polarity bit is shown in Table 9-1.

**TABLE 9-1:    C1OUTPUT STATE VERSUS INPUT CONDITIONS**

| Input Condition | C1POL | C1OUT |
|---|---|---|
| C1VN > C1VP | 0 | 0 |
| C1VN < C1VP | 0 | 1 |
| C1VN > C1VP | 1 | 1 |
| C1VN < C1VP | 1 | 0 |

| Note 1: | The internal output of the comparator is latched at the end of each instruction cycle. External outputs are not latched. |
|---|---|
| 2: | The C1 interrupt will operate correctly with C1OE set or cleared. |
| 3: | To output C1 on RA2/AN2/T0CKI/INT/C1OUT: (C1OE=1) & (C1ON=1) & (TRISA<2>=0). |

C1SP (CM1CON0<3>) configures the speed of the comparator. When C1SP is set, the comparator operates at its normal speed. Clearing C1SP operates the comparator in a slower, low-power mode.

# PIC16F785

**FIGURE 9-1:** **COMPARATOR C1 SIMPLIFIED BLOCK DIAGRAM**

**Note 1:** When C1ON = 0, the C1 comparator will produce a '0' output to the XOR Gate.

### 9.1.2 COMPARATOR C2 CONTROL REGISTERS

The CM2CON0 register is a functional copy of the CM1CON0 register described in Section 9.1.1. A second control register, CM2CON1, is also present for control of an additional synchronizing feature, as well as mirrors of both comparator outputs.

#### 9.1.2.1 Control Register CM2CON0

The CM2CON0 register, shown in Register 9-2, contains the control and Status bits for Comparator C2.

Setting C2ON (CM2CON0<7>) enables Comparator C2 for operation.

Bits C2CH<1:0> (CM2CON0<1:0>) select the comparator input from the four analog pins, AN<7:5,1>.

> **Note 1:** To use AN<7:5,1> as analog inputs, the appropriate bits must be programmed to `1` in the ANSEL0 register.

C2R (CM2CON0<2>) selects the reference to be used with the comparator. Setting C2R (CM2CON0<2>) selects the C2VREF output of the comparator voltage reference module as the reference voltage for the comparator. Clearing C2R selects the C2IN+ input on the RC0/AN4/C2IN+ pin.

The output of the comparator is available internally via the C2OUT bit (CM2CON0<6>). To make the output available for an external connection, the C2OE bit (CM2CON0<5>) must be set.

The comparator output, C2OUT, can be inverted by setting the C2POL bit (CM2CON0<4>). Clearing C2POL results in a non-inverted output.

A complete table showing the output state versus input conditions and the polarity bit is shown in Table 9-2.

**TABLE 9-2: C2 OUTPUT STATE VERSUS INPUT CONDITIONS**

| Input Condition | C2POL | C2OUT |
|---|---|---|
| C2VN > C2VP | 0 | 0 |
| C2VN < C2VP | 0 | 1 |
| C2VN > C2VP | 1 | 1 |
| C2VN < C2VP | 1 | 0 |

> **Note 1:** The internal output of the comparator is latched at the end of each instruction cycle. External outputs are not latched.
> **2:** The C2 interrupt will operate correctly with C2OE set or cleared. An external output is not required for the C2 interrupt.
> **3:** For C2 output on RC4/C2OUT/PH2: (C2OE=1) & (C2ON=1) & (TRISA<4>=0).

C2SP (CM2CON0<3>) configures the speed of the comparator. When C2SP is set, the comparator operates at its normal speed. Clearing C2SP operates the comparator in low-power mode.

**FIGURE 9-2: COMPARATOR C2 SIMPLIFIED BLOCK DIAGRAM**

**Note 1:** When C2ON = 0, the C2 comparator will produce a '0' output to the XOR Gate.

### 9.1.2.2 Control Register CM2CON1

Comparator C2 has one additional feature: its output can be synchronized to the Timer1 clock input. Setting C2SYNC (CM2CON1<0>) synchronizes the output of Comparator 2 to the falling edge of Timer 1's clock input (see Figure 9-2 and Register 9-3).

The CM2CON1 register also contains mirror copies of both comparator outputs, MC1OUT and MC2OUT (CM2CON1<7:6>). The ability to read both outputs simultaneously from a single register eliminates the timing skew of reading separate registers.

> **Note 1:** Obtaining the status of C1OUT or C2OUT by reading CM1CON1 does not affect the comparator interrupt mismatch registers.

**REGISTER 9-3:    COMPARATOR C2 CONTROL REGISTER 1 (CM2CON1: 11Bh)**

| R-0 | R-0 | U-0 | U-0 | U-0 | U-0 | R/W-1 | R/W-0 |

**Preliminary**

## 9.2 Comparator Outputs

The comparator outputs are read through the CM1CON0, COM2CON0 or CM2CON1 registers. CM1CON0 and CM2CON0 each contain the individual comparator output of comparator 1 and comparator 2, respectively. CM2CON2 contains a mirror copy of both comparator outputs facilitating a simultaneous read of both comparators. These bits are read-only. The comparator outputs may also be directly output to the RA2/AN2/T0CKI/INT/C1OUT and RC4/C2OUT/PH2 I/O pins. When enabled, multiplexers in the output path of the RA2 and RC4 pins will switch and the output of each pin will be the unsynchronized output of the comparator. The uncertainty of each of the comparators is related to the input offset voltage and the response time given in the specifications. Figure 9-1 and Figure 9-2 show the output block diagrams for Comparators 1 and 2, respectively.

The TRIS bits will still function as an output enable/disable for the RA2/AN2/T0CKI/INT/C1OUT and RC4/C2OUT/PH2 pins while in this mode.

The polarity of the comparator outputs can be changed using the C1POL and C2POL bits (CMxCON0<4>).

Timer1 gate source can be configured to use the T1G pin or Comparator 2 output as selected by the T1GSS bit (CM2CON1<1>). The Timer1 gate feature can be used to time the duration or interval of analog events. The output of Comparator 2 can also be synchronized with Timer1 by setting the C2SYNC bit (CM2CON1<0>). When enabled, the output of Comparator 2 is latched on the falling edge of Timer1 clock source. If a prescaler is used with Timer1, Comparator 2 is latched after the prescaler. To prevent a race condition, the Comparator 2 output is latched on the falling edge of the Timer1 clock source and Timer1 increments on the rising edge of its clock source. See the Comparator 2 Block Diagram (Figure 9-2) and the Timer1 Block Diagram (Figure 6-1) for more information.

It is recommended to synchronize Comparator 2 with Timer1 by setting the C2SYNC bit when Comparator 2 is used as the Timer1 gate source. This ensures Timer1 does not miss an increment if Comparator 2 changes during an increment.

## 9.3 Comparator Interrupts

The comparator interrupt flags are set whenever there is a change in the output value of its respective comparator. Software will need to maintain information about the status of the output bits, as read from CM2CON0<7:6>, to determine the actual change that has occurred. The CxIF bits, PIR1<4:3>, are the Comparator Interrupt Flags. Each comparator interrupt bit must be reset in software by clearing it to '0'. Since it is also possible to write a '1' to this register, a simulated interrupt may be initiated.

The CxIE bits (PIE1<4:3>) and the PEIE bit (INTCON<6>) must be set to enable the interrupts. In addition, the GIE bit must also be set. If any of these bits are cleared, the interrupt is not enabled, though the CxIF bits will still be set if an interrupt condition occurs.

The comparator interrupt of the PIC16F785 differs from previous designs in that the interrupt flag is set by the mismatch edge and not the mismatch level. This means that the interrupt flag can be reset without the additional step of reading or writing the CMxCON0 register to clear the mismatch registers. When the mismatch registers are not cleared, an interrupt will not occur when the comparator output returns to the previous state. When the mismatch registers are cleared, an interrupt will occur when the comparator returns to the previous state.

> **Note 1:** If a change in the CMxCON0 register (CxOUT) should occur when a read operation is being executed (start of the Q2 cycle), then the CxIF (PIR1<4:3>) interrupt flag may not get set.
>
> **2:** When either comparator is first enabled, bias circuitry in the comparator module may cause an invalid output from the comparator until the bias circuitry is stable. Allow about 1 μs for bias settling then clear the mismatch condition and interrupt flags before enabling comparator interrupts.

## 9.4 Effects of RESET

A RESET forces all registers to their RESET state. This disables both comparators.

**NOTES:**

**Preliminary**

## 10.0 VOLTAGE REFERENCES

There are two voltage references available in the PIC16F785: The voltage referred to as the comparator reference (CVREF) is a variable voltage based on VDD; The voltage referred to as the VR reference (VR) is a fixed voltage derived from a stable bandgap source. Each source may be individually routed internally to the comparators or output, buffered or unbuffered, on the RA1/AN1/C12IN0-/VREF/ICSPCLK pin.

### 10.1 Comparator Reference

The comparator module also allows the selection of an internally generated voltage reference for one of the comparator inputs. The VRCON register (Register 10-1) controls the voltage reference module shown in Figure 10-1.

#### 10.1.1 CONFIGURING THE VOLTAGE REFERENCE

The voltage reference can output 32 distinct voltage levels, 16 in a high range and 16 in a low range.

The following equation determines the output voltages:

**EQUATION 10-1:**

$VRR = 1$  *(low range):*

   $CVREF = VR<3:0> \text{ x } VDD/24$

$VRR = 0$  *(high range):*

   $CVREF = (VDD/4) + (VR<3:0> \text{ x } VDD/32)$

#### 10.1.2 VOLTAGE REFERENCE ACCURACY/ERROR

The full range of VSS to VDD cannot be realized due to the construction of the module. The transistors on the top and bottom of the resistor ladder network (Figure 10-1) keep CVREF from approaching VSS or VDD. The exception is when the module is disabled by clearing all CVROE, C1VREN and C2VREN bits. When disabled, the reference voltage is VSS when VR<3:0> is '0000' and the VRR (VRCON<5>) bit is set. This allows the comparators to detect a zero-crossing and not consume CVREF module current.

The voltage reference is VDD derived and therefore, the CVREF output changes with fluctuations in VDD. The tested absolute accuracy of the comparator voltage reference can be found in Table 18-8.

**FIGURE 10-1:     COMPARATOR VOLTAGE REFERENCE BLOCK DIAGRAM**

## 10.2 VR REFERENCE MODULE

The VR Reference Module generates a 1.2V nominal output voltage for use by the ADC and comparators. The output voltage can also be brought out to the VREF pin for user applications. This module uses a Bandgap as a reference. See Table 18-9 for detailed specifications. Register 10-2 shows the control register for the VR module.

**REGISTER 10-2: VOLTAGE REFERENCE CONTROL REGISTER (REFCON: 98h)**

### 10.2.1 VR STABILIZATION PERIOD

When the voltage reference module is enabled, it will require some time for the reference and its amplifier circuits to stabilize. The user program must include a small delay routine to allow the module to settle. See the electrical specifications section for the minimum delay requirement.

The internal circuitry automatically recognizes when the voltage reference is required by the combination and purpose of various SFR control bits. The VREN enable bit allows the user to keep the voltage reference enabled even when SFR control bits would otherwise disable the reference. This precludes the need to wait for the voltage reference to stabilize when modules are switched in and out of service.

## 11.0 OPERATIONAL AMPLIFIER (OPA) MODULE

The OPA module has the following features:

- Two independent Operational Amplifiers
- External connections to all ports
- 3 MHz Gain Bandwidth Product (GBWP)

### 11.1 Control Registers

The OPA1CON register, shown in Register 11-1, controls OPA1. OPA2CON, shown in Register 11-2, controls OPA2.

### 11.2 OPAxCON Register

The OPA module is enabled by setting the OPAON bit (OPAxCON<7>). When enabled, OPAON forces the output driver of RC3/AN7/C12IN3-/OP1 for OPA1, and RC2/AN6/C12IN2-/OP2 for OPA2, into tri-state to prevent contention between the driver and the OPA output.

| Note: | When OPA1 or OPA2 is enabled, the RC3/AN7/C12IN3-/OP1 pin, or RC2/AN6/C12IN2-/OP2 pin respectively, is driven by the op amp output, not by the PORTC driver. Refer to the Electrical specifications for the op amp output drive capability. |

**Preliminary**

## 11.3 Effects of RESET

A device RESET forces all registers to their RESET state. This disables both op amps.

## 11.4 OPA Module Performance

Common AC and DC performance specifications for the OPA module:

- Common Mode Voltage Range
- Leakage Current
- Input Offset Voltage
- Open Loop Gain
- Gain Bandwidth Product (GBWP)

**Common mode voltage range** is the specified voltage range for the OPA+ and OPA- inputs, for which the OPA module will perform to within its specifications. The OPA module is designed to operate with input voltages between 0 and V<sub>DD</sub>-1.4V. Behavior for common mode voltages greater than V<sub>DD</sub>-1.4V, or below 0V, are beyond the normal operating range.

**Leakage current** is a measure of the small source or sink currents on the OPA+ and OPA- inputs. To minimize the effect of leakage currents, the effective impedances connected to the OPA+ and OPA- inputs should be kept as small as possible and equal.

**Input offset voltage** is a measure of the voltage difference between the OPA+ and OPA- inputs in a closed loop circuit with the OPA in its linear region. The offset voltage will appear as a DC offset in the output equal to the input offset voltage, multiplied by the gain of the circuit. The input offset voltage is also affected by the common mode voltage.

**Open loop gain** is the ratio of the output voltage to the differential input voltage, (OPA+) - (OPA-). The gain is greatest at DC and falls off with frequency.

**Gain Bandwidth Product** or GBWP is the frequency at which the open loop gain falls off to 0 dB.

**TABLE 11-1: REGISTERS ASSOCIATED WITH THE OPA MODULE**

**NOTES:**

**Preliminary**

## 12.0 ANALOG-TO-DIGITAL CONVERTER (A/D) MODULE

The analog-to-digital converter (A/D) allows conversion of an analog input signal to a 10-bit binary representation of that signal. The PIC16F785 has twelve analog I/O inputs, plus two internal inputs, multiplexed into one sample and hold circuit. The output of the sample and hold is connected to the input of the converter. The converter generates a binary result via successive approximation and stores the result in a 10-bit register. The voltage reference used in the conversion is software selectable to either VDD or a voltage applied by the VREF pin. Figure 12-1 shows the block diagram of the A/D on the PIC16F785.

**FIGURE 12-1:     A/D BLOCK DIAGRAM**
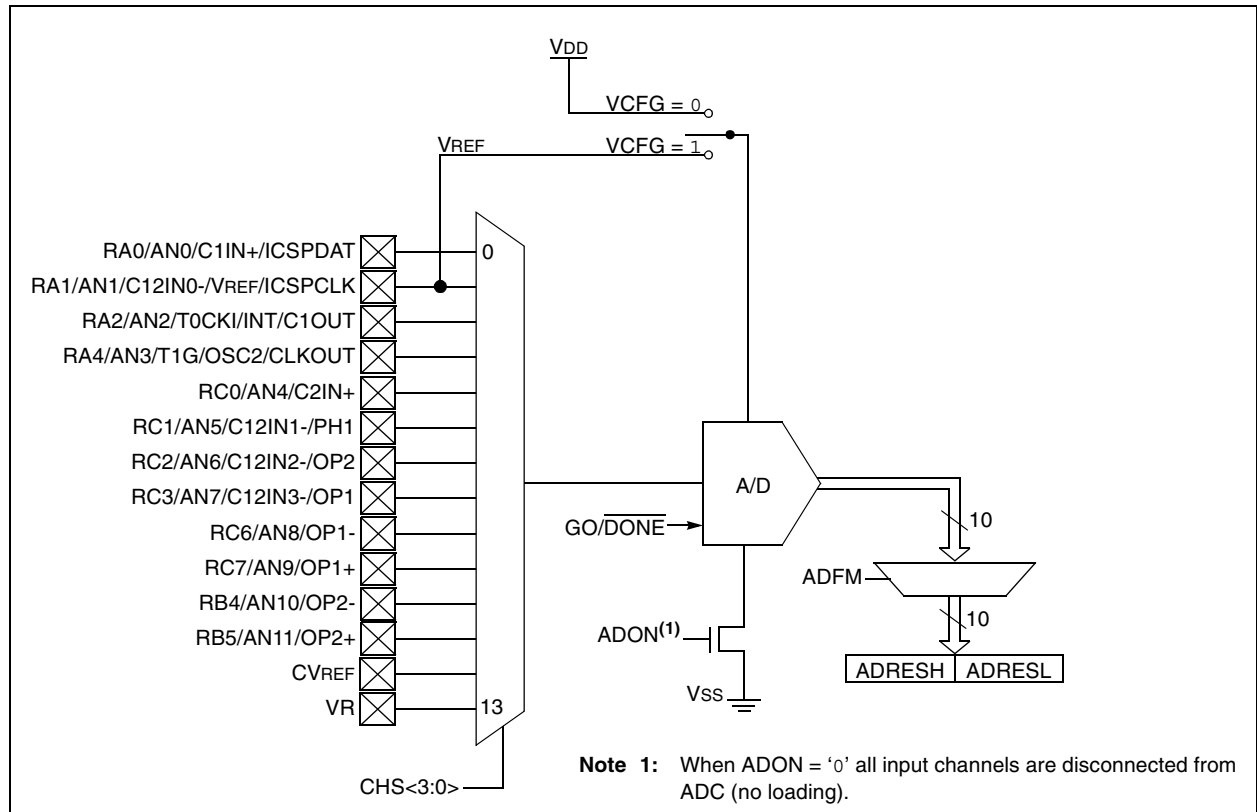

## 12.1 A/D Configuration and Operation

There are four registers available to control the functionality of the A/D module:

1. ANSEL0 (Register 12-1)
2. ANSEL1 (Register 12-2)
3. ADCON0 (Register 12-3)
4. ADCON1 (Register 12-4)

### 12.1.1 ANALOG PORT PINS

The ANS<11:0> bits (ANSEL1<3:0> and ANSEL0<7:0>) and the TRISA<4,2:0>, TRISB<5:4> and TRISC<7:6,3:0>> bits control the operation of the A/D port pins. Set the corresponding TRISx bits to '1' to set the pin output driver to its high-impedance state. Likewise, set the corresponding ANSx bit to disable the digital input buffer.

| Note: | Analog voltages on any pin that is defined as a digital input may cause the input buffer to conduct excess current. |
|---|---|

### 12.1.2 CHANNEL SELECTION

There are fourteen analog channels on the PIC16F785. The CHS<3:0> bits (ADCON0<5:2>) control which channel is connected to the sample and hold circuit.

### 12.1.3 VOLTAGE REFERENCE

There are two options for the voltage reference to the A/D converter: either VDD is used or an analog voltage applied to VREF is used. The VCFG bit (ADCON0<6>) controls the voltage reference selection. If VCFG is set, then the voltage on the VREF pin is the reference; otherwise, VDD is the reference.

### 12.1.4 CONVERSION CLOCK

The A/D conversion cycle requires 11 TAD. The source of the conversion clock is software selectable via the ADCS bits (ADCON1<6:4>). There are seven possible clock options:

- FOSC/2
- FOSC/4
- FOSC/8
- FOSC/16
- FOSC/32
- FOSC/64
- FRC (dedicated internal oscillator)

For correct conversion, the A/D conversion clock (1/TAD) must be selected to ensure a minimum TAD of 1.6 µs. Table 12-1 shows a few TAD calculations for selected frequencies.

**TABLE 12-1: TAD VS. DEVICE OPERATING FREQUENCIES**

| A/D Clock Source (TAD) | | Device Frequency | | | |
|---|---|---|---|---|---|
| Operation | ADCS2:ADCS0 | 20 MHz | 5 MHz | 4 MHz | 1.25 MHz |
| 2 TOSC | 000 | 100 ns[2] | 400 ns[2] | 500 ns[2] | 1.6 µs |
| 4 TOSC | 100 | 200 ns[2] | 800 ns[2] | 1.0 µs[2] | 3.2 µs |
| 8 TOSC | 001 | 400 ns[2] | 1.6 µs | 2.0 µs | 6.4 µs |
| 16 TOSC | 101 | 800 ns[2] | 3.2 µs | 4.0 µs | 12.8 µs[3] |
| 32 TOSC | 010 | 1.6 µs | 6.4 µs | 8.0 µs[3] | 25.6 µs[3] |
| 64 TOSC | 110 | 3.2 µs | 12.8 µs[3] | 16.0 µs[3] | 51.2 µs[3] |
| A/D RC | x11 | 2–6 µs[1,4] | 2–6 µs[1,4] | 2–6 µs[1,4] | 2–6 µs[1,4] |

**Legend:** Shaded cells are outside of recommended range.

**Note 1:** The A/D RC source has a typical TAD time of 4 µs for VDD > 3.0V.

**2:** These values violate the minimum required TAD time.

**3:** For faster conversion times, the selection of another clock source is recommended.

**4:** When the device frequency is greater than 1 MHz, the A/D RC clock source is only recommended if the conversion will be performed during Sleep.

## 12.1.5 STARTING A CONVERSION

The A/D conversion is initiated by setting the GO/DONE bit (ADCON0<1>). When the conversion is complete, the A/D module:

- Clears the GO/DONE bit
- Sets the ADIF flag (PIR1<6>)
- Generates an interrupt (if enabled)

If the conversion must be aborted, the GO/DONE bit can be cleared in software. The ADRESH:ADRESL registers will not be updated with the partially complete A/D conversion sample. Instead, the ADRESH:ADRESL registers will retain the value of the previous conversion. After an aborted conversion, a 2 T$_{AD}$ delay is required before another acquisition can be initiated. Following the delay, an input acquisition is automatically started on the selected channel.

> **Note:** The GO/DONE bit should not be set in the same instruction that turns on the A/D.

**FIGURE 12-2: A/D CONVERSION T$_{AD}$ CYCLES**

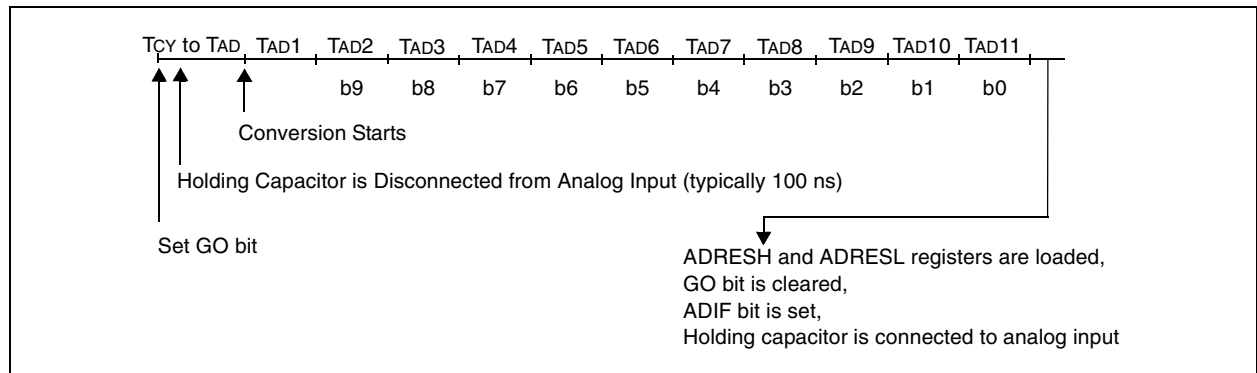

## 12.1.6 CONVERSION OUTPUT

The A/D conversion can be supplied in two formats: left or right justified. The ADFM bit (ADCON0<7>) controls the output format. Figure 12-3 shows the output formats.

**FIGURE 12-3: 10-BIT A/D RESULT FORMAT**
# PIC16F785

# PIC16F785

## 12.1.7 CONFIGURING THE A/D

After the A/D module has been configured as desired, the selected channel must be acquired before the conversion is started. The analog input channels must have their corresponding TRIS bits selected as inputs.

To determine sample time, see **Section 18.0 "Electrical Specifications"**. After this sample time has elapsed the A/D conversion can be started.

These steps should be followed for an A/D conversion:

1. Configure the A/D module:
   - Configure analog/digital I/O (ANSx)
   - Configure voltage reference (ADCON0)
   - Select A/D input channel (ADCON0)
   - Select A/D conversion clock (ADCON1)
   - Turn on A/D module (ADCON0)
2. Configure A/D interrupt (if desired):
   - Clear ADIF bit (PIR1<6>)
   - Set ADIE bit (PIE1<6>)
   - Set PEIE and GIE bits (INTCON<7:6>)
3. Wait the required acquisition time.
4. Start conversion:
   - Set GO/$\overline{\text{DONE}}$ bit (ADCON0<1>)
5. Wait for A/D conversion to complete, by either:
   - Polling for the GO/$\overline{\text{DONE}}$ bit to be cleared (with interrupts disabled); OR
   - Waiting for the A/D interrupt
6. Read A/D Result register pair (ADRESH:ADRESL), clear bit ADIF if required.
7. For next conversion, go to step 1 or step 2 as required. The A/D conversion time per bit is defined as $T_{AD}$. A minimum wait of 2 $T_{AD}$ is required before the next acquisition starts.

**Preliminary**

## 12.2 A/D Acquisition Requirements

For the A/D converter to meet its specified accuracy, the charge holding capacitor (C$_{HOLD}$) must be allowed to fully charge to the input channel voltage level. The analog input model is shown in Figure 12-4. The source impedance (R$_S$) and the internal sampling switch (R$_{SS}$) impedance directly affect the time required to charge the capacitor C$_{HOLD}$. The sampling switch (R$_{SS}$) impedance varies over the device voltage (V$_{DD}$), see Figure 12-4. **The maximum recommended impedance for analog sources is 10 k$\Omega$**. As the impedance is decreased, the acquisition time may be decreased. After the analog input channel is selected (changed), this acquisition must be done before the conversion can be started.

To calculate the minimum acquisition time, Equation 12-1 may be used. This equation assumes that 1/2 LSb error is used (1024 steps for the A/D). The 1/2 LSb error is the maximum error allowed for the A/D to meet its specified resolution.

To calculate the minimum acquisition time, T$_{ACQ}$, see the *PICmicro® Mid-Range Reference Manual* (DS33023).

**EQUATION 12-1: ACQUISITION TIME EXAMPLE**

$$T_{ACQ} = \text{Amplifier Settling Time} + \text{Hold Capacitor Charging Time} + \text{Temperature Coefficient}$$
$$= T_{AMP} + T_C + T_{COFF}$$
$$= 2\mu s + T_C + [(\text{Temperature} - 25°C)(0.05\mu s/°C)]$$

*Where C$_{HOLD}$ is charged to within 1/2 lsb:*

$$V_{APPLIED}\left(1 - \frac{1}{2047}\right) = V_{CHOLD} \qquad \text{;[1] } V_{CHOLD} \text{ charged to within 1/2 lsb}$$

$$V_{APPLIED}\left(1 - e^{\frac{-Tc}{RC}}\right) = V_{CHOLD} \qquad \text{;[2] } V_{CHOLD} \text{ charge response to } V_{APPLIED}$$

$$V_{APPLIED}\left(1 - e^{\frac{-Tc}{RC}}\right) = V_{APPLIED}\left(1 - \frac{1}{2047}\right) \qquad \text{;combining [1] and [2]}$$

*Solving for T$_C$:*

$$T_C = -C_{HOLD}(R_{IC} + R_{SS} + R_S)\ ln(1/2047)$$
$$= -10pF(1k\Omega + 7k\Omega + 10k\Omega)\ ln(0.0004885)$$
$$= 1.37\mu s$$

*Therefore:*

$$T_{ACQ} = 2\mu s + 1.37\mu s + [(50°C - 25°C)(0.05\mu s/°C)]$$
$$= 4.67\mu s$$

**Note 1:** The reference voltage (V$_{REF}$) has no effect on the equation, since it cancels itself out.

**2:** The charge holding capacitor (C$_{HOLD}$) is not discharged after each conversion.

**3:** The maximum recommended impedance for analog sources is 10 k$\Omega$. This is required to meet the pin leakage specification.

CHOLD = Sample/Hold Capacitance (from DAC)
## 12.3 A/D Operation During Sleep

The A/D converter module can operate during Sleep. This requires the A/D clock source to be set to the F$_{RC}$ option. When the RC clock source is selected, the A/D waits one instruction before starting the conversion. This allows the SLEEP instruction to be executed, thus eliminating much of the switching noise from the conversion. When the conversion is complete, the GO/$\overline{DONE}$ bit is cleared and the result is loaded into the ADRESH:ADRESL registers. If the A/D interrupt is

enabled, the device awakens from Sleep. If the GIE bit (INTCON<7>) is set, the program counter is set to the interrupt vector (0004h). If GIE is clear, the next instruction is executed. If the A/D interrupt is not enabled, the A/D module is turned off, although the ADON bit remains set.

When the A/D clock source is something other than RC, a SLEEP instruction causes the present conversion to be aborted and the A/D module is turned off. The ADON bit remains set.

**FIGURE 12-5: A/D TRANSFER FUNCTION**
## 12.4 Effects of Reset

A device Reset forces all registers to their Reset state. Thus, the A/D module is turned off and any pending conversion is aborted. The ADRESH:ADRESL registers are unchanged.

## 12.5 Use of the CCP Trigger

An A/D conversion can be started by the "special event trigger" of the CCP module. This requires that the CCP1M3:CCP1M0 bits (CCP1CON<3:0>) be programmed as '1011' and that the A/D module is enabled (ADON bit is set). When the trigger occurs, the GO/$\overline{DONE}$ bit will be set, starting the A/D conversion

and the Timer1 counter will be reset to zero. Timer1 is reset to automatically repeat the A/D acquisition period with minimal software overhead (moving the ADRESH:ADRESL to the desired location).

The appropriate analog input channel must be selected and the minimum acquisition done before the "special event trigger" sets the GO/$\overline{DONE}$ bit (starts a conversion).

If the A/D module is not enabled (ADON is cleared), then the "special event trigger" will be ignored by the A/D module, but will still reset the Timer1 counter. See **Section 8.0 "Capture/Compare/PWM (CCP) Module"** for more information.

## 13.0 TWO-PHASE PWM

The two-phase PWM (Pulse Width Modulator) is a stand-alone peripheral that supports:
- Single or dual-phase PWM
- Single complementary output PWM with overlap/delay
- Sync input/output to cascade devices for additional phases

Setting either, or both, of the PH1EN or PH2EN bits of the PWMCON0 register will activate the PWM module (see Register 13-1). If PH1 is used then TRISC<1> must be cleared to configure the pin as an output. The same is true for TRISC<4> when using PH2.

### 13.1 PWM Period

The PWM period is derived from the main clock (FOSC), the PWM prescaler and the period counter (see Figure 13-3). The prescale bits (PWMP<1:0>, see Register 13-2) determine the value of the clock divider which divides the system clock (FOSC) to the pwm_clk. This pwm_clk is used to drive the PWM counter. In Master mode, the PWM counter is reset when the count reaches the period count (PER<4:0>, see Register 13-2), which determines the frequency of the PWM. The relationship between the PWM frequency, prescale and period count is shown in Equation 13-1.

**EQUATION 13-1: PWM FREQUENCY**

$$PWM_{FREQ} = \frac{Fosc}{(2^{PWMP} \cdot (PER + 1))}$$

The maximum PWM frequency is FOSC/2, since the period count must be greater than zero.

In Slave mode, the period counter is reset by the SYNC input, which is the master device period counter reset. For proper operation, the slave period count should be equal to or greater than that of the master.

### 13.2 PWM Phase

Each enabled phase output is driven active when the phase counter matches the corresponding PWM phase count (PH<4:0>, see Register 13-4 and Register 13-5). The phase output remains true until terminated by a feedback signal from either of the comparators or the auto shutdown activates.

Phase granularity is a function of the period count value. For example, if PER<4:0> = 3, each output can be shifted in 90° steps (see Equation 13-2).

**EQUATION 13-2: PHASE RESOLUTION**

$$Phase_{DEG} = \frac{360}{(PER + 1)}$$

### 13.3 PWM Duty Cycle

Each PWM output is driven inactive, terminating the drive period, by asynchronous feedback through the internal comparators. The duty cycle resolution is in effect infinitely adjustable. Either or both comparators can be used to reset the PWM by setting the corresponding comparator enable bit (CxEN, see Register 13-3). Duty cycles of 100% can be obtained by suppressing the feedback which would otherwise terminate the pulse.

The comparator outputs can be "held off", or blanked, by enabling the corresponding BLANK bit (BLANKx, see Register 13-1) for each phase. The blank bit disables the comparator outputs for 1/2 of a system clock (FOSC), thus ensuring at least Tosc/2 active time for the PWM output. Blanking avoids early termination of the PWM output which may result due to switching transients at the beginning of the cycle.

### 13.4 Master/Slave Operation

Multiple chips can operate together to achieve additional phases by operating one as the master and the others as slaves. When the PWM is configured as a master, the RB7/SYNC pin is an output and generates a high output for one pwm_clk period at the end of each PWM period (see Figure 13-4).

When the PWM is configured as a slave, the RB7/SYNC pin is an input. The high input from a master in this configuration resets the PWM period counter which synchronizes the slave unit at the end of each PWM period. Proper operation of a slave device requires a common external FOSC clock source to drive the master and slave. The PWM prescale value of the slave device must also be identical to that of the master. As mentioned previously, the slave period count value must be greater than or equal to that of the master.

The PWM Counter will be reset and held at zero when both PH1EN and PH2EN (PWMCON0<1:0>) are false. If the PWM is configured as a slave, the PWM Counter will remain reset at zero until the first SYNC input is received.

# PIC16F785

## 13.5 Active PWM Output Level

The PWM output signal can be made active high or low by setting or resetting the corresponding POL bit (see Register 13-3 and Register 13-4). When POL is '1' the active output state is V$_{OL}$.  When POL is '0' the active output state is V$_{OH}$.

## 13.6 Auto-Shutdown and Auto-Restart

When the PWM is enabled, the PWM outputs may be configured for auto-shutdown by setting the PASEN bit (see Register 13-1). V$_{IL}$ on the RA2/AN2/T0CKI/INT/C1OUT pin will cause a shutdown event if auto-shutdown is enabled. An Auto-shutdown event immediately places the PWM outputs in the inactive state (see **Section 13.5 "Active PWM Output Level"**) and the PWM phase and period counters are reset and held to zero.

The PWMASE bit (see Register 13-2) is set by hardware when a shutdown event occurs. If automatic restarts are not enabled (PRSEN = 0, see Register 13-1), PWM operation will not resume until the PWMASE bit is cleared by firmware after the shutdown condition clears. The PWMASE bit can not be cleared as long as the shutdown condition exists. If automatic restarts are not enabled, the auto-shutdown mode can be forced by writing a '1' to the PWMASE bit.

If automatic restarts are enabled (PRSEN = 1), the PWMASE bit is automatically cleared and PWM operation resumes when the auto-shutdown event clears (V$_{IH}$ on the RA2/AN2/T0CKI/INT/C1OUT pin).

**FIGURE 13-3: 2 PHASE PWM SIMPLIFIED BLOCK DIAGRAM**

## 13.7 Example single phase application

Figure 13-7 shows an example of a single phase buck voltage regulator application. The PWM output drives Q1 with pulses to alternately charge and discharge L1. C4 holds the charge from L1 during the inactive cycle of the drive period. R4 and C3 form a ramp generator. At the beginning of the PWM period, the PWM output goes high causing the voltage on C3 to rise concurrently with the current in L1. When the voltage across C3 reaches the threshold level present at the positive input of comparator 1, the comparator output changes and terminates the drive output from the PWM to Q1. When Q1 is not driven, the current path to L1 through Q1 is interrupted, but since the current in L1 cannot stop instantly, the current continues to flow through D2 as L1 discharges into C4. D1 quickly discharges C3 in preparation of the next ramp cycle.

Resistor divider R5 and R6 scale the output voltage, which is inverted and amplified by Op Amp 1 relative to the reference voltage present at the non-inverting pin of the op amp. R3, C5 and C2 form the inverting stabilization gain feedback of the amplifier. The VR reference supplies a stable reference to the non-inverting input of the op amp, which is tweaked by the voltage source created by a secondary time based PWM output of the CCP and R1 and C1.

Output regulation occurs by the following principle: If the regulator output voltage is too low, then the voltage to the non-inverting input of comparator 1 will rise, resulting in a higher threshold voltage and consequently longer PWM drive pulses into Q1. If the output voltage is too high, then the voltage to the non-inverting input of comparator 1 will fall, resulting in shorter PWM drive pulses into Q1.

**FIGURE 13-7: EXAMPLE SINGLE PHASE APPLICATION**

**Preliminary**
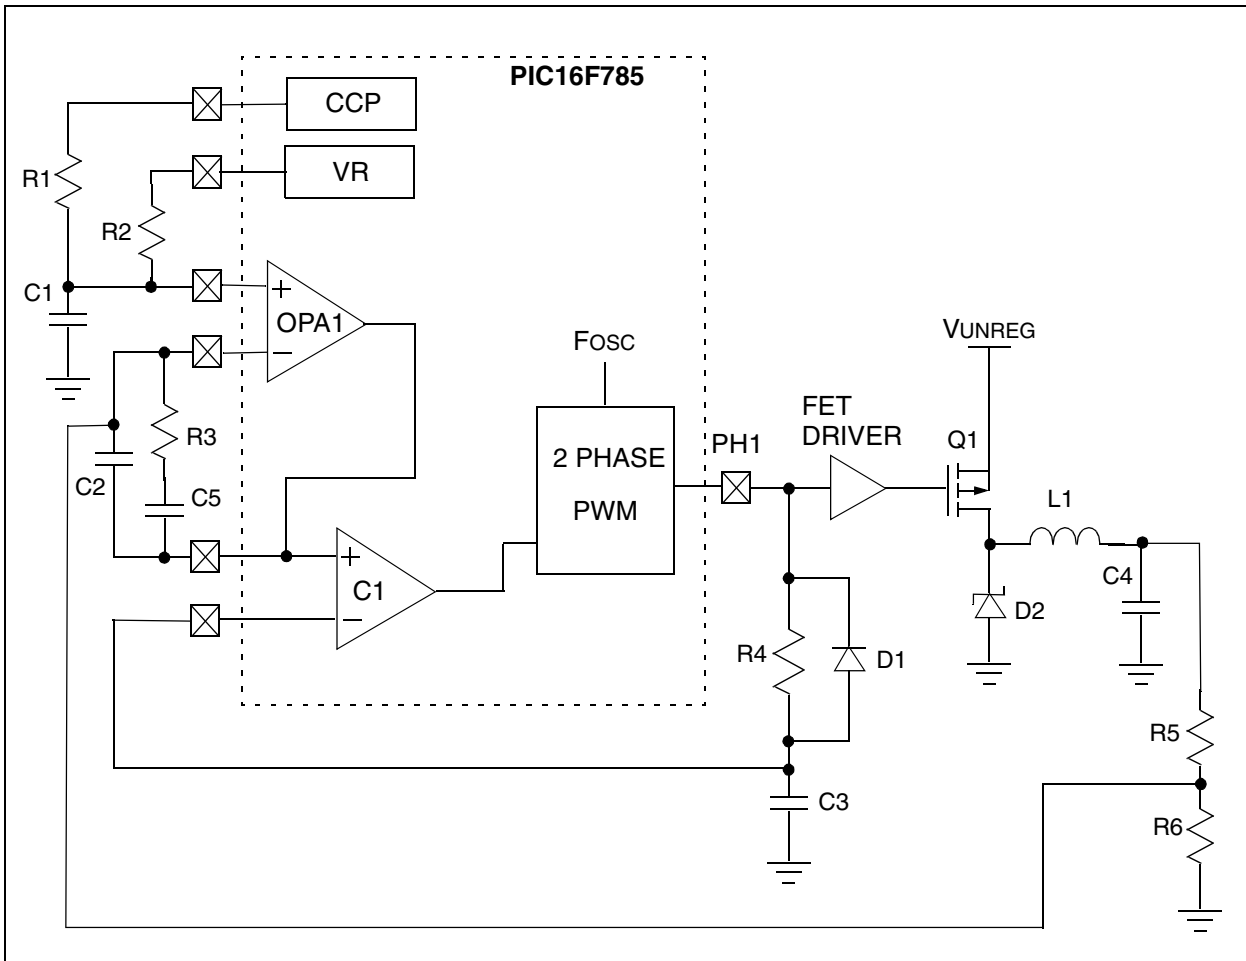

## 13.8 Complementary Output Mode

The 2 Phase PWM module may be configured to operate in a Complementary Output mode where PH1 and PH2 are always 180 degrees out-of-phase (see Figure 13-8). Three complementary modes are available and are selected by the COMOD<1:0> bits in the PWMCON1 register (see Register 13-5). The difference between the modes is the method by which the PH1 and PH2 outputs switch from the active to the inactive state during the PWM period.

The Complementary Output mode facilitates driving series connected MOSFET drivers by providing overlap or deadband drive timing between each phase output (see Figure 13-9). Overlap or deadband times are selectable by the CMDLY<4:0> bits of the PWMCON1 register. Delays from 0 to 155 nanoseconds (typical) with a resolution of 5 nanoseconds (typical) are available.

Selection between overlap or deadband delay is controlled by the OVRLP bit of the PWM control register (PWMCON1<7>).

## 14.0 DATA EEPROM MEMORY

The EEPROM data memory is readable and writable during normal operation (full VDD range). This memory is not directly mapped in the register file space. Instead, it is indirectly addressed through the Special Function Registers. There are four SFRs used to read and write this memory:

- EECON1
- EECON2 (not a physically implemented register)
- EEDAT
- EEADR

EEDAT holds the 8-bit data for read/write, and EEADR holds the address of the EEPROM location being accessed. The PIC16F785 has 256 bytes of data EEPROM with an address range from 0h to FFh.

The EEPROM data memory allows byte read and write. A byte write automatically erases the location and writes the new data (erase before write). The EEPROM data memory is rated for high erase/write cycles. The write time is controlled by an on-chip timer. The write time will vary with voltage and temperature, as well as from chip-to-chip. Please refer to AC Specifications in **Section 18.0 "Electrical Specifications"** for exact limits.

When the data memory is code-protected, the CPU may continue to read and write the data EEPROM memory. The device programmer can no longer access the data EEPROM data and will read zeroes.

Additional information on the data EEPROM is available in the *PICmicro® Mid-Range Reference Manual,* (DS33023).

## 14.1 EECON1 AND EECON2 REGISTERS

EECON1 is the control register with four low-order bits physically implemented. The upper four bits are non-implemented and read as '0's.

Control bits RD and WR initiate read and write, respectively. These bits cannot be cleared, only set in software. They are cleared in hardware at completion of the read or write operation. The inability to clear the WR bit in software prevents the accidental, premature termination of a write operation.

The WREN bit, when set, will allow a write operation. On power-up, the WREN bit is clear. The WRERR bit is set when a write operation is interrupted by a $\overline{\text{MCLR}}$ Reset, or a WDT Time-out Reset during normal operation. In these situations, following Reset, the user can check the WRERR bit, clear it and rewrite the location. The EEDAT and EEADR registers are cleared by a reset. Therefore, the EEDAT and EEADR registers will need to be re-initialized.

Interrupt flag EEIF bit (PIR1<7>) is set when write is complete. This bit must be cleared in software.

EECON2 is not a physical register. Reading EECON2 will read all '0's. The EECON2 register is used exclusively in the data EEPROM write sequence.

> **Note:** The EECON1, EEDAT and EEADR registers should not be modified during a data EEPROM write (WR bit = '1').

bit 7                                                    bit 0

bit 7-4    **Unimplemented:** Read as '0'

bit 3       **WRERR:** EEPROM Error Flag bit

             1 = A write operation is prematurely terminated (any $\overline{\text{MCLR}}$ Reset, any WDT Reset during normal operation or BOR reset)
             0 = The write operation completed

bit 2       **WREN:** EEPROM Write Enable bit

             1 = Allows write cycles
             0 = Inhibits write to the data EEPROM

bit 1       **WR:** Write Control bit

             1 = Initiates a write cycle (The bit is cleared by hardware once write is complete. The WR bit can only be set, not cleared, in software.)
             0 = Write cycle to the data EEPROM is complete

bit 0       **RD:** Read Control bit

             1 = Initiates an EEPROM read (Read takes one cycle. RD is cleared in hardware. The RD bit can only be set, not cleared, in software.)
             0 = Does not initiate an EEPROM read

| Legend: | | |
|---------|---|---|
| S = Bit can only be set | | |
| R = Readable bit | W = Writable bit | U = Unimplemented bit, read as '0' |
| - n = Value at POR | '1' = Bit is set | '0' = Bit is cleared     x = Bit is unknown |

## 14.2 READING THE EEPROM DATA MEMORY

To read a data memory location, the user must write the address to the EEADR register and then set control bit RD (EECON1<0>), as shown in Example 14-1. The data is available, in the very next cycle, in the EEDAT register. Therefore, it can be read in the next instruction. EEDAT holds this value until another read, or until it is written to by the user (during a write operation).

### EXAMPLE 14-1: DATA EEPROM READ

```
    BSF        STATUS,RP0 ;Bank 1
    BSF        STATUS,RP1
    MOVLW      CONFIG_ADDR;
    MOVWF      EEADR      ;Address to read
    BSF        EECON1,RD  ;EE Read
    MOVF       EEDAT,W    ;Move data to W
```

## 14.3 WRITING TO THE EEPROM DATA MEMORY

To write an EEPROM data location, the user must first write the address to the EEADR register and the data to the EEDAT register. Then the user must follow a specific sequence to initiate the write for each byte, as shown in Example 14-2.

### EXAMPLE 14-2: DATA EEPROM WRITE

```
    BSF        STATUS,RP0  ;Bank 1
    BSF        STATUS,RP1
    BSF        EECON1,WREN ;Enable write
    BCF        INTCON,GIE  ;Disable INTs
    MOVLW      55h         ;Unlock write
    MOVWF      EECON2      ;
    MOVLW      AAh         ;
    MOVWF      EECON2      ;
    BSF        EECON1,WR   ;Start the write
    BSF        INTCON,GIE  ;Enable INTs
```
(Required Sequence brackets MOVLW 55h through BSF EECON1,WR)

The write will not initiate if the above sequence is not followed exactly (write 55h to EECON2, write AAh to EECON2, then set WR bit) for each byte. We strongly recommend that interrupts be disabled during this code segment. A cycle count is executed during the required sequence. Any number that is not equal to the required cycles to execute the required sequence will prevent the data from being written into the EEPROM.

Additionally, the WREN bit in EECON1 must be set to enable write. This mechanism prevents accidental writes to data EEPROM due to errant (unexpected) code execution (i.e., lost programs). The user should keep the WREN bit clear at all times, except when updating the EEPROM. The WREN bit is not cleared by hardware.

After a write sequence has been initiated, clearing the WREN bit will not affect this write cycle. The WR bit will be inhibited from being set unless the WREN bit is set.

At the completion of the write cycle, the WR bit is cleared in hardware and the EE Write Complete Interrupt Flag bit (EEIF) is set. The user can either enable this interrupt or poll this bit. The EEIF bit (PIR1<7>) register must be cleared by software.

## 14.4 WRITE VERIFY

Depending on the application, good programming practice may dictate that the value written to the data EEPROM should be verified (see Example 14-3) to the desired value to be written.

### EXAMPLE 14-3: WRITE VERIFY

```
    BSF        STATUS,RP0 ;Bank 1
    BSF        STATUS,RP1
    MOVF       EEDAT,W    ;EEDAT not changed
                         ; from previous write
    BSF        EECON1,RD  ;YES, Read the
                         ; value written
    XORWF      EEDAT,W
    BTFSS      STATUS,Z   ;Is data the same
    GOTO       WRITE_ERR  ;No, handle error
                         ;Yes, continue
```

### 14.4.1 USING THE DATA EEPROM

The data EEPROM is a high-endurance, byte address-able array that has been optimized for the storage of frequently changing information (e.g., program variables or other data that are updated often). When variables in one section change frequently, while variables in another section do not change, it is possible to exceed the total number of write cycles to the EEPROM (specification D124) without excceding the total number of write cycles to a single byte (specifications D120 and D120A). If this is the case, then an array refresh must be performed. For this reason, variables that change infrequently (such as constants, IDs, calibration, etc.) should be stored in Flash program memory.

## 14.5 PROTECTION AGAINST SPURIOUS WRITE

There are conditions when the user may not want to write to the data EEPROM memory. To protect against spurious EEPROM writes, various mechanisms have been built in. On power-up, WREN is cleared. Also, the Power-up Timer (64 ms duration) prevents EEPROM write.

The write initiate sequence and the WREN bit together help prevent an accidental write during:

- brown-out
- power glitch
- software malfunction

## 14.6 DATA EEPROM OPERATION DURING CODE-PROTECT

Data memory can be code-protected by programming the CPD bit in the Configuration Word (Register 15-1) to '0'.

When the data memory is code-protected, the CPU is able to read and write data to the data EEPROM. It is recommended to code-protect the program memory when code-protecting data memory. This prevents anyone from programming zeroes over the existing code (which will execute as NOPs) to reach an added routine, programmed in unused program memory, which outputs the contents of data memory. Programming unused locations in program memory to '0' will also help prevent data memory code protection from becoming breached.

### TABLE 14-1: REGISTERS/BITS ASSOCIATED WITH DATA EEPROM

| Address | Name | Bit 7 | Bit 6 | Bit 5 | Bit 4 | Bit 3 | Bit 2 | Bit 1 | Bit 0 | Value on: POR, BOR | Value on all other Resets |
|---------|------|-------|-------|-------|-------|-------|-------|-------|-------|--------------------|---------------------------|
| 0Bh, 8Bh | INTCON | GIE | PEIE | T0IE | INTE | RAIE | T0IF | INTF | RAIF | 0000 0000 | 0000 0000 |
| 0Ch | PIR1 | EEIF | ADIF | CCP1IF | C2IF | C1IF | OSFIF | TMR2IF | TMR1IF | 0000 0000 | 0000 0000 |
| 8Ch | PIE1 | EEIE | ADIE | CCP1IE | C2IE | C1IE | OSFIE | TMR2IE | TMR1IE | 0000 0000 | 0000 0000 |
| 9Ah | EEDAT | EEDAT7 | EEDAT6 | EEDAT5 | EEDAT4 | EEDAT3 | EEDAT2 | EEDAT1 | EEDAT0 | 0000 0000 | 0000 0000 |
| 9Bh | EEADR | EEADR7 | EEADR6 | EEADR5 | EEADR4 | EEADR3 | EEADR2 | EEADR1 | EEADR0 | 0000 0000 | 0000 0000 |
| 9Ch | EECON1 | — | — | — | — | WRERR | WREN | WR | RD | ---- x000 | ---- q000 |
| 9Dh | EECON2 | EEPROM Control register 2 (not a physical register) | | | | | | | | ---- ---- | ---- ---- |

**Legend:** x = unknown, u = unchanged, — = unimplemented read as '0', q = value depends upon condition.
Shaded cells are not used by data EEPROM module.

## 15.0 SPECIAL FEATURES OF THE CPU

The PIC16F785 has a host of features intended to maximize system reliability, minimize cost through elimination of external components, provide power saving features and offer code protection.

These features are:

- Reset
  - Power-on Reset (POR)
  - Power-up Timer (PWRT)
  - Oscillator Start-up Timer (OST)
  - Brown-out Reset (BOR)
- Interrupts
- Watchdog Timer (WDT)
- Oscillator selection
- Sleep
- Code protection
- ID Locations
- In-Circuit Serial Programming™ (ISCP™)

The PIC16F785 has two timers that offer necessary delays on power-up. One is the Oscillator Start-up Timer (OST), intended to keep the chip in Reset until the crystal oscillator is stable. The other is the Power-up Timer (PWRT), which provides a fixed delay of 64 ms (nominal) on power-up only, designed to keep the part in Reset while the power supply stabilizes. There is also circuitry to reset the device if a brown-out occurs, which can use the Power-up Timer to provide at least a 64 ms Reset. With these three functions on-chip, most applications need no external Reset circuitry.

The Sleep mode is designed to offer a very low current Power-down mode. The user can wake-up from Sleep through:

- External Reset
- Watchdog Timer Wake-up
- An interrupt

Several oscillator options are also made available to allow the part to fit the application. The INTOSC option saves system cost, while the LP crystal option saves power. A set of configuration bits are used to select various options (see Register 15-1).

## 15.1 Configuration Bits

The configuration bits can be programmed (read as '0'), or left unprogrammed (read as '1') to select various device configurations as shown in Register 15-1. These bits are mapped in program memory location 2007h.

| Note: | Address 2007h is beyond the user program memory space. It belongs to the special configuration memory space (2000h – 3FFFh), which can be accessed only during programming. See *PIC16F785 Memory Programming Specification* (DS41237) for more information. |
|---|---|

## 15.2 Calibration Bits

The Brown-out Reset (BOR), Power-on Reset (POR), 8 MHz internal oscillator (HFINTOSC), Bandgap Offset (BGOFF) and Bandgap Temperature Compensation (BGTMP) are factory calibrated and should not be altered. These calibration values are stored in five calibration words which are mapped in program memory locations 2008h and 2009h respectively.

The calibration words are not erased when the device is erased when using the procedure described in the PIC16F785 *Memory Programming Specification* (DS41237). Therefore, it is not necessary to store and reprogram these values when the device is erased.

| Note: | Addresses 2008h and 2009h are beyond the user program memory space. They belong to the special configuration memory space (2000h – 3FFFh), which can be accessed only during programming. See PIC16F785 *Memory Programming Specification* (DS41237) for more information. |
|---|---|

# PIC16F785

## REGISTER 15-1: CONFIG — CONFIGURATION WORD (ADDRESS: 2007h)

| — | — | FCMEN | IESO | BOREN1 | BOREN0 | $\overline{\text{CPD}}$ | $\overline{\text{CP}}$ | MCLRE | $\overline{\text{PWRTE}}$ | WDTE | FOSC2 | FOSC1 | FOSC0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|

bit 13                      bit 0

bit 13-12    **Unimplemented**: Read as '1'

bit 11       **FCMEN:** Fail Clock Monitor Enabled bit
                 1 = Fail-Safe Clock Monitor is enabled
                 0 = Fail-Safe Clock Monitor is disabled

bit 10       **IESO:** Internal External Switchover bit
                 1 = Internal External Switchover mode is enabled
                 0 = Internal External Switchover mode is disabled

bit 9-8     **BOREN<1:0>:** Brown-out Reset Selection bits[1]
                 11 = BOR enabled
                 10 = BOR enabled during operation and disabled in Sleep
                 01 = BOR controlled by SBOREN bit (PCON<4>)
                 00 = BOR disabled

bit 7        **$\overline{\text{CPD}}$:** Data Code Protection bit[2,3]
                 1 = Data memory code protection is disabled
                 0 = Data memory code protection is enabled

bit 6        **$\overline{\text{CP}}$:** Code Protection bit[2]
                 1 = Program memory code protection is disabled
                 0 = Program memory code protection is enabled

bit 5        **MCLRE:** RA3/$\overline{\text{MCLR}}$ pin function select bit[4]
                 1 = RA3/$\overline{\text{MCLR}}$ pin function is $\overline{\text{MCLR}}$
                 0 = RA3/$\overline{\text{MCLR}}$ pin function is digital input, $\overline{\text{MCLR}}$ internally tied to V<sub>DD</sub>

bit 4        **$\overline{\text{PWRTE}}$:** Power-up Timer Enable bit
                 1 = PWRT disabled
                 0 = PWRT enabled

bit 3        **WDTE:** Watchdog Timer Enable bit
                 1 = WDT enabled
                 0 = WDT disabled and can be enabled by SWDTEN bit (WDTCON<0>)

bit 2-0     **FOSC<2:0>:** Oscillator Selection bits
                 111 = RC oscillator: CLKOUT function on RA4/AN3/T1G/OSC2/CLKOUT pin, RC on RA5/T1CKI/OSC1/CLKIN
                 110 = RCIO oscillator: I/O function on RA4/AN3/T1G/OSC2/CLKOUT pin, RC on RA5/T1CKI/OSC1/CLKIN
                 101 = INTOSC oscillator: CLKOUT function on RA4/AN3/T1G/OSC2/CLKOUT pin, I/O function on
                      RA5/T1CKI/OSC1/CLKIN
                 100 = INTOSCIO oscillator: I/O function on RA4/AN3/T1G/OSC2/CLKOUT pin, I/O function on
                      RA5/T1CKI/OSC1/CLKIN
                 011 = EC: I/O function on RA4/AN3/T1G/OSC2/CLKOUT pin, CLKIN on RA5/T1CKI/OSC1/CLKIN
                 010 = HS oscillator: High speed crystal/resonator on RA4/AN3/T1G/OSC2/CLKOUT and RA5/T1CKI/OSC1/CLKIN
                 001 = XT oscillator: Crystal/resonator on RA4/AN3/T1G/OSC2/CLKOUT and RA5/T1CKI/OSC1/CLKIN
                 000 = LP oscillator: Low power crystal on RA4/AN3/T1G/OSC2/CLKOUT and RA5/T1CKI/OSC1/CLKIN

**Note 1:** Enabling Brown-out Reset does not automatically enable Power-up Timer.
       **2:** Program memory bulk erase must be performed to turned off code protection.
       **3:** The entire data EEPROM will be erased when the code protection is turned off.
       **4:** When $\overline{\text{MCLR}}$ is asserted in INTOSC or RC mode, the internal clock oscillator is disabled.

### 15.3 Reset

The PIC16F785 differentiates between various kinds of Reset:

a) Power-on Reset (POR)
b) WDT Reset during normal operation
c) WDT Reset during Sleep
d) MCLR Reset during normal operation
e) MCLR Reset during Sleep
f) Brown-out Reset (BOR)

Some registers are not affected in any Reset condition; their status is unknown on POR and unchanged in any other Reset. Most other registers are reset to a "Reset state" on:

• Power-on Reset
• MCLR Reset
• MCLR Reset during Sleep
• WDT Reset
• Brown-out Reset (BOR)

They are not affected by a WDT wake-up since this is viewed as the resumption of normal operation. TO and PD bits are set or cleared differently in different Reset situations, as indicated in Table 15-2. These bits are used in software to determine the nature of the Reset. See Table 15-4 for a full description of Reset states of all registers.

A simplified block diagram of the On-Chip Reset Circuit is shown in Figure 15-1.

The MCLR Reset path has a noise filter to detect and ignore small pulses. See **Section 18.0 "Electrical Specifications"** for pulse width specifications.

**FIGURE 15-1:** **SIMPLIFIED BLOCK DIAGRAM OF ON-CHIP RESET CIRCUIT**

**Note 1:** Refer to the Configuration Word register (Register 15-1).
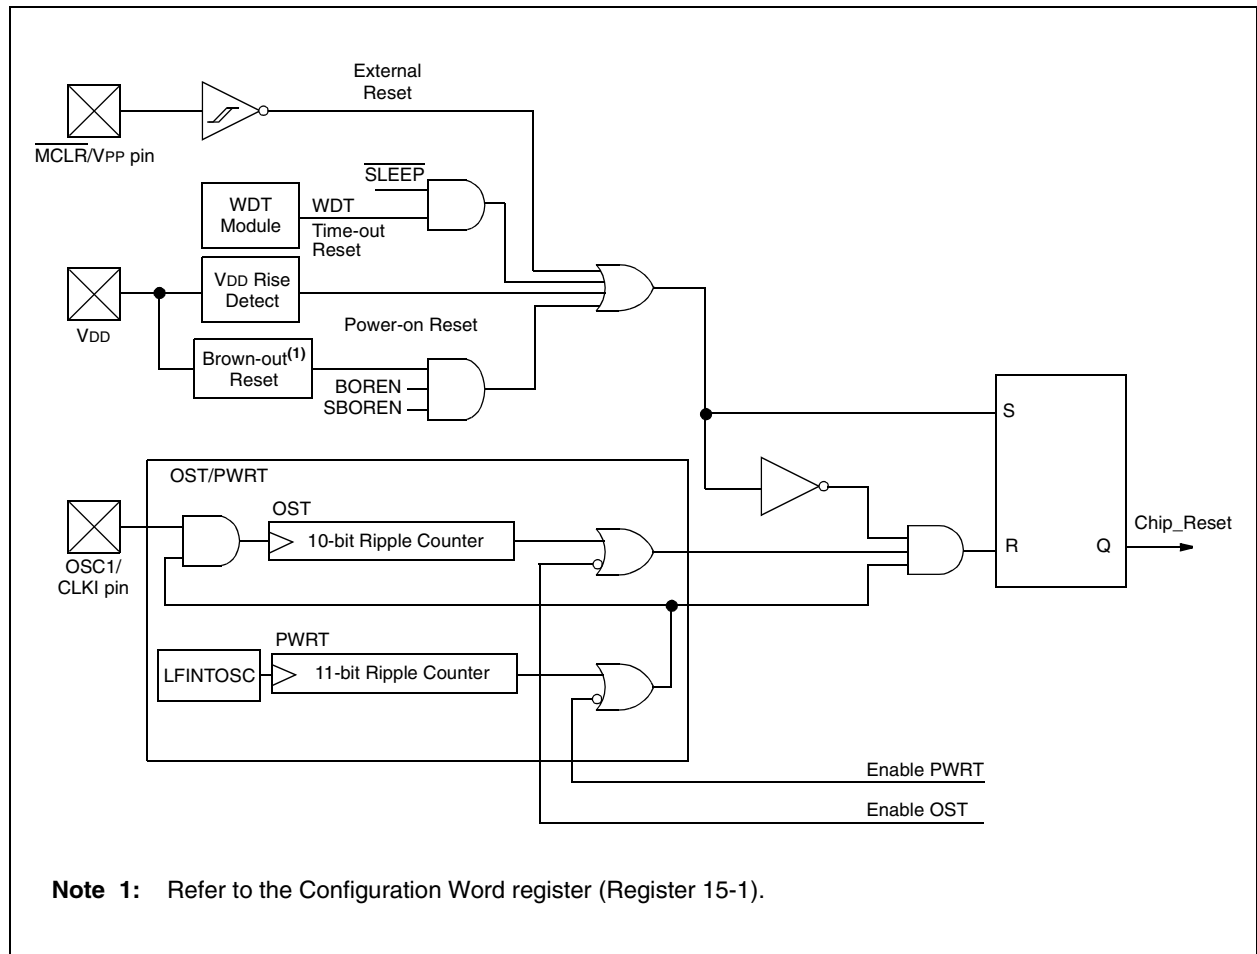

# PIC16F785

## 15.3.1 POWER-ON RESET

The on-chip POR circuit holds the chip in Reset until VDD has reached a high enough level for proper operation. To take advantage of the POR, simply connect the MCLR pin through a resistor to VDD. This will eliminate external RC components usually needed to create Power-on Reset. A minimum rise time for VDD is required. See **Section 18.0 "Electrical Specifications"** for details. If the BOR is enabled, the minimum rise time specification does not apply. The BOR circuitry will keep the device in Reset until VDD reaches VBOR (see **Section 15.3.4 "Brown-Out Reset (BOR)"**)

The POR circuit on this device has a POR re-arm circuit. This circuit is designed to ensure a re-arm of the POR circuit if VDD drops below a preset re-arming voltage (VPARM) for at least the minimum required time. Once VDD has been below the re-arming point for the minimum required time, the POR reset will reactivate and remain in reset until VDD returns to a value greater than VPOR. At this point, a 1μs (typical) delay will be initiated to allow VDD to continue to ramp to a voltage safely above VPOR.

When the device starts normal operation (exits the Reset condition), device operating parameters (i.e., voltage, frequency, temperature, etc.) must be met to ensure operation. If these conditions are not met, the device must be held in Reset until the operating conditions are met.

For additional information, refer to the *"Power-up Trouble Shooting" Application Note* (DS00607).

## 15.3.2 MASTER CLEAR (MCLR)

PIC16F785 has a noise filter in the MCLR Reset path. The filter will detect and ignore small pulses.

It should be noted that a WDT Reset does not drive MCLR pin low.

The behavior of the ESD protection on the MCLR pin has been altered from early devices of this family. Voltages applied to the pin that exceed its specification can result in both MCLR Resets and excessive current beyond the device specification during the ESD event. For this reason, Microchip recommends that the MCLR pin no longer be tied directly to VDD. The use of an RC network, as shown in Figure 15-2, is suggested.

An internal MCLR option is enabled by clearing the MCLRE bit in the Configuration Word. When cleared, MCLR is internally tied to VDD and an internal Weak Pull-up is enabled for the MCLR pin. In-Circuit Serial Programming is not affected by selecting the internal MCLR option.

**FIGURE 15-2:** **RECOMMENDED MCLR CIRCUIT**

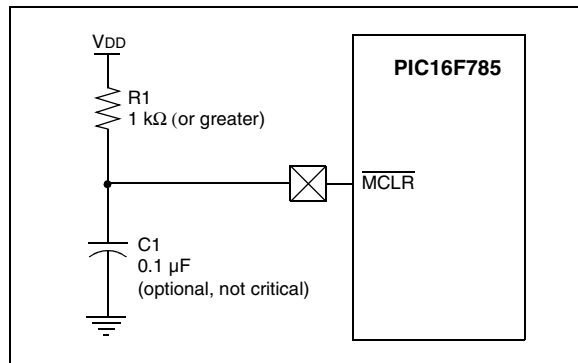

## 15.3.3 POWER-UP TIMER (PWRT)

The Power-up Timer provides a fixed 64 ms (nominal) time out on power-up only, from POR or Brown-out Reset. The Power-up Timer operates from the 31 kHz LFINTOSC oscillator. For more information, see **Section 3.4 "Internal Clock Modes"**. The chip is kept in Reset as long as PWRT is active. The PWRT delay allows the VDD to rise to an acceptable level. A configuration bit, PWRTE can disable (if '1') or enable (if '0') the Power-up Timer. The Power-up Timer should be enabled when Brown-out Reset is enabled, although it is not required.

The Power-up Time delay will vary from chip-to-chip and vary due to:

• VDD variation
• Temperature variation
• Process variation

See DC parameters for details (**Section 18.0 "Electrical Specifications"**).

## 15.3.4    BROWN-OUT RESET (BOR)

The BOREN0 and BOREN1 bits in the Configuration Word select one of four BOR modes. Two modes have been added to allow software or hardware control of the BOR enable. When BOREN<1:0> = 01, the SBOREN bit (PCON<4>) enables/disables the BOR allowing it to be controlled in software. By selecting BOREN<1:0>, the BOR is automatically disabled in Sleep to conserve power and enabled on wake-up. In this mode, the SBOREN bit is disabled. See Register 15-1 for the Configuration Word definition.

If VDD falls below VBOR for greater than parameter (TBOR), see **Section 18.0 "Electrical Specifications"**, the Brown-out situation will reset the device. This will occur regardless of VDD slew rate. A Reset is not assured if VDD falls below VBOR for less than parameter (TBOR).

On any Reset (Power-on, Brown-out Reset, Watchdog, etc.), the chip will remain in Reset until VDD rises above VBOR (see Figure 15-3). The Power-up Timer will now be invoked, if enabled, and will keep the chip in Reset an additional 64 ms.

| Note: | The Power-up Timer is enabled by the PWRTE bit in the Configuration Word. |
|---|---|

If VDD drops below VBOR while the Power-up Timer is running, the chip will go back into a Brown-out Reset and the Power-up Timer will be re-initialized. Once VDD rises above VBOR, the Power-up Timer will execute a 64 ms Reset.

## 15.3.5    BOR CALIBRATION

The PIC16F785 stores the BOR calibration values in fuses located in the Calibration Word (2008h). The Calibration Word is not erased when using the specified bulk erase sequence in the *PIC16F785 Memory Programming Specification* (DS41237) and thus, does not require reprogramming.

| Note: | Address 2008h is beyond the user program memory space. It belongs to the special configuration memory space (2000h – 3FFFh), which can be accessed only during programming. See *PIC16F785 Memory Programming Specification* (DS41237) for more information. |
|---|---|

**FIGURE 15-3:        BROWN-OUT SITUATIONS**

**Note 1:**    64 ms delay only if PWRTE bit is programmed to '0'.

---
## 15.3.6 TIME-OUT SEQUENCE

On power-up, the time-out sequence is as follows: first, PWRT time out is invoked after POR has expired, then OST is activated after the PWRT time out has expired. The total time out will vary based on oscillator configuration and $\overline{PWRTE}$ bit status. For example, in EC mode with $\overline{PWRTE}$ bit equal to '1' (PWRT disabled), there will be no time out at all. Figure 15-4, Figure 15-5 and Figure 15-6 depict time-out sequences. The device can execute code from the INTOSC, while OST is active by enabling Two-Speed Start-up or Fail-Safe Monitor (See **Section 3.6.2 "Two-Speed Start-up Sequence"** and **Section 3.7 "Fail-Safe Clock Monitor"**).

Since the time outs occur from the POR pulse, if $\overline{MCLR}$ is kept low long enough, the time outs will expire. Then bringing $\overline{MCLR}$ high will begin execution immediately (see Figure 15-5). This is useful for testing purposes or to synchronize more than one PIC16F785 device operating in parallel.

Table 15-5 shows the Reset conditions for some special registers, while Table 15-4 shows the Reset conditions for all the registers.

## 15.3.7 POWER CONTROL (PCON) REGISTER

The Power Control register PCON (address 8Eh) has two Status bits to indicate what type of Reset that last occurred.

Bit 0 is $\overline{BOR}$ (Brown-out Reset). $\overline{BOR}$ is unknown on Power-on Reset. It must then be set by the user and checked on subsequent Resets to see if $\overline{BOR} = 0$, indicating that a Brown-out has occurred. The $\overline{BOR}$ Status bit is a "don't care" and is not necessarily predictable if the brown-out circuit is disabled (BOREN<1:0> = 00 in the Configuration Word).

Bit 1 is $\overline{POR}$ (Power-on Reset). It is a '0' on Power-on Reset and unaffected otherwise. The user must write a '1' to this bit following a Power-on Reset. On a subsequent Reset, if $\overline{POR}$ is '0', it will indicate that a Power-on Reset has occurred (i.e., VDD may have gone too low).

For more information, see **Section 15.3.4 "Brown-Out Reset (BOR)"**.

### TABLE 15-1: TIME OUT IN VARIOUS SITUATIONS

| Oscillator Configuration | Power-up | | Brown-out Reset | | Wake-up from Sleep |
|---|---|---|---|---|---|
| | $\overline{PWRTE}$ = 0 | $\overline{PWRTE}$ = 1 | $\overline{PWRTE}$ = 0 | $\overline{PWRTE}$ = 1 | |
| XT, HS, LP | TPWRT + 1024•TOSC | 1024•TOSC | TPWRT + 1024•TOSC | 1024•TOSC | 1024•TOSC |
| RC, EC, INTOSC | TPWRT | — | TPWRT | — | — |

### TABLE 15-2: STATUS/PCON BITS AND THEIR SIGNIFICANCE

| $\overline{POR}$ | $\overline{BOR}$ | $\overline{TO}$ | $\overline{PD}$ | Condition |
|---|---|---|---|---|
| 0 | x | 1 | 1 | Power-on Reset |
| 1 | 0 | 1 | 1 | Brown-out Reset |
| u | u | 0 | u | WDT Reset |
| u | u | 0 | 0 | WDT Wake-up |
| u | u | u | u | $\overline{MCLR}$ Reset during normal operation |
| u | u | 1 | 0 | $\overline{MCLR}$ Reset during Sleep |

**Legend:** u = unchanged, x = unknown

### TABLE 15-3: SUMMARY OF REGISTERS ASSOCIATED WITH BROWN-OUT

| Address | Name | Bit 7 | Bit 6 | Bit 5 | Bit 4 | Bit 3 | Bit 2 | Bit 1 | Bit 0 | Value on: POR, BOR | Value on all other Resets[1] |
|---|---|---|---|---|---|---|---|---|---|---|---|
| 03h, 103h 83h, 183h | STATUS | IRP | RP1 | RPO | $\overline{TO}$ | PD | Z | DC | C | 0001 1xxx | 000q quuu |
| 8Eh | PCON | — | — | — | SBOREN | — | — | $\overline{POR}$ | $\overline{BOR}$ | ---1 --qq | ---u --uu |

**Legend:** u = unchanged, x = unknown, — = unimplemented bit, reads as '0', q = value depends on condition. Shaded cells are not used by BOR.

**Note 1:** Other (non Power-up) Resets include $\overline{MCLR}$ Reset and Watchdog Timer Reset during normal operation.

**FIGURE 15-4:** TIME-OUT SEQUENCE ON POWER-UP (DELAYED MCLR): CASE 1

| Brown-out Reset | 000h | `0001 1uuu` | `---1 --10` |
| Interrupt Wake-up from Sleep | PC + 1[1] | `uuu1 0uuu` | `---u --uu` |

**Legend:** `u` = unchanged, `x` = unknown, — = unimplemented bit, reads as '0'.

**Note 1:** When the wake-up is due to an interrupt and global enable bit GIE is set, the PC is loaded with the interrupt vector (0004h) after execution of PC+1.

**Preliminary**

## 15.4 Interrupts

The PIC16F785 has 11 sources of interrupt:

- External Interrupt RA2/INT
- TMR0 Overflow Interrupt
- PORTA Change Interrupt
- 2 Comparator Interrupts
- A/D Interrupt
- Timer 1 Overflow Interrupt
- Timer 2 Match Interrupt
- EEPROM Data Write Interrupt
- Fail-Safe Clock Monitor Interrupt
- CCP Interrupt

The Interrupt Control register (INTCON) and Peripheral Interrupt register (PIR1) record individual interrupt requests in flag bits. The INTCON register also has individual and global interrupt enable bits.

A Global Interrupt Enable bit, GIE (INTCON<7>) enables (if set) all unmasked interrupts, or disables (if cleared) all interrupts. Individual interrupts can be disabled through their corresponding enable bits in INTCON register and PIE1 register. GIE is cleared on Reset.

The Return from Interrupt instruction, RETFIE, exits interrupt routine, as well as sets the GIE bit, which re-enables unmasked interrupts.

The following interrupt flags are contained in the INTCON register:

- INT Pin Interrupt
- PORTA Change Interrupt
- TMR0 Overflow Interrupt

The peripheral interrupt flags are contained in the special register PIR1. The corresponding interrupt enable bit is contained in special register PIE1.

The following interrupt flags are contained in the PIR1 register:

- EEPROM Data Write Interrupt
- A/D Interrupt
- 2 Comparator Interrupts
- Timer1 Overflow Interrupt
- Timer 2 Match Interrupt
- Fail-Safe Clock Monitor Interrupt
- CCP Interrupt

When an interrupt is serviced:

- The GIE is cleared to disable any further interrupt
- The return address is pushed onto the stack
- The PC is loaded with 0004h

For external interrupt events, such as the INT pin or PORTA change interrupt, the interrupt latency will be three or four instruction cycles. The exact latency depends upon when the interrupt event occurs (see Figure 15-8). The latency is the same for one or two-cycle instructions. Once in the Interrupt Service Routine, the source(s) of the interrupt can be determined by polling the interrupt flag bits. The interrupt flag bit(s) must be cleared in software before re-enabling interrupts to avoid multiple interrupt requests.

> **Note 1:** Individual interrupt flag bits are set, regardless of the status of their corresponding mask bit or the GIE bit.
>
> **2:** When an instruction that clears the GIE bit is executed, any interrupts that were pending for execution in the next cycle are ignored. The interrupts, which were ignored, are still pending to be serviced when the GIE bit is set again.

For additional information on Timer1, Timer2, comparators, A/D, Data EEPROM or CCP modules, refer to the respective peripheral section.

# PIC16F785

### 15.4.1 RA2/AN2/T0CKI/INT/C1OUT INTERRUPT

External interrupt on RA2/AN2/T0CKI/INT/C1OUT pin is edge-triggered; either rising, if INTEDG bit (OPTION<6>) is set, or falling, if INTEDG bit is clear. When a valid edge appears on the RA2/AN2/T0CKI/INT/C1OUT pin, the INTF bit (INTCON<1>) is set. This interrupt can be disabled by clearing the INTE control bit (INTCON<4>). The INTF bit must be cleared in software in the Interrupt Service Routine before re-enabling this interrupt. The RA2/AN2/T0CKI/INT/C1OUT interrupt can wake-up the processor from Sleep if the INTE bit was set prior to going into Sleep. The status of the GIE bit decides whether or not the processor branches to the interrupt vector following wake-up (0004h). See **Section 15.7 "Power-Down Mode (Sleep)"** for details on Sleep and Figure 15-10 for timing of wake-up from Sleep through RA2/AN2/T0CKI/INT/C1OUT interrupt.

| Note: | The ANSEL0 (91h), and ANSEL1 (93h) registers must be initialized to configure an analog channel as a digital input. Pins configured as analog inputs will read '0'. |
|---|---|

### 15.4.2 TMR0 INTERRUPT

An overflow (FFh → 00h) in the TMR0 register will set the T0IF (INTCON<2>) bit. The interrupt can be enabled/disabled by setting/clearing T0IE (INTCON<5>) bit. See **Section 5.0 "Timer0 Module"** for operation of the Timer0 module.

### 15.4.3 PORTA INTERRUPT

An input change on PORTA change sets the RAIF (INTCON<0>) bit. The interrupt can be enabled/disabled by setting/clearing the RAIE (INTCON<3>) bit. Plus, individual pins can be configured through the IOCA register.

| Note: | If a change on the I/O pin should occur when the read operation is being executed (start of the Q2 cycle), then the RAIF interrupt flag may not get set. |
|---|---|

**FIGURE 15-7:**     **INTERRUPT LOGIC**
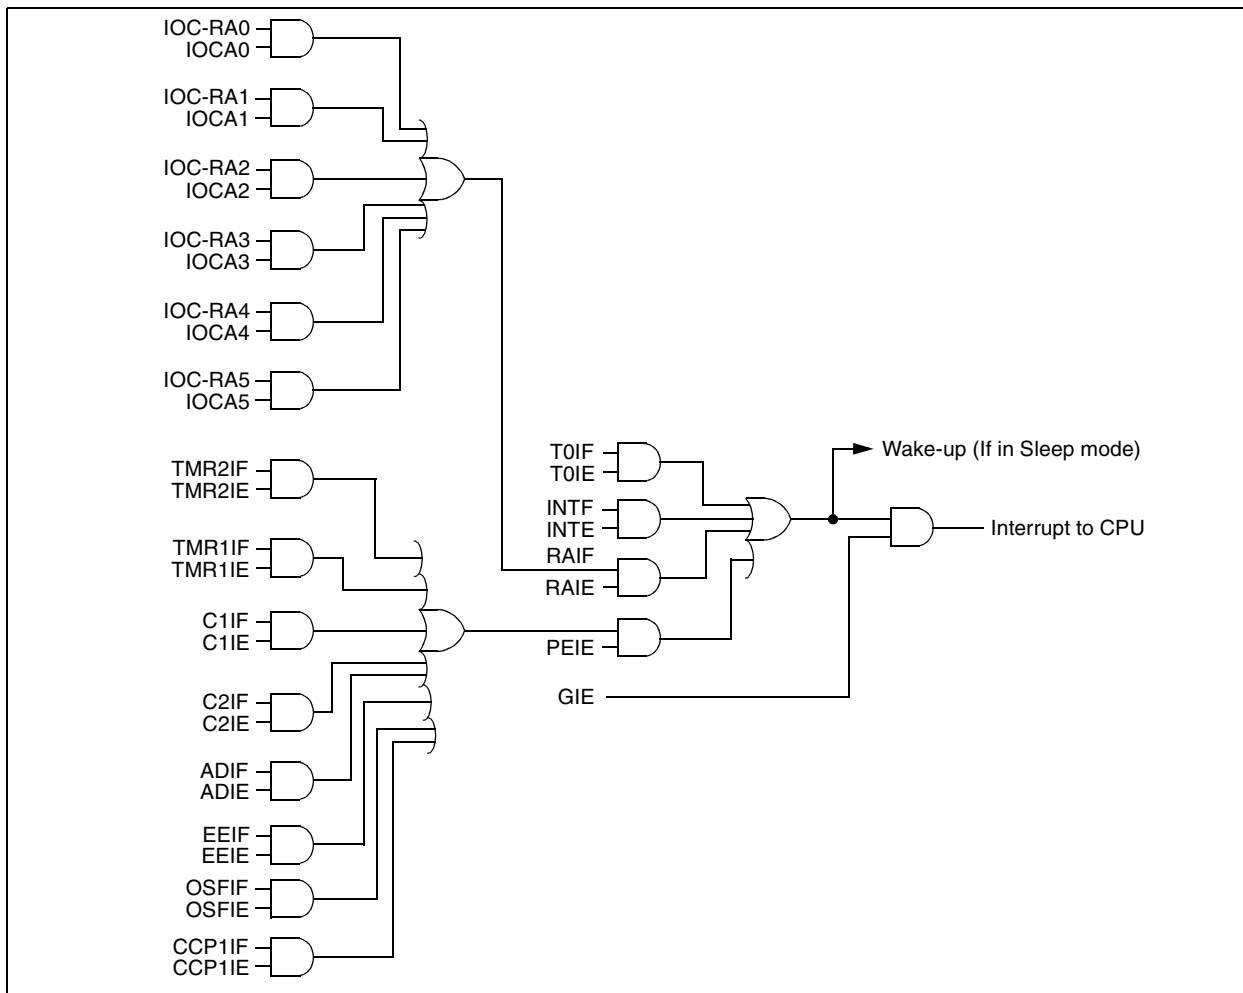

**FIGURE 15-8:** **INT PIN INTERRUPT TIMING**

Note 1: INTF flag is sampled here (every Q1).
2: Asynchronous interrupt latency = 3 – 4 TCY. Synchronous latency = 3 TCY, where TCY = instruction cycle time. Latency is the same whether Inst (PC) is a single cycle or a 2-cycle instruction.
3: CLKOUT is available only in INTOSC and RC Oscillator modes.
4: For minimum width of INT pulse, refer to AC specifications in **Section 18.0 "Electrical Specifications"**.
5: INTF is enabled to be set any time during the Q4 – Q1 cycles.

**TABLE 15-6:** **SUMMARY OF INTERRUPT REGISTERS**

| Address | Name | Bit 7 | Bit 6 | Bit 5 | Bit 4 | Bit 3 | Bit 2 | Bit 1 | Bit 0 | Value on: POR, BOR | Value on all other Resets |
|---------|------|-------|-------|-------|-------|-------|-------|-------|-------|--------------------|---------------------------|

| 0Ch | PIR1 | EEIF | ADIF | CCP1IF | C2IF | C1IF | OSFIF | TMR2IF | TMR1IF | 0000 0000 | 0000 0000 |
| 8Ch | PIE1 | EEIE | ADIE | CCP1IE | C2IE | C1IE | OSFIE | TMR2IE | TMR1IE | 0000 0000 | 0000 0000 |

**Legend:** x = unknown, u = unchanged, — = unimplemented read as '0', q = value depends upon condition.
Shaded cells are not used by the Interrupt module.

## 15.5 Context Saving During Interrupts

During an interrupt, only the return PC value is saved on the stack. Typically, users may wish to save key registers during an interrupt (e.g., W and Status registers). This must be implemented in software.

Since the last 16 bytes of all banks are common in the PIC16F785 (See Figure 2-2), temporary holding registers W_TEMP and STATUS_TEMP should be placed in here. These 16 locations do not require banking therefore, making it easier to save and restore context. The same code shown in Example 15-1 can be used to:

- Store the W register
- Store the Status register
- Execute the ISR code
- Restore the Status (and Bank Select Bit register)
- Restore the W register

| Note: | The PIC16F785 normally does not require saving the PCLATH. However, if computed GOTO's are used in the ISR and the main code, the PCLATH must be saved and restored in the ISR. |
|---|---|

**EXAMPLE 15-1: SAVING STATUS AND W REGISTERS IN RAM**

```
    MOVWF   W_TEMP              ;Copy W to TEMP register
    SWAPF   STATUS,W           ;Swap status to be saved into W (swap does not affect status)
    CLRF    STATUS             ;bank 0, regardless of current bank, Clears IRP,RP1,RP0
    MOVWF   STATUS_TEMP        ;Save status to bank zero STATUS_TEMP register
    :
    :(ISR)                     ;Insert user code here
    :
    SWAPF   STATUS_TEMP,W      ;Swap STATUS_TEMP register into W
                               ;(sets bank to original state)
    MOVWF   STATUS             ;Move W into Status register
    SWAPF   W_TEMP,F           ;Swap W_TEMP
    SWAPF   W_TEMP,W           ;Swap W_TEMP into W
```

## 15.6    Watchdog Timer (WDT)

For PIC16F785, the WDT has been modified from previous PIC16F devices. The new WDT is code and functionally compatible with previous PIC16F WDT modules and adds a 16-bit prescaler to the WDT. This allows the user to scale the value for the WDT and TMR0 at the same time. In addition, the WDT timeout value can be extended to 268 seconds. WDT is cleared under certain conditions described in Table 15-7.

### 15.6.1    WDT OSCILLATOR

The WDT derives its time base from the 31 kHz LFINTOSC. The LTS bit does not reflect that the LFINTOSC is enabled (OSCON<1>).

The value of WDTCON is '---0 1000' on all Resets. This gives a nominal time base of 16 ms, which is compatible with the time base generated with previous PIC16F microcontroller versions.

Note: When the Oscillator Start-up Timer (OST) is invoked, the WDT is held in Reset, because the WDT Ripple Counter is used by the OST to perform the oscillator delay count. When the OST count has expired, the WDT will begin counting (if enabled).

A new prescaler has been added to the path between the INTRC and the multiplexers used to select the path for the WDT. This prescaler is 16 bits and can be programmed to divide the INTRC by 128 to 65536, giving the time base used for the WDT a nominal range of 1 ms to 268s.

### 15.6.2    WDT CONTROL

The WDTE bit is located in the Configuration Word. When set, the WDT runs continuously.

When the WDTE bit in the Configuration Word register is set, the SWDTEN bit (WDTCON<0>) has no effect. If WDTE is clear, then the SWDTEN bit can be used to enable and disable the WDT. Setting the bit will enable it and clearing the bit will disable it.

The PSA and PS<2:0> bits (OPTION_REG) have the same function as in previous versions of the PIC16F family of microcontrollers. See **Section 5.0 "Timer0 Module"** for more information.

### FIGURE 15-9:        WATCHDOG TIMER BLOCK DIAGRAM

Note 1: This is the shared Timer0/WDT prescaler. See **Section 5.4 "Prescaler"** for more information.
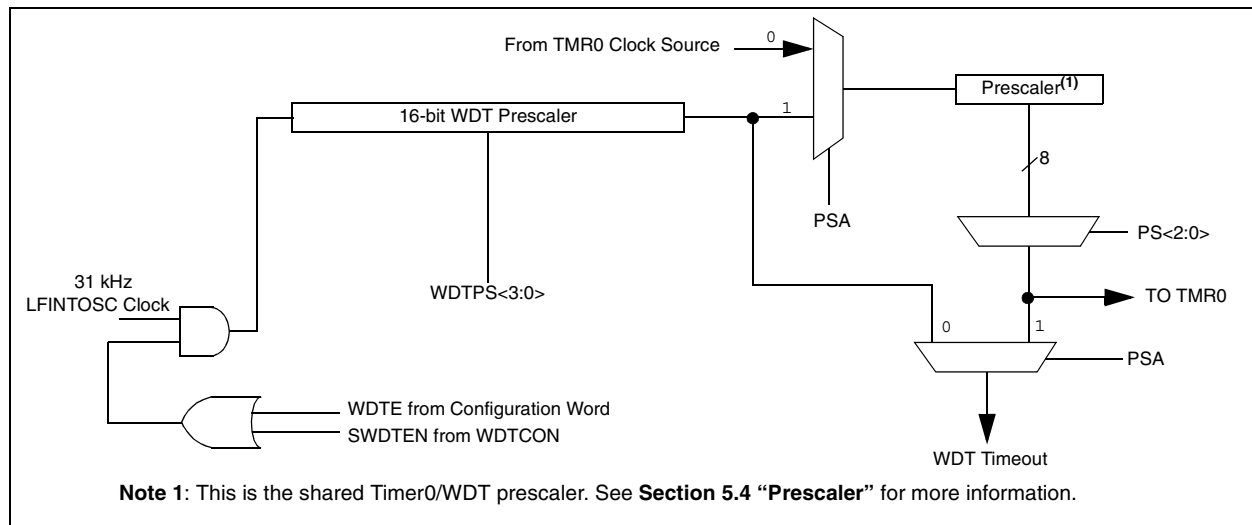

### TABLE 15-7:    WDT STATUS

**Note   1:**    See Register 15-1 for operation of all Configuration Word bits.

## 15.7 Power-Down Mode (Sleep)

The Power-down mode is entered by executing a `SLEEP` instruction.

If the Watchdog Timer is enabled:

- WDT will be cleared but keeps running.
- PD bit in the Status register is cleared.
- $\overline{TO}$ bit is set.
- Oscillator driver is turned off.
- I/O ports maintain the status they had before `SLEEP` was executed (driving high, low or high-impedance).

For lowest current consumption in this mode, all I/O pins should be either at VDD or VSS, with no external circuitry drawing current from the I/O pin, and all unused peripheral modules should be disabled. Digital I/O pins that are high-impedance inputs should be pulled high or low externally to avoid switching currents caused by floating inputs. The T0CKI input should also be at VDD or VSS for lowest current consumption. The contribution from on-chip pull-ups on PORTA should be considered.

The $\overline{MCLR}$ pin must be at a logic high level.

> **Note:** It should be noted that a Reset generated by a WDT time out does not drive $\overline{MCLR}$ pin low.

### 15.7.1 WAKE-UP FROM SLEEP

The device can wake-up from Sleep through one of the following events:

1. External Reset input on $\overline{MCLR}$ pin
2. Watchdog Timer Wake-up (if WDT was enabled)
3. Interrupt from RA2/AN2/T0CKI/INT/C1OUT pin, PORTA change or a peripheral interrupt.

The first event will cause a device Reset. The two latter events are considered a continuation of program execution. The $\overline{TO}$ and PD bits in the Status register can be used to determine the cause of device Reset. The PD bit, which is set on power-up, is cleared when Sleep is invoked. $\overline{TO}$ bit is cleared if WDT Wake-up occurred.

The following peripheral interrupts can wake the device from Sleep:

1. TMR1 interrupt. Timer1 must be operating as an asynchronous counter.
2. CCP Capture mode interrupt
3. A/D conversion (when A/D clock source is RC)
4. EEPROM write operation completion
5. Comparator output changes state
6. Interrupt-on-change
7. External Interrupt from INT pin

Other peripherals cannot generate interrupts since, during Sleep, no on-chip clocks are present.

When the `SLEEP` instruction is being executed, the next instruction (PC + 1) is pre-fetched. For the device to wake-up through an interrupt event, the corresponding interrupt enable bit (and PIE bit where applicable) must be set (enabled). Wake-up is regardless of the state of the GIE bit. If the GIE bit is clear (disabled), the device continues execution at the instruction after the `SLEEP` instruction. If the GIE bit is set (enabled), the device executes the instruction after the `SLEEP` instruction, then branches to the interrupt address (0004h). In cases where the execution of the instruction following `SLEEP` is not desirable, the user should have a `NOP` after the `SLEEP` instruction.

> **Note:** If the global interrupts are disabled (GIE is cleared), but any interrupt source has both its interrupt enable bit and the corresponding interrupt flag bits set, the device will immediately wake-up from Sleep. The `SLEEP` instruction is completely executed.

The WDT is cleared when the device wakes up from Sleep, regardless of the source of wake-up.

### 15.7.2 WAKE-UP USING INTERRUPTS

When global interrupts are disabled (GIE cleared) and any interrupt source has both its interrupt enable bit and interrupt flag bit set, one of the following will occur:

- If the interrupt occurs **before** the execution of a `SLEEP` instruction, the `SLEEP` instruction will complete as a `NOP`. Therefore, the WDT and WDT prescaler and postscaler (if enabled) will not be cleared, the $\overline{TO}$ bit will not be set and the PD bit will not be cleared.
- If the interrupt occurs **during or after** the execution of a `SLEEP` instruction, the device will immediately wake-up from Sleep. The `SLEEP` instruction will be completely executed before the wake-up. Therefore, the WDT and WDT prescaler and postscaler (if enabled) will be cleared, the $\overline{TO}$ bit will be set, and the PD bit will be cleared.

Even if the flag bits were checked before executing a `SLEEP` instruction, it may be possible for flag bits to become set before the `SLEEP` instruction completes. To determine whether a `SLEEP` instruction executed, test the PD bit. If the PD bit is set, the `SLEEP` instruction was executed as a `NOP`.

To ensure that the WDT is cleared, a `CLRWDT` instruction should be executed before a `SLEEP` instruction.

# PIC16F785

**FIGURE 15-10:** **WAKE-UP FROM SLEEP THROUGH INTERRUPT**[1]

**Note 1:** XT, HS or LP Oscillator mode assumed.
**2:** T$_{OST}$ = 1024T$_{OSC}$ (drawing not to scale). This delay does not apply to EC, RC and INTOSC Oscillator modes.
**3:** GIE = '1' assumed. In this case after wake-up, the processor jumps to 0004h.
   If GIE = '0', execution will continue in-line.
**4:** CLKOUT is not available in XT, HS, LP or EC Oscillator modes, but shown here for timing reference.

**Preliminary**
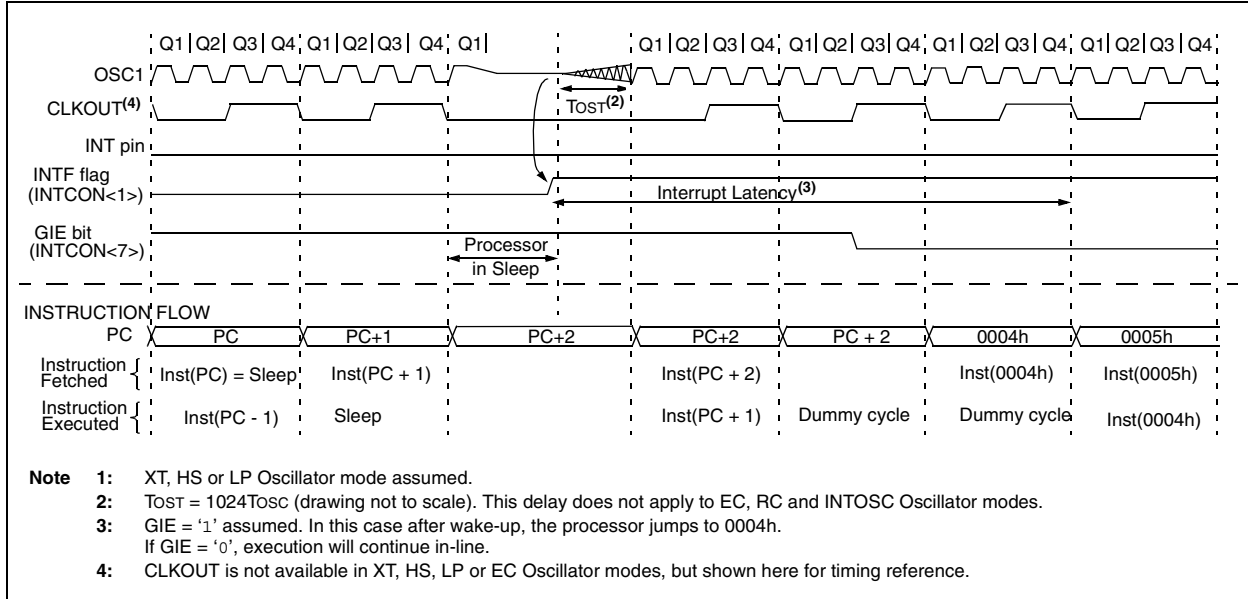

## 15.8 Code Protection

If the code protection bit(s) have not been programmed, the on-chip program memory can be read out using ICSP for verification purposes.

> **Note:** The entire data EEPROM and Flash program memory will be erased when the code protection is turned off by performing a bulk erase. See the *PIC16F785 Memory Programming Specification* (DS41237) for more information.

## 15.9 ID Locations

Four memory locations (2000h – 2003h) are designated as ID locations where the user can store checksum or other code identification numbers. These locations are not accessible during normal execution, but are readable and writable during Program/Verify. Only the Least Significant 7 bits of the ID locations are used.

## 15.10 In-Circuit Serial Programming

The PIC16F785 microcontrollers can be serially programmed while in the end application circuit. This is simply done with five lines:

- clock
- data
- power
- ground
- programming voltage

This allows customers to manufacture boards with unprogrammed devices and then program the microcontroller just before shipping the product. This also allows the most recent firmware or a custom firmware to be programmed.

The device is placed into a Program/Verify mode by holding the RA0 and RA1 pins low, while raising the MCLR (VPP) pin from VIL to VIHH. See the *PIC16F785 Memory Programming Specification* (DS41237) for more information. RA0 becomes the programming data and RA1 becomes the programming clock. Both RA0 and RA1 are Schmitt Trigger inputs in this mode.

After Reset, to place the device into Program/Verify mode, the program counter (PC) is at location 00h. A 6-bit command is then supplied to the device. Depending on the command, 14 bits of program data are then supplied to or from the device, depending on whether the command was a load or a read. For complete details of serial programming, please refer to the *PIC16F785 Memory Programming Specification* (DS41237).

A typical In-Circuit Serial Programming connection is shown in Figure 15-11.

**FIGURE 15-11: TYPICAL IN-CIRCUIT SERIAL PROGRAMMING CONNECTION**
## 15.11 In-Circuit Debugger

In-circuit debugging requires clock, data and $\overline{\text{MCLR}}$ pins. A special 28-pin PIC16F785 ICD device is used with MPLAB® ICD 2 to provide separate clock, data and $\overline{\text{MCLR}}$ pins so that no pins are lost for these functions leaving all 18 of the PIC16F785 I/O pins available to the user during debug operation.

This special ICD device is mounted on the top of a header and its signals are routed to the MPLAB ICD 2 connector. On the bottom of the header is a 20-pin socket that plugs into the user's target via the 20-pin stand-off connector.

When the $\overline{\text{ICD}}$ pin on the PIC16F785 ICD device is held low, the In-Circuit Debugger functionality is enabled. This function allows simple debugging functions when used with MPLAB ICD 2. When the microcontroller has this feature enabled, some of the resources are not available for general use. Table 15-9 shows which features are consumed by the background debugger:

### TABLE 15-9: DEBUGGER RESOURCES

| Resource | Description |
|---|---|
| I/O pins | ICDCLK, ICDDATA |
| Stack | 1 level |
| Program Memory | Address 0h must be `NOP` 700h – 7FFh |

For more information, see *MPLAB® ICD 2 In-Circuit Debugger User's Guide* (DS51292), available on Microchip's web site (www.microchip.com).

PIC16F785 - ICD

## 16.0 INSTRUCTION SET SUMMARY

The PIC16F785 instruction set is highly orthogonal and is comprised of three basic categories:

- **Byte-oriented** operations
- **Bit-oriented** operations
- **Literal and control** operations

Each PIC16 instruction is a 14-bit word divided into an **opcode,** which specifies the instruction type and one or more **operands,** which further specify the operation of the instruction. The format for each of the categories is presented in Figure 16-1, while the various opcode fields are summarized in Table 16-1.

Table 16-2 lists the instructions recognized by the MPASM™ assembler. A complete description of each instruction is also available in the *PICmicro® Mid-Range Reference Manual* (DS33023).

For **byte-oriented** instructions, 'f' represents a file register designator and 'd' represents a destination designator. The file register designator specifies which file register is to be used by the instruction.

The destination designator specifies where the result of the operation is to be placed. If 'd' is zero, the result is placed in the W register. If 'd' is one, the result is placed in the file register specified in the instruction.

For **bit-oriented** instructions, 'b' represents a bit field designator, which selects the bit affected by the operation, while 'f' represents the address of the file in which the bit is located.

For **literal and control** operations, 'k' represents an 8-bit or 11-bit constant, or literal value.

One instruction cycle consists of four oscillator periods; for an oscillator frequency of 4 MHz, this gives a normal instruction execution time of 1 µs. All instructions are executed within a single instruction cycle, unless a conditional test is true, or the program counter is changed as a result of an instruction. When this occurs, the execution takes two instruction cycles, with the second cycle executed as a NOP.

| Note: | To maintain upward compatibility with future products, <u>do not use</u> the OPTION and TRIS instructions. |
|---|---|

All instruction examples use the format '0xhh' to represent a hexadecimal number, where 'h' signifies a hexadecimal digit.

## 16.1 READ-MODIFY-WRITE OPERATIONS

Any instruction that specifies a file register as part of the instruction performs a Read-Modify-Write (R-M-W) operation. The register is read, the data is modified, and the result is stored according to either the instruction, or the destination designator 'd'. A read operation is always performed, even if the instruction is a write command.

For example, a CLRF PORTA instruction will read PORTA, clear all the data bits, then write the result back to PORTA. This example would have the unintended result of clearing the condition that set the RAIF flag.

**TABLE 16-1: OPCODE FIELD DESCRIPTIONS**

| Field | Description |
|---|---|
| f | Register file address (0x00 to 0x7F) |
| W | Working register (accumulator) |
| b | Bit address within an 8-bit file register |
| k | Literal field, constant data or label |
| x | Don't care location (= 0 or 1). The assembler will generate code with x = 0. It is the recommended form of use for compatibility with all Microchip software tools. |
| d | Destination select; d = 0: store result in W, d = 1: store result in file register f. Default is d = 1. |
| PC | Program Counter |
| TO | Time-out bit |
| PD | Power-down bit |

**FIGURE 16-1: GENERAL FORMAT FOR INSTRUCTIONS**

Byte-oriented file register operations

```
13        8 7 6            0
 OPCODE   | d | f (FILE #)
```
d = 0 for destination W
d = 1 for destination f
f = 7-bit file register address

Bit-oriented file register operations

```
13      10 9   7 6         0
 OPCODE  |b (BIT #)| f (FILE #)
```
b = 3-bit bit address
f = 7-bit file register address

Literal and control operations

General
```
13          8 7           0
 OPCODE     | k (literal)
```
k = 8-bit immediate value

CALL and GOTO instructions only
```
13    11 10              0
 OPCODE | k (literal)
```
k = 11-bit immediate value

# PIC16F785

## TABLE 16-2: PIC16F785 INSTRUCTION SET

| Mnemonic, Operands | | Description | Cycles | 14-Bit Opcode | | Status Affected | Notes |
|---|---|---|---|---|---|---|---|
| | | | | **MSb** | **LSb** | | |
| **BYTE-ORIENTED FILE REGISTER OPERATIONS** | | | | | | | |
| ADDWF | f, d | Add W and f | 1 | 00 0111 dfff | ffff | C,DC,Z | **1,2** |
| ANDWF | f, d | AND W with f | 1 | 00 0101 dfff | ffff | Z | **1,2** |

| MOVWF | f | Move W to f | 1 | 00 0000 lfff | ffff | | |
| NOP | - | No Operation | 1 | 00 0000 0xx0 | 0000 | | |
| RLF | f, d | Rotate Left f through Carry | 1 | 00 1101 dfff | ffff | C | **1,2** |
| RRF | f, d | Rotate Right f through Carry | 1 | 00 1100 dfff | ffff | C | **1,2** |
| SUBWF | f, d | Subtract W from f | 1 | 00 0010 dfff | ffff | C,DC,Z | **1,2** |
| SWAPF | f, d | Swap nibbles in f | 1 | 00 1110 dfff | ffff | | **1,2** |
| XORWF | f, d | Exclusive OR W with f | 1 | 00 0110 dfff | ffff | Z | **1,2** |
| **BIT-ORIENTED FILE REGISTER OPERATIONS** | | | | | | | |
| BCF | f, b | Bit Clear f | 1 | 01 00bb bfff | ffff | | **1,2** |
| BSF | f, b | Bit Set f | 1 | 01 01bb bfff | ffff | | **1,2** |
| BTFSC | f, b | Bit Test f, Skip if Clear | 1 (2) | 01 10bb bfff | ffff | | **3** |
| BTFSS | f, b | Bit Test f, Skip if Set | 1 (2) | 01 11bb bfff | ffff | | **3** |
| **LITERAL AND CONTROL OPERATIONS** | | | | | | | |
| ADDLW | k | Add literal and W | 1 | 11 111x kkkk | kkkk | C,DC,Z | |
| ANDLW | k | AND literal with W | 1 | 11 1001 kkkk | kkkk | Z | |
| CALL | k | Call subroutine | 2 | 10 0kkk kkkk | kkkk | | |
| CLRWDT | - | Clear Watchdog Timer | 1 | 00 0000 0110 | 0100 | $\overline{TO},\overline{PD}$ | |
| GOTO | k | Go to address | 2 | 10 1kkk kkkk | kkkk | | |
| IORLW | k | Inclusive OR literal with W | 1 | 11 1000 kkkk | kkkk | Z | |
| MOVLW | k | Move literal to W | 1 | 11 00xx kkkk | kkkk | | |
| RETFIE | - | Return from interrupt | 2 | 00 0000 0000 | 1001 | | |
| RETLW | k | Return with literal in W | 2 | 11 01xx kkkk | kkkk | | |
| RETURN | - | Return from Subroutine | 2 | 00 0000 0000 | 1000 | | |
| SLEEP | - | Go into Standby mode | 1 | 00 0000 0110 | 0011 | $\overline{TO},\overline{PD}$ | |
| SUBLW | k | Subtract W from literal | 1 | 11 110x kkkk | kkkk | C,DC,Z | |
| XORLW | k | Exclusive OR literal with W | 1 | 11 1010 kkkk | kkkk | Z | |

**Note 1:** When an I/O register is modified as a function of itself (e.g., MOVF PORTA, 1), the value used will be that value present on the pins themselves. For example, if the data latch is '1' for a pin configured as input and is driven low by an external device, the data will be written back with a '0'.

**2:** If this instruction is executed on the TMR0 register (and, where applicable, d = 1), the prescaler will be cleared if assigned to the Timer0 module.

**3:** If Program Counter (PC) is modified, or a conditional test is true, the instruction requires two cycles. The second cycle is executed as a NOP.

---

Note: Additional information on the mid-range instruction set is available in the *PICmicro® Mid-Range MCU Family Reference Manual* (DS33023).

---

## 16.2    Instruction Descriptions

| ADDLW | Add Literal and W |
|---|---|
| Syntax: | [*label*] ADDLW    k |
| Operands: | 0 ≤ k ≤ 255 |
| Operation: | (W) + k → (W) |
| Status Affected: | C, DC, Z |
| Description: | The contents of the W register are added to the eight-bit literal 'k' and the result is placed in the W register. |

| ADDWF | Add W and f |
|---|---|
| Syntax: | [*label*] ADDWF    f,d |
| Operands: | 0 ≤ f ≤ 127<br>d ∈ [0,1] |
| Operation: | (W) + (f) → (destination) |
| Status Affected: | C, DC, Z |
| Description: | Add the contents of the W register with register 'f'. If 'd' is 0, the result is stored in the W register. If 'd' is 1, the result is stored back in register 'f'. |

| ANDLW | AND Literal with W |
|---|---|
| Syntax: | [*label*] ANDLW    k |
| Operands: | 0 ≤ k ≤ 255 |
| Operation: | (W) .AND. (k) → (W) |
| Status Affected: | Z |
| Description: | The contents of W register are AND'ed with the eight-bit literal 'k'. The result is placed in the W register. |

| ANDWF | AND W with f |
|---|---|
| Syntax: | [*label*] ANDWF    f,d |
| Operands: | 0 ≤ f ≤ 127<br>d ∈ [0,1] |
| Operation: | (W) .AND. (f) → (destination) |
| Status Affected: | Z |
| Description: | AND the W register with register 'f'. If 'd' is 0, the result is stored in the W register. If 'd' is 1, the result is stored back in register 'f'. |

| BCF | Bit Clear f |
|---|---|
| Syntax: | [*label*] BCF    f,b |
| Operands: | 0 ≤ f ≤ 127<br>0 ≤ b ≤ 7 |
| Operation: | 0 → (f<b>) |
| Status Affected: | None |
| Description: | Bit 'b' in register 'f' is cleared. |

| BSF | Bit Set f |
|---|---|
| Syntax: | [*label*] BSF    f,b |
| Operands: | 0 ≤ f ≤ 127<br>0 ≤ b ≤ 7 |
| Operation: | 1 → (f<b>) |
| Status Affected: | None |
| Description: | Bit 'b' in register 'f' is set. |

| BTFSC | Bit Test f, Skip if Clear |
|---|---|
| Syntax: | [*label*] BTFSC   f,b |
| Operands: | 0 ≤ f ≤ 127<br>0 ≤ b ≤ 7 |
| Operation: | skip if (f<b>) = 0 |
| Status Affected: | None |
| Description: | If bit 'b' in register 'f' is '1', the next instruction is executed.<br>If bit 'b', in register 'f', is '0', the next instruction is discarded, and a NOP is executed instead, making this a 2-cycle instruction. |

| BTFSS | Bit Test f, Skip if Set |
|---|---|
| Syntax: | [*label*] BTFSS   f,b |
| Operands: | 0 ≤ f ≤ 127<br>0 ≤ b < 7 |
| Operation: | skip if (f<b>) = 1 |
| Status Affected: | None |
| Description: | If bit 'b' in register 'f' is '0', the next instruction is executed.<br>If bit 'b' is '1', then the next instruction is discarded and a NOP is executed instead, making this a 2-cycle instruction. |

# PIC16F785

| CALL | Call Subroutine |
|------|-----------------|
| Syntax: | [ *label* ]   CALL   k |
| Operands: | 0 ≤ k ≤ 2047 |
| Operation: | (PC)+ 1→ TOS,<br>k → PC<10:0>,<br>(PCLATH<4:3>) → PC<12:11> |
| Status Affected: | None |
| Description: | Call Subroutine. First, return address (PC+1) is pushed onto the stack. The eleven-bit immediate address is loaded into PC bits <10:0>. The upper bits of the PC are loaded from PCLATH. CALL is a two-cycle instruction. |

| CLRF | Clear f |
|------|---------|
| Syntax: | [*label*]   CLRF   f |
| Operands: | 0 ≤ f ≤ 127 |
| Operation: | 00h → (f)<br>1 → Z |
| Status Affected: | Z |
| Description: | The contents of register 'f' are cleared and the Z bit is set. |

| CLRW | Clear W |
|------|---------|
| Syntax: | [ *label* ]   CLRW |
| Operands: | None |
| Operation: | 00h → (W)<br>1 → Z |
| Status Affected: | Z |
| Description: | W register is cleared. Zero bit (Z) is set. |

| CLRWDT | Clear Watchdog Timer |
|--------|----------------------|
| Syntax: | [ *label* ]   CLRWDT |
| Operands: | None |
| Operation: | 00h → WDT<br>0 → WDT prescaler,<br>1 → $\overline{TO}$<br>1 → PD |
| Status Affected: | $\overline{TO}$, PD |
| Description: | CLRWDT instruction resets the Watchdog Timer. It also resets the prescaler of the WDT. Status bits $\overline{TO}$ and PD are set. |

| COMF | Complement f |
|------|--------------|
| Syntax: | [ *label* ] COMF   f,d |
| Operands: | 0 ≤ f ≤ 127<br>d ∈ [0,1] |
| Operation: | $(\bar{f})$ → (destination) |
| Status Affected: | Z |
| Description: | The contents of register 'f' are complemented. If 'd' is 0, the result is stored in W. If 'd' is 1, the result is stored back in register 'f'. |

| DECF | Decrement f |
|------|-------------|
| Syntax: | [*label*]   DECF f,d |
| Operands: | 0 ≤ f ≤ 127<br>d ∈ [0,1] |
| Operation: | (f) - 1 → (destination) |
| Status Affected: | Z |
| Description: | Decrement register 'f'. If 'd' is 0, the result is stored in the W register. If 'd' is 1, the result is stored back in register 'f'. |

| DECFSZ | Decrement f, Skip if 0 |
|--------|------------------------|
| Syntax: | [ *label* ]   DECFSZ f,d |
| Operands: | 0 ≤ f ≤ 127<br>d ∈ [0,1] |
| Operation: | (f) - 1 → (destination);<br>skip if result = 0 |
| Status Affected: | None |
| Description: | The contents of register 'f' are decremented. If 'd' is 0, the result is placed in the W register. If 'd' is 1, the result is placed back in register 'f'.<br>If the result is 1, the next instruction is executed. If the result is 0, then a NOP is executed instead, making it a 2-cycle instruction. |

# PIC16F785

| **GOTO** | **Unconditional Branch** |
|---|---|
| Syntax: | [ *label* ]  GOTO  k |
| Operands: | 0 ≤ k ≤ 2047 |
| Operation: | k → PC<10:0><br>PCLATH<4:3> → PC<12:11> |
| Status Affected: | None |
| Description: | GOTO is an unconditional branch. The eleven-bit immediate value is loaded into PC bits <10:0>. The upper bits of PC are loaded from PCLATH<4:3>. GOTO is a two-cycle instruction. |

| **INCF** | **Increment f** |
|---|---|
| Syntax: | [ *label* ]  INCF  f,d |
| Operands: | 0 ≤ f ≤ 127<br>d ∈ [0,1] |
| Operation: | (f) + 1 → (destination) |
| Status Affected: | Z |
| Description: | The contents of register 'f' are incremented. If 'd' is 0, the result is placed in the W register. If 'd' is 1, the result is placed back in register 'f'. |

| **INCFSZ** | **Increment f, Skip if 0** |
|---|---|
| Syntax: | [ *label* ]  INCFSZ  f,d |
| Operands: | 0 ≤ f ≤ 127<br>d ∈ [0,1] |
| Operation: | (f) + 1 → (destination),<br> skip if result = 0 |
| Status Affected: | None |
| Description: | The contents of register 'f' are incremented. If 'd' is 0, the result is placed in the W register. If 'd' is 1, the result is placed back in register 'f'.<br>If the result is 1, the next instruction is executed. If the result is 0, a NOP is executed instead, making it a 2-cycle instruction. |

| **IORLW** | **Inclusive OR Literal with W** |
|---|---|
| Syntax: | [ *label* ]  IORLW  k |
| Operands: | 0 ≤ k ≤ 255 |
| Operation: | (W) .OR. k → (W) |
| Status Affected: | Z |
| Description: | The contents of the W register are OR'ed with the eight-bit literal 'k'. The result is placed in the W register. |

| **IORWF** | **Inclusive OR W with f** |
|---|---|
| Syntax: | [ *label* ]  IORWF  f,d |
| Operands: | 0 ≤ f ≤ 127<br>d ∈ [0,1] |
| Operation: | (W) .OR. (f) → (destination) |
| Status Affected: | Z |
| Description: | Inclusive OR the W register with register 'f'. If 'd' is 0, the result is placed in the W register. If 'd' is 1, the result is placed back in register 'f'. |

| **MOVF** | **Move f** |
|---|---|
| Syntax: | [ *label* ]  MOVF  f,d |
| Operands: | 0 ≤ f ≤ 127<br>d ∈ [0,1] |
| Operation: | (f) → (dest) |
| Status Affected: | Z |
| Encoding: | 00 \| 1000 \| dfff \| ffff |
| Description: | The contents of register 'f' is moved to a destination dependent upon the status of d. If 'd' = 0, destination is W register. If 'd' = 1, the destination is file register 'f' itself. 'd' = 1 is useful to test a file register since status flag Z is affected. |
| Words: | 1 |
| Cycles: | 1 |
| Example | MOVF    FSR, 0 |

After Instruction

    W   =    value in FSR
         register
    Z   =    1

# PIC16F785

**MOVLW**          **Move Literal to W**

| Syntax: | [ *label* ]   MOVLW   k |
|---|---|
| Operands: | $0 \leq k \leq 255$ |
| Operation: | $k \rightarrow (W)$ |
| Status Affected: | None |
| Encoding: | `11` `00xx` `kkkk` `kkkk` |
| Description: | The eight bit literal 'k' is loaded into W register. The don't cares will assemble as `0`'s. |
| Words: | 1 |
| Cycles: | 1 |
| Example | `MOVLW   0x5A` |

After Instruction
       W   =   0x5A

**MOVWF**          **Move W to f**

| Syntax: | [ *label* ]   MOVWF     f |
|---|---|
| Operands: | $0 \leq f \leq 127$ |
| Operation: | $(W) \rightarrow (f)$ |
| Status Affected: | None |
| Encoding: | `00` `0000` `1fff` `ffff` |
| Description: | Move data from W register to register 'f'. |
| Words: | 1 |
| Cycles: | 1 |
| Example | `MOVWF   OPTION` |

Before Instruction
       OPTION  =   0xFF
       W       =   0x4F
After Instruction
       OPTION  =   0x4F
       W       =   0x4F

**NOP**          **No Operation**

| Syntax: | [ *label* ]   NOP |
|---|---|
| Operands: | None |
| Operation: | No operation |
| Status Affected: | None |
| Encoding: | `00` `0000` `0xx0` `0000` |
| Description: | No operation. |
| Words: | 1 |
| Cycles: | 1 |
| Example | `NOP` |

**RETFIE**          **Return from Interrupt**

| Syntax: | [ *label* ]   RETFIE |
|---|---|
| Operands: | None |
| Operation: | $TOS \rightarrow PC$,<br>$1 \rightarrow GIE$ |
| Status Affected: | None |
| Encoding: | `00` `0000` `0000` `1001` |
| Description: | Return from Interrupt. Stack is POPed and Top of Stack (TOS) is loaded in the PC. Interrupts are enabled by setting Global Interrupt Enable bit, GIE (INTCON<7>). This is a two-cycle instruction. |
| Words: | 1 |
| Cycles: | 2 |
| Example | `RETFIE` |

After Interrupt
       PC  =   TOS
       GIE =   1

**Preliminary**

| RETLW | Return with Literal in W |
|---|---|
| Syntax: | [ *label* ]   RETLW   k |
| Operands: | 0 ≤ k ≤ 255 |
| Operation: | k → (W);<br>TOS → PC |
| Status Affected: | None |
| Encoding: | 11 \| 01xx \| kkkk \| kkkk |
| Description: | The W register is loaded with the eight bit literal 'k'. The program counter is loaded from the top of the stack (the return address). This is a two-cycle instruction. |
| Words: | 1 |
| Cycles: | 2 |

| | |
|---|---|
| Example | CALL TABLE;W contains table |
| | ;offset value |
| TABLE | •        ;W now has table value |
| | • |
| | • |

| | RETLW kn   ; End of table |

Before Instruction
    W   =   0x07
After Instruction
    W   =   value of k8

| RETURN | Return from Subroutine |
|---|---|
| Syntax: | [ *label* ]   RETURN |
| Operands: | None |
| Operation: | TOS → PC |
| Status Affected: | None |
| Description: | Return from subroutine. The stack is POPed and the top of the stack (TOS) is loaded into the program counter. This is a two-cycle instruction. |

| RLF | Rotate Left f through Carry |
|---|---|
| Syntax: | [ *label* ]   RLF   f,d |
| Operands: | 0 ≤ f ≤ 127<br>d ∈ [0,1] |
| Operation: | See description below |
| Status Affected: | C |
| Encoding: | 00 \| 1101 \| dfff \| ffff |
| Description: | The contents of register 'f' are rotated one bit to the left through the Carry Flag. If 'd' is 0, the result is placed in the W register. If 'd' is 1, the result is stored back in register 'f'. |

| | |
|---|---|
| Words: | 1 |
| Cycles: | 1 |
| Example | RLF   REG1,0 |
Before Instruction
    REG1   =   1110 0110
    C      =   0
After Instruction
    REG1   =   1110 0110
    W      =   1100 1100
    C      =   1

# PIC16F785

| **RRF** | **Rotate Right f through Carry** |
|---|---|
| Syntax: | [ *label* ]   RRF   f,d |
| Operands: | $0 \le f \le 127$<br>$d \in [0,1]$ |
| Operation: | See description below |
| Status Affected: | C |
| Encoding: | `00` `1100` `dfff` `ffff` |
| Description: | The contents of register 'f' are rotated one bit to the right through the Carry Flag. If 'd' is `0` the result is placed in the W register. If 'd' is `1` the result is placed back in register 'f'. |

```
   ┌──────────────────────────┐
   │  ┌───┐    ┌────────────┐  │
   └─→│ C │──→ │ REGISTER F │──┘
      └───┘    └────────────┘
```
| | |
|---|---|
| Words: | 1 |
| Cycles: | 1 |
| Example | `RRF      REG1, 0` |

Before Instruction
    REG1 = 1110 0110
    C    = 0
After Instruction
    REG1 = 1110 0110
    W    = 0111 0011
    C    = 0

| **SLEEP** | |
|---|---|
| Syntax: | [*label*]   SLEEP |
| Operands: | None |
| Operation: | 00h $\rightarrow$ WDT,<br>0 $\rightarrow$ WDT prescaler,<br>1 $\rightarrow$ $\overline{TO}$,<br>0 $\rightarrow$ $\overline{PD}$ |
| Status Affected: | $\overline{TO}$, $\overline{PD}$ |
| Encoding: | `00` `0000` `0110` `0011` |
| Description: | The power-down Status bit, $\overline{PD}$ is cleared. Time out Status bit, $\overline{TO}$ is set. Watchdog Timer and its prescaler are cleared. The processor is put into SLEEP mode with the oscillator stopped. |
| Words: | 1 |
| Cycles: | 1 |
| Example: | `SLEEP` |

| **SUBLW** | **Subtract W from Literal** |
|---|---|
| Syntax: | [*label*]      SUBLW   k |
| Operands: | $0 \le k \le 255$ |
| Operation: | k - (W) $\rightarrow$ (W) |
| Status Affected: | C, DC, Z |
| Encoding: | `11` `110x` `kkkk` `kkkk` |
| Description: | The W register is subtracted (2's complement method) from the eight bit literal 'k'. The result is placed in the W register. |
| Words: | 1 |
| Cycles: | 1 |
| Example 1: | `SUBLW    0x02` |

Before Instruction
    W   =  1
    C   =  ?
After Instruction
    W   =  1
    C   =  1; result is positive

| Example 2: | Before Instruction |
|---|---|

    W   =  2
    C   =  ?
After Instruction
    W   =  0
    C   =  1; result is zero

| Example 3: | Before Instruction |
|---|---|

    W   =  3
    C   =  ?
After Instruction
    W   =  0xFF
    C   =  0; result is negative

**Preliminary**

| SUBWF | Subtract W from f |
|---|---|
| Syntax: | [*label*]    SUBWF   f,d |
| Operands: | $0 \leq f \leq 127$<br>$d \in [0,1]$ |
| Operation: | (f) - (W) $\rightarrow$ (dest) |
| Status Affected: | C, DC, Z |

Encoding:

| 00 | 0010 | dfff | ffff |
|---|---|---|---|

| | |
|---|---|
| Description: | Subtract (2's complement method) W register from register 'f'. If 'd' is `0` the result is stored in the W register. If 'd' is `1` the result is stored back in register 'f'. |
| Words: | 1 |
| Cycles: | 1 |

Example 1:    SUBWF    REG1, 1

Before Instruction

    REG1 = 3
    W    = 2
    C    = ?

After Instruction

    REG1 = 1
    W    = 2
    C    = 1; result is positive
    Z    = 0
    DC   = 1

Example 2:    Before Instruction

    REG1 = 2
    W    = 2
    C    = ?

After Instruction

    REG1 = 0
    W    = 2
    C    = 1; result is zero
    Z    = DC = 1

Example 3:    Before Instruction

    REG1 = 1
    W    = 2
    C    = ?

After Instruction

    REG1 = 0xFF
    W    = 2
    C    = 0; result is negative
    Z    = DC = 0

| SWAPF | Swap Nibbles in f |
|---|---|
| Syntax: | [ *label* ]    SWAPF  f,d |
| Operands: | $0 \leq f \leq 127$<br>$d \in [0,1]$ |
| Operation: | (f<3:0>) $\rightarrow$ (dest<7:4>),<br>(f<7:4>) $\rightarrow$ (dest<3:0>) |
| Status Affected: | None |

Encoding:

| 00 | 1110 | dfff | ffff |
|---|---|---|---|

| | |
|---|---|
| Description: | The upper and lower nibbles of register 'f' are exchanged. If 'd' is `0` the result is placed in W register. If 'd' is `1` the result is placed in register 'f'. |
| Words: | 1 |
| Cycles: | 1 |

Example    SWAPF    REG1, 0

Before Instruction

    REG1  =  0xA5

After Instruction

    REG1 =  0xA5
    W    =  0x5A

| TRIS | Load TRIS Register |
|---|---|
| Syntax: | [ *label* ]   TRIS    f |
| Operands: | $5 \leq f \leq 6$ |
| Operation: | (W) $\rightarrow$ TRIS register f; |
| Status Affected: | None |

Encoding:

| 00 | 0000 | 0110 | 0fff |
|---|---|---|---|

| | |
|---|---|
| Description: | The instruction is supported for code compatibility with the PIC16C5X products. Since TRIS registers are readable and writable, the user can directly address them. |
| Words: | 1 |
| Cycles: | 1 |
| Example | |

**To maintain upward compatibility with future PICmicro® products, do not use this instruction.**

# PIC16F785

| XORLW | Exclusive OR Literal with W |
|---|---|
| Syntax: | [*label*]    XORLW   k |
| Operands: | $0 \leq k \leq 255$ |
| Operation: | (W) .XOR. k $\rightarrow$ (W) |
| Status Affected: | Z |
| Encoding: | 11 \| 1010 \| kkkk \| kkkk |
| Description: | The contents of the W register are XOR'ed with the eight bit literal 'k'. The result is placed in the W register. |
| Words: | 1 |
| Cycles: | 1 |
| Example: | XORLW   0xAF |

Before Instruction

W  = 0xB5

After Instruction

W  = 0x1A

| XORWF | Exclusive OR W with f |
|---|---|
| Syntax: | [ *label* ]    XORWF   f,d |
| Operands: | $0 \leq f \leq 127$<br>$d \in [0,1]$ |
| Operation: | (W) .XOR. (f) $\rightarrow$ (dest) |
| Status Affected: | Z |
| Encoding: | 00 \| 0110 \| dfff \| ffff |
| Description: | Exclusive OR the contents of the W register with register 'f'. If 'd' is 0 the result is stored in the W register. If 'd' is 1 the result is stored back in register 'f'. |
| Words: | 1 |
| Cycles: | 1 |
| Example | XORWF   REG1, 1 |

Before Instruction

REG1 =  0xAF
W     =  0xB5

After Instruction

REG1 =  0x1A
W     =  0xB5

## 17.0    DEVELOPMENT SUPPORT

The PICmicro® microcontrollers are supported with a full range of hardware and software development tools:

- Integrated Development Environment
  - MPLAB® IDE Software
- Assemblers/Compilers/Linkers
  - MPASM™ Assembler
  - MPLAB C17 and MPLAB C18 C Compilers
  - MPLINK™ Object Linker/
    MPLIB™ Object Librarian
  - MPLAB C30 C Compiler
  - MPLAB ASM30 Assembler/Linker/Library
- Simulators
  - MPLAB SIM Software Simulator
  - MPLAB dsPIC30 Software Simulator
- Emulators
  - MPLAB ICE 2000 In-Circuit Emulator
  - MPLAB ICE 4000 In-Circuit Emulator
- In-Circuit Debugger
  - MPLAB ICD 2
- Device Programmers
  - PRO MATE® II Universal Device Programmer
  - PICSTART® Plus Development Programmer
  - MPLAB PM3 Device Programmer
- Low-Cost Demonstration Boards
  - PICDEM™ 1 Demonstration Board
  - PICDEM.net™ Demonstration Board
  - PICDEM 2 Plus Demonstration Board
  - PICDEM 3 Demonstration Board
  - PICDEM 4 Demonstration Board
  - PICDEM 17 Demonstration Board
  - PICDEM 18R Demonstration Board
  - PICDEM LIN Demonstration Board
  - PICDEM USB Demonstration Board
- Evaluation Kits
  - KEELOQ® Security ICs
  - PICDEM MSC
  - microID® RFID
  - CAN
  - PowerSmart® Battery Management
  - Analog

## 17.1    MPLAB Integrated Development Environment Software

The MPLAB IDE software brings an ease of software development previously unseen in the 8/16-bit micro-controller market. The MPLAB IDE is a Windows® based application that contains:

- An interface to debugging tools
  - simulator
  - programmer (sold separately)
  - emulator (sold separately)
  - in-circuit debugger (sold separately)
- A full-featured editor with color coded context
- A multiple project manager
- Customizable data windows with direct edit of contents
- High-level source code debugging
- Mouse over variable inspection
- Extensive on-line help

The MPLAB IDE allows you to:

- Edit your source files (either assembly or C)
- One touch assemble (or compile) and download to PICmicro emulator and simulator tools (automatically updates all project information)
- Debug using:
  - source files (assembly or C)
  - mixed assembly and C
  - machine code

MPLAB IDE supports multiple debugging tools in a single development paradigm, from the cost effective simulators, through low-cost in-circuit debuggers, to full-featured emulators. This eliminates the learning curve when upgrading to tools with increasing flexibility and power.

## 17.2    MPASM Assembler

The MPASM assembler is a full-featured, universal macro assembler for all PICmicro MCUs.

The MPASM assembler generates relocatable object files for the MPLINK object linker, Intel® standard HEX files, MAP files to detail memory usage and symbol ref-erence, absolute LST files that contain source lines and generated machine code and COFF files for debugging.

The MPASM assembler features include:

- Integration into MPLAB IDE projects
- User defined macros to streamline assembly code
- Conditional assembly for multi-purpose source files
- Directives that allow complete control over the assembly process

# PIC16F785

## 17.3 MPLAB C17 and MPLAB C18 C Compilers

The MPLAB C17 and MPLAB C18 Code Development Systems are complete ANSI C compilers for Microchip's PIC17CXXX and PIC18CXXX family of microcontrollers. These compilers provide powerful integration capabilities, superior code optimization and ease of use not found with other compilers.

For easy source level debugging, the compilers provide symbol information that is optimized to the MPLAB IDE debugger.

## 17.4 MPLINK Object Linker/ MPLIB Object Librarian

The MPLINK object linker combines relocatable objects created by the MPASM assembler and the MPLAB C17 and MPLAB C18 C compilers. It can link relocatable objects from precompiled libraries, using directives from a linker script.

The MPLIB object librarian manages the creation and modification of library files of precompiled code. When a routine from a library is called from a source file, only the modules that contain that routine will be linked in with the application. This allows large libraries to be used efficiently in many different applications.

The object linker/library features include:

* Efficient linking of single libraries instead of many smaller files
* Enhanced code maintainability by grouping related modules together
* Flexible creation of libraries with easy module listing, replacement, deletion and extraction

## 17.5 MPLAB C30 C Compiler

The MPLAB C30 C compiler is a full-featured, ANSI compliant, optimizing compiler that translates standard ANSI C programs into dsPIC30F assembly language source. The compiler also supports many command line options and language extensions to take full advantage of the dsPIC30F device hardware capabilities and afford fine control of the compiler code generator.

MPLAB C30 is distributed with a complete ANSI C standard library. All library functions have been validated and conform to the ANSI C library standard. The library includes functions for string manipulation, dynamic memory allocation, data conversion, timekeeping and math functions (trigonometric, exponential and hyperbolic). The compiler provides symbolic information for high-level source debugging with the MPLAB IDE.

## 17.6 MPLAB ASM30 Assembler, Linker and Librarian

MPLAB ASM30 assembler produces relocatable machine code from symbolic assembly language for dsPIC30F devices. MPLAB C30 compiler uses the assembler to produce it's object file. The assembler generates relocatable object files that can then be archived or linked with other relocatable object files and archives to create an executable file. Notable features of the assembler include:

* Support for the entire dsPIC30F instruction set
* Support for fixed-point and floating-point data
* Command line interface
* Rich directive set
* Flexible macro language
* MPLAB IDE compatibility

## 17.7 MPLAB SIM Software Simulator

The MPLAB SIM software simulator allows code development in a PC hosted environment by simulating the PICmicro series microcontrollers on an instruction level. On any given instruction, the data areas can be examined or modified and stimuli can be applied from a file, or user defined key press, to any pin. The execution can be performed in Single-Step, Execute Until Break or Trace mode.

The MPLAB SIM simulator fully supports symbolic debugging using the MPLAB C17 and MPLAB C18 C Compilers, as well as the MPASM assembler. The software simulator offers the flexibility to develop and debug code outside of the laboratory environment, making it an excellent, economical software development tool.

## 17.8 MPLAB SIM30 Software Simulator

The MPLAB SIM30 software simulator allows code development in a PC hosted environment by simulating the dsPIC30F series microcontrollers on an instruction level. On any given instruction, the data areas can be examined or modified and stimuli can be applied from a file, or user defined key press, to any of the pins.

The MPLAB SIM30 simulator fully supports symbolic debugging using the MPLAB C30 C Compiler and MPLAB ASM30 assembler. The simulator runs in either a Command Line mode for automated tasks, or from MPLAB IDE. This high-speed simulator is designed to debug, analyze and optimize time intensive DSP routines.

**Preliminary**

## 17.9 MPLAB ICE 2000 High-Performance Universal In-Circuit Emulator

The MPLAB ICE 2000 universal in-circuit emulator is intended to provide the product development engineer with a complete microcontroller design tool set for PICmicro microcontrollers. Software control of the MPLAB ICE 2000 in-circuit emulator is advanced by the MPLAB Integrated Development Environment, which allows editing, building, downloading and source debugging from a single environment.

The MPLAB ICE 2000 is a full-featured emulator system with enhanced trace, trigger and data monitoring features. Interchangeable processor modules allow the system to be easily reconfigured for emulation of different processors. The universal architecture of the MPLAB ICE in-circuit emulator allows expansion to support new PICmicro microcontrollers.

The MPLAB ICE 2000 in-circuit emulator system has been designed as a real-time emulation system with advanced features that are typically found on more expensive development tools. The PC platform and Microsoft® Windows 32-bit operating system were chosen to best make these features available in a simple, unified application.

## 17.10 MPLAB ICE 4000 High-Performance Universal In-Circuit Emulator

The MPLAB ICE 4000 universal in-circuit emulator is intended to provide the product development engineer with a complete microcontroller design tool set for high-end PICmicro microcontrollers. Software control of the MPLAB ICE in-circuit emulator is provided by the MPLAB Integrated Development Environment, which allows editing, building, downloading and source debugging from a single environment.

The MPLAB ICD 4000 is a premium emulator system, providing the features of MPLAB ICE 2000, but with increased emulation memory and high-speed performance for dsPIC30F and PIC18XXXX devices. Its advanced emulator features include complex triggering and timing, up to 2 Mb of emulation memory and the ability to view variables in real-time.

The MPLAB ICE 4000 in-circuit emulator system has been designed as a real-time emulation system with advanced features that are typically found on more expensive development tools. The PC platform and Microsoft Windows 32-bit operating system were chosen to best make these features available in a simple, unified application.

## 17.11 MPLAB ICD 2 In-Circuit Debugger

Microchip's In-Circuit Debugger, MPLAB ICD 2, is a powerful, low-cost, run-time development tool, connecting to the host PC via an RS-232 or high-speed USB interface. This tool is based on the Flash PICmicro MCUs and can be used to develop for these and other PICmicro microcontrollers. The MPLAB ICD 2 utilizes the in-circuit debugging capability built into the Flash devices. This feature, along with Microchip's In-Circuit Serial Programming™ (ICSP™) protocol, offers cost effective in-circuit Flash debugging from the graphical user interface of the MPLAB Integrated Development Environment. This enables a designer to develop and debug source code by setting breakpoints, single-stepping and watching variables, CPU status and peripheral registers. Running at full speed enables testing hardware and applications in real-time. MPLAB ICD 2 also serves as a development programmer for selected PICmicro devices.

## 17.12 PRO MATE II Universal Device Programmer

The PRO MATE II is a universal, CE compliant device programmer with programmable voltage verification at V$_{DDMIN}$ and V$_{DDMAX}$ for maximum reliability. It features an LCD display for instructions and error messages and a modular detachable socket assembly to support various package types. In Stand-Alone mode, the PRO MATE II device programmer can read, verify and program PICmicro devices without a PC connection. It can also set code protection in this mode.

## 17.13 MPLAB PM3 Device Programmer

The MPLAB PM3 is a universal, CE compliant device programmer with programmable voltage verification at V$_{DDMIN}$ and V$_{DDMAX}$ for maximum reliability. It features a large LCD display (128 x 64) for menus and error messages and a modular detachable socket assembly to support various package types. The ICSP™ cable assembly is included as a standard item. In Stand-alone mode, the MPLAB PM3 device programmer can read, verify and program PICmicro devices without a PC connection. It can also set code protection in this mode. MPLAB PM3 connects to the host PC via an RS-232 or USB cable. MPLAB PM3 has high-speed communications and optimized algorithms for quick programming of large memory devices and incorporates an SD/MMC card for file storage and secure data applications.

## 17.14 PICSTART Plus Development Programmer

The PICSTART Plus development programmer is an easy-to-use, low-cost, prototype programmer. It connects to the PC via a COM (RS-232) port. MPLAB Integrated Development Environment software makes using the programmer simple and efficient. The PICSTART Plus development programmer supports most PICmicro devices up to 40 pins. Larger pin count devices, such as the PIC16C92X and PIC17C76X, may be supported with an adapter socket. The PICSTART Plus development programmer is CE compliant.

## 17.15 PICDEM 1 PICmicro Demonstration Board

The PICDEM 1 demonstration board demonstrates the capabilities of the PIC16C5X (PIC16C54 to PIC16C58A), PIC16C61, PIC16C62X, PIC16C71, PIC16C8X, PIC17C42, PIC17C43 and PIC17C44. All necessary hardware and software is included to run basic demo programs. The sample microcontrollers provided with the PICDEM 1 demonstration board can be programmed with a PRO MATE II device programmer or a PICSTART Plus development programmer. The PICDEM 1 demonstration board can be connected to the MPLAB ICE in-circuit emulator for testing. A prototype area extends the circuitry for additional application components. Features include an RS-232 interface, a potentiometer for simulated analog input, push button switches and eight LEDs.

## 17.16 PICDEM.net Internet/Ethernet Demonstration Board

The PICDEM.net demonstration board is an Internet/Ethernet demonstration board using the PIC18F452 microcontroller and TCP/IP firmware. The board supports any 40-pin DIP device that conforms to the standard pinout used by the PIC16F877 or PIC18C452. This kit features a user friendly TCP/IP stack, web server with HTML, a 24L256 Serial EEPROM for Xmodem download to web pages into Serial EEPROM, ICSP/MPLAB ICD 2 interface connector, an Ethernet interface, RS-232 interface and a 16 x 2 LCD display. Also included is the book and CD-ROM *"TCP/IP Lean, Web Servers for Embedded Systems,"* by Jeremy Bentham

## 17.17 PICDEM 2 Plus Demonstration Board

The PICDEM 2 Plus demonstration board supports many 18, 28 and 40-pin microcontrollers, including PIC16F87X and PIC18FXX2 devices. All the necessary hardware and software is included to run the demonstration programs. The sample microcontrollers provided with the PICDEM 2 demonstration board can be programmed with a PRO MATE II device programmer, PICSTART Plus development programmer, or MPLAB ICD 2 with a Universal Programmer Adapter. The MPLAB ICD 2 and MPLAB ICE in-circuit emulators may also be used with the PICDEM 2 demonstration board to test firmware. A prototype area extends the circuitry for additional application components. Some of the features include an RS-232 interface, a 2 x 16 LCD display, a piezo speaker, an on-board temperature sensor, four LEDs and sample PIC18F452 and PIC16F877 Flash microcontrollers.

## 17.18 PICDEM 3 PIC16C92X Demonstration Board

The PICDEM 3 demonstration board supports the PIC16C923 and PIC16C924 in the PLCC package. All the necessary hardware and software is included to run the demonstration programs.

## 17.19 PICDEM 4 8/14/18-Pin Demonstration Board

The PICDEM 4 can be used to demonstrate the capabilities of the 8, 14 and 18-pin PIC16XXXX and PIC18XXXX MCUs, including the PIC16F818/819, PIC16F87/88, PIC16F62XA and the PIC18F1320 family of microcontrollers. PICDEM 4 is intended to showcase the many features of these low pin count parts, including LIN and Motor Control using ECCP. Special provisions are made for low-power operation with the supercapacitor circuit and jumpers allow on-board hardware to be disabled to eliminate current draw in this mode. Included on the demo board are provisions for Crystal, RC or Canned Oscillator modes, a five volt regulator for use with a nine volt wall adapter or battery, DB-9 RS-232 interface, ICD connector for programming via ICSP and development with MPLAB ICD 2, 2 x 16 liquid crystal display, PCB footprints for H-Bridge motor driver, LIN transceiver and EEPROM. Also included are: header for expansion, eight LEDs, four potentiometers, three push buttons and a proto-typing area. Included with the kit is a PIC16F627A and a PIC18F1320. Tutorial firmware is included along with the User's Guide.

## 17.20 PICDEM 17 Demonstration Board

The PICDEM 17 demonstration board is an evaluation board that demonstrates the capabilities of several Microchip microcontrollers, including PIC17C752, PIC17C756A, PIC17C762 and PIC17C766. A programmed sample is included. The PRO MATE II device programmer, or the PICSTART Plus development programmer, can be used to reprogram the device for user tailored application development. The PICDEM 17 demonstration board supports program download and execution from external on-board Flash memory. A generous prototype area is available for user hardware expansion.

## 17.21 PICDEM 18R PIC18C601/801 Demonstration Board

The PICDEM 18R demonstration board serves to assist development of the PIC18C601/801 family of Microchip microcontrollers. It provides hardware implementation of both 8-bit Multiplexed/Demultiplexed and 16-bit Memory modes. The board includes 2 Mb external Flash memory and 128 Kb SRAM memory, as well as serial EEPROM, allowing access to the wide range of memory types supported by the PIC18C601/801.

## 17.22 PICDEM LIN PIC16C43X Demonstration Board

The powerful LIN hardware and software kit includes a series of boards and three PICmicro microcontrollers. The small footprint PIC16C432 and PIC16C433 are used as slaves in the LIN communication and feature on-board LIN transceivers. A PIC16F874 Flash microcontroller serves as the master. All three microcontrollers are programmed with firmware to provide LIN bus communication.

## 17.23 PICkit™ 1 Flash Starter Kit

A complete "development system in a box", the PICkit Flash Starter Kit includes a convenient multi-section board for programming, evaluation and development of 8/14-pin Flash PIC® microcontrollers. Powered via USB, the board operates under a simple Windows GUI. The PICkit 1 Starter Kit includes the User's Guide (on CD ROM), PICkit 1 tutorial software and code for various applications. Also included are MPLAB® IDE (Integrated Development Environment) software, software and hardware "Tips 'n Tricks for 8-pin Flash PIC® Microcontrollers" Handbook and a USB interface cable. Supports all current 8/14-pin Flash PIC microcontrollers, as well as many future planned devices.

## 17.24 PICDEM USB PIC16C7X5 Demonstration Board

The PICDEM USB Demonstration Board shows off the capabilities of the PIC16C745 and PIC16C765 USB microcontrollers. This board provides the basis for future USB products.

## 17.25 Evaluation and Programming Tools

In addition to the PICDEM series of circuits, Microchip has a line of evaluation kits and demonstration software for these products.

• KEELOQ evaluation and programming tools for Microchip's HCS Secure Data Products
• CAN developers kit for automotive network applications
• Analog design boards and filter design software
• PowerSmart battery charging evaluation/ calibration kits
• IrDA® development kit
• microID development and rfLab™ development software
• SEEVAL® designer kit for memory evaluation and endurance calculations
• PICDEM MSC demo boards for Switching mode power supply, high-power IR driver, delta sigma ADC and flow rate sensor

Check the Microchip web page and the latest Product Selector Guide for the complete list of demonstration and evaluation kits.

**NOTES:**

## 18.0   ELECTRICAL SPECIFICATIONS

**Absolute Maximum Ratings[†]**

Ambient temperature under bias.......................................................................................................... -40 to +125°C

Storage temperature ........................................................................................................... -65°C to +150°C

Voltage on $V_{DD}$ with respect to $V_{SS}$ ................................................................................................. -0.3 to +6.5V

Voltage on $\overline{MCLR}$ with respect to Vss ...........................................................................................-0.3 to +13.5V

Voltage on all other pins with respect to Vss ........................................................................ -0.3V to (VDD + 0.3V)

Total power dissipation[(1)] (PDIP and SOIC)............................................................................................. 800 mW

Total power dissipation[(1)] (SSOP) .......................................................................................................... 600 mW

Maximum current out of Vss pin ............................................................................................................. 300 mA

Maximum current into VDD pin ................................................................................................................ 250 mA

Input clamp current, IIK (VI < 0 or VI > VDD)..............................................................................................±20 mA

Output clamp current, IOK (Vo < 0 or Vo >VDD)........................................................................................±20 mA

Maximum output current sunk by any I/O pin........................................................................................... 25 mA

Maximum output current sourced by any I/O pin ..................................................................................... 25 mA

Maximum current sunk by PORTA, PORTB, and PORTC (combined) ......................................................... 200 mA

Maximum current sourced PORTA, PORTB, and PORTC (combined).......................................................... 200 mA

**Note 1:**   Power dissipation is calculated as follows: $P_{DIS} = V_{DD}$ x {$I_{DD}$ – $\sum I_{OH}$} + $\sum$ {$(V_{DD}$ – $V_{OH}$) x $I_{OH}$} + $\sum(V_{OI}$ x $I_{OL}$).

† NOTICE: Stresses above those listed under 'Absolute Maximum Ratings' may cause permanent damage to the device. This is a stress rating only and functional operation of the device at those or any other conditions above those indicated in the operation listings of this specification is not implied. Exposure to maximum rating conditions for extended periods may affect device reliability.

**Note:**   Voltage spikes below Vss at the $\overline{MCLR}$ pin, inducing currents greater than 80 mA, may cause latch-up. Thus, a series resistor of 50-100Ω should be used when applying a "low" level to the $\overline{MCLR}$ pin, rather than pulling this pin directly to Vss.

**FIGURE 18-1:** **PIC16F785 WITH ANALOG DISABLED VOLTAGE-FREQUENCY GRAPH,**
**-40°C ≤ TA ≤ +125°C**

**Note:** The shaded region indicates the permissible combinations of voltage and frequency.

| | | — | 2.4 | TBD | mA | 5.0 | |

**Legend:** TBD = To Be Determined.

† Data in 'Typ' column is at 5.0V, 25°C unless otherwise stated. These parameters are for design guidance only and are not tested.

**Note 1:** The test conditions for all I$_{DD}$ measurements in Active Operation mode are: OSC1 = external square wave, from rail to rail; all I/O pins tri-stated, pulled to V$_{DD}$; $\overline{MCLR}$ = V$_{DD}$; WDT disabled.

**2:** The supply current is mainly a function of the operating voltage and frequency. Other factors such as I/O pin loading and switching rate, oscillator type, internal code execution pattern and temperature also have an impact on the current consumption.

**3:** The peripheral current is the sum of the base I$_{DD}$ or I$_{PD}$ and the additional current consumed when this peripheral is enabled. The peripheral ∆ current can be determined by subtracting the base I$_{DD}$ or I$_{PD}$ current from this limit. Max values should be used when calculating total current consumption.

**4:** The power-down current in Sleep mode does not depend on the oscillator type. Power-down current is measured with the part in Sleep mode, with all I/O pins in high-impedance state and tied to V$_{DD}$. When A/D is off, it will not consume any current other than leakage current. the power-down current spec includes any such leakage from the A/D module.

**Preliminary**

\*      These parameters are characterized but not tested.

†      Data in 'Typ' column is at 5.0V, 25°C unless otherwise stated. These parameters are for design guidance only and are not tested.

**Note 1:** In RC oscillator configuration, the OSC1/CLKIN pin is a Schmitt Trigger input. It is not recommended to use an external clock in RC mode.

**2:** Negative current is defined as current sourced by the pin.

**3:** The leakage current on the MCLR pin is strongly dependent on the applied voltage level. The specified levels represent normal operating conditions. Higher leakage current may be measured at different input voltages.

# PIC16F785

## 18.5 Timing Parameter Symbology

The timing parameter symbols have been created with one of the following formats:

1. TppS2ppS
2. TppS

| T | | | | |
|---|---|---|---|---|
| F | Frequency | | T | Time |

Lowercase letters (pp) and their meanings:

| pp | | | | |
|---|---|---|---|---|
| cc | CCP1 | | osc | OSC1 |
| ck | CLKOUT | | rd | $\overline{RD}$ |
| cs | $\overline{CS}$ | | rw | $\overline{RD}$ or $\overline{WR}$ |
| di | SDI | | sc | SCK |
| do | SDO | | ss | $\overline{SS}$ |
| dt | Data in | | t0 | T0CKI |
| io | I/O port | | t1 | T1CKI |
| mc | $\overline{MCLR}$ | | wr | $\overline{WR}$ |

Uppercase letters and their meanings:

| S | | | | |
|---|---|---|---|---|
| F | Fall | | P | Period |
| H | High | | R | Rise |
| I | Invalid (High-impedance) | | V | Valid |
| L | Low | | Z | High-impedance |

### FIGURE 18-2: LOAD CONDITIONS

### FIGURE 18-3: EXTERNAL CLOCK TIMING

**Preliminary**          © 2004 Microchip Technology Inc.
**TABLE 18-1:    EXTERNAL CLOCK TIMING REQUIREMENTS**

| Param No. | Sym | Characteristic | Min | Typ† | Max | Units | Conditions |
|---|---|---|---|---|---|---|---|
| | FOSC | External CLKIN Frequency[1] | — | 32.768 | — | kHz | LP mode (complementary input only) |
| | | | DC | — | 4 | MHz | XT mode |
| | | | DC | — | 20 | MHz | HS mode |
| | | | DC | — | 20 | MHz | EC mode |
| | | Oscillator Frequency[1] | — | 32.768 | — | kHz | LP Osc mode |
| | | | — | 4 | — | MHz | INTOSC mode |
| | | | DC | — | 4 | MHz | RC Osc mode |
| | | | 0.1 | — | 4 | MHz | XT Osc mode |
| | | | 1 | — | 20 | MHz | HS Osc mode |
| 1 | TOSC | External CLKIN Period[1] | — | 0.3052 | — | µs | LP mode (complementary input only) |
| | | | 50 | — | ∞ | ns | HS Osc mode |
| | | | 50 | — | ∞ | ns | EC Osc mode |
| | | | 250 | — | ∞ | ns | XT Osc mode |
| | | Oscillator Period[1] | — | 0.3052 | — | µs | LP Osc mode |
| | | | — | 250 | — | ns | INTOSC mode |
| | | | 250 | — | — | ns | RC Osc mode |
| | | | 250 | — | 10,000 | ns | XT Osc mode |
| | | | 50 | — | 1,000 | ns | HS Osc mode |
| 2 | TCY | Instruction Cycle Time[1] | 200 | TCY | DC | ns | TCY = 4/FOSC |
| 3 | TosL, TosH | External CLKIN (OSC1) High External CLKIN Low | 2* | — | — | µs | LP oscillator, TOSC L/H duty cycle |
| | | | 20* | — | — | ns | HS oscillator, TOSC L/H duty cycle |
| | | | 100 * | — | — | ns | XT oscillator, TOSC L/H duty cycle |
| 4 | TosR, TosF | External CLKIN Rise External CLKIN Fall | — | — | 50* | ns | LP oscillator |
| | | | — | — | 25* | ns | XT oscillator |
| | | | — | — | 15* | ns | HS oscillator |

\*    These parameters are characterized but not tested.

†    Data in 'Typ' column is at 5V, 25°C unless otherwise stated. These parameters are for design guidance only and are not tested.

**Note 1:**  Instruction cycle period (TCY) equals four times the input oscillator time base period. All specified values are based on characterization data for that particular oscillator type under standard operating conditions with the device executing code. Exceeding these specified limits may result in an unstable oscillator operation and/or higher than expected current consumption. All devices are tested to operate at 'min' values with an external clock applied to OSC1 pin. When an external clock input is used, the 'max' cycle time limit is 'DC' (no clock) for all devices.

# PIC16F785

**TABLE 18-2: PRECISION INTERNAL OSCILLATOR PARAMETERS**

| Param No. | Sym | Characteristic | Freq Tolerance | Min | Typ† | Max | Units | Conditions |
|---|---|---|---|---|---|---|---|---|
| F10 | FOSC | Internal Calibrated INTOSC Frequency[1] | ±1% | 7.92 | 8.00 | 8.08 | MHz | VDD = 3.5V, 25°C |
| | | | ±2% | 7.84 | 8.00 | 8.16 | MHz | 2.5V ≤ VDD ≤ 5.5V 0°C ≤ TA ≤ +85°C |
| | | | ±5% | 7.60 | 8.00 | 8.40 | MHz | 2.0V ≤ VDD ≤ 5.5V -40°C ≤ TA ≤ +85°C (Ind.) -40°C ≤ TA ≤ +125°C (Ext.) |
| F14 | TIOSC ST | Oscillator wake-up from Sleep start-up time* | — | — | TBD | TBD | μs | VDD = 2.0V, -40°C to +85°C |
| | | | — | — | TBD | TBD | μs | VDD = 3.0V, -40°C to +85°C |
| | | | — | — | TBD | TBD | μs | VDD = 5.0V, -40°C to +85°C |

\* These parameters are characterized but not tested.

† Data in 'Typ' column is at 5.0V, 25°C unless otherwise stated. These parameters are for design guidance only and are not tested.

**Note 1:** To ensure these oscillator frequency tolerances, VDD and VSS must be capacitively decoupled as close to the device as possible. 0.1uF and 0.01uF values in parallel are recommended.

**FIGURE 18-4: CLKOUT AND I/O TIMING**

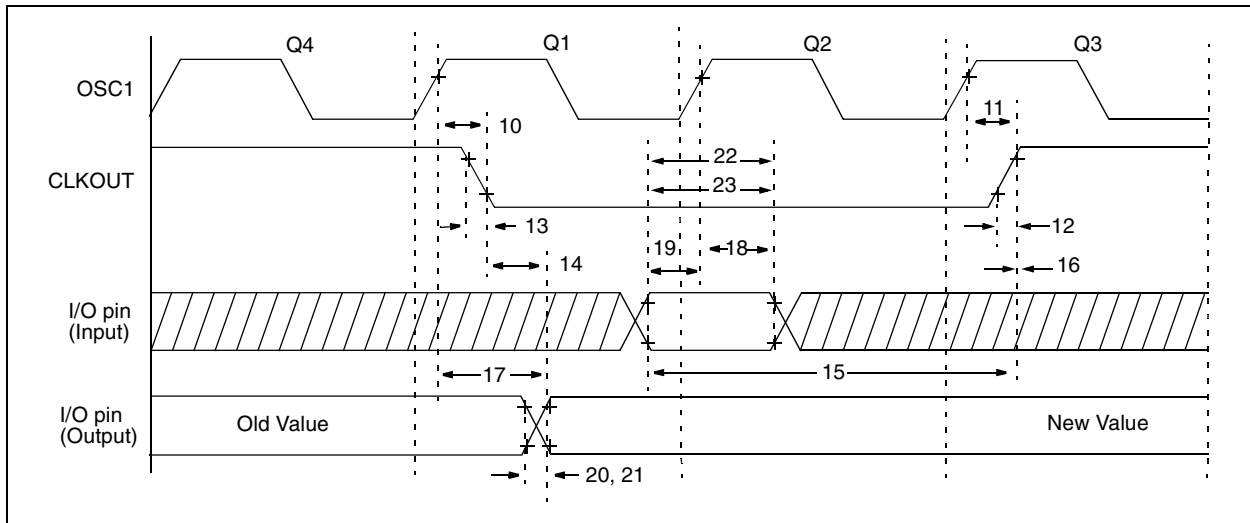

**TABLE 18-3: CLKOUT AND I/O TIMING REQUIREMENTS**

| Param No. | Sym | Characteristic | Min | Typ† | Max | Units | Conditions |
|---|---|---|---|---|---|---|---|
| 10 | TosH2ckL | OSC1↑ to CLOUT↓ | — | 75 | 200 | ns | **(Note 1)** |
| 11 | TosH2ckH | OSC1↑ to CLOUT↑ | — | 75 | 200 | ns | **(Note 1)** |
| 12 | TckR | CLKOUT rise time | — | 35 | 100 | ns | **(Note 1)** |
| 13 | TckF | CLKOUT fall time | — | 35 | 100 | ns | **(Note 1)** |
| 14 | TckL2ioV | CLKOUT↓ to Port out valid | — | — | 20 | ns | **(Note 1)** |
| 15 | TioV2ckH | Port in valid before CLKOUT↑ | TOSC + 200 ns | — | — | ns | **(Note 1)** |
| 16 | TckH2ioI | Port in hold after CLKOUT↑ | 0 | — | — | ns | **(Note 1)** |

\* These parameters are characterized but not tested.

† Data in 'Typ' column is at 5.0V, 25°C unless otherwise stated.

**Note 1:** Measurements are taken in RC mode where CLKOUT output is 4 x TOSC.

**TABLE 18-3: CLKOUT AND I/O TIMING REQUIREMENTS (CONTINUED)**

| Param No. | Sym | Characteristic | Min | Typ† | Max | Units | Conditions |
|---|---|---|---|---|---|---|---|
| 17 | TosH2ioV | OSC1↑ (Q1 cycle) to Port out valid | — | 50 | 150 * | ns | |
| | | | — | — | 300 | ns | |
| 18 | TosH2ioI | OSC1↑ (Q2 cycle) to Port input invalid (I/O in hold time) | 100 | — | — | ns | |
| 19 | TioV2osH | Port input valid to OSC1↑ (I/O in setup time) | 0 | — | — | ns | |
| 20 | TioR | Port output rise time | — | 10 | 40 | ns | |
| 21 | TioF | Port output fall time | — | 10 | 40 | ns | |
| 22 | Tinp | INT pin high or low time | 25 | — | — | ns | |
| 23 | Trbp | PORTA change INT high or low time | TCY | — | — | ns | |

* These parameters are characterized but not tested.

† Data in 'Typ' column is at 5.0V, 25°C unless otherwise stated.

**Note 1:** Measurements are taken in RC mode where CLKOUT output is 4 x TOSC.

**TABLE 18-12: PIC16F785 A/D CONVERTER CHARACTERISTICS**:

| Param No. | Sym | Characteristic | Min | Typ† | Max | Units | Conditions |
|---|---|---|---|---|---|---|---|
| A01 | NR | Resolution | — | — | 10 bits | bit | |
| A02 | EABS | Total Absolute Error*[1] | — | — | ±1 | LSb | VREF = 5.0V |
| A03 | EIL | Integral Error | — | — | ±1 | LSb | VREF = 5.0V |
| A04 | EDL | Differential Error | — | — | ±1 | LSb | No missing codes to 10 bits VREF = 5.0V |
| A05 | EFS | Full Scale Range | 2.2* | — | 5.5* | V | |
| A06 | EOFF | Offset Error | — | — | ±1 | LSb | VREF = 5.0V |
| A07 | EGN | Gain Error | — | — | ±1 | LSb | VREF = 5.0V |
| A10 | — | Monotonicity | — | guaranteed[2] | — | — | VSS ≤ VAIN ≤ VREF |
| A20 A20A | VREF | Reference Voltage | 2.2[4] 2.5 | — | — VDD + 0.3 | V | Absolute minimum to ensure 10-bit accuracy |
| A25 | VAIN | Analog Input Voltage | VSS | — | VREF[5] | V | |
| A30 | ZAIN | Recommended Impedance of Analog Voltage Source | — | — | 10 | kΩ | |
| A50 | IREF | VREF Input Current*[3] | 10 | — | 1000 | µA | During VAIN acquisition. Based on differential of VHOLD to VAIN. |
| | | | — | — | 10 | µA | During A/D conversion cycle. |

* These parameters are characterized but not tested.

† Data in 'Typ' column is at 5.0V, 25°C unless otherwise stated. These parameters are for design guidance only and are not tested.

**Note 1:** Total Absolute Error includes Integral, Differential, Offset and Gain Errors.

**2:** The A/D conversion result never decreases with an increase in the input voltage and has no missing codes.

**3:** VREF current is from external VREF or VDD pin, whichever is selected as reference input.

**4:** Only limited when VDD is at or below 2.5V. If VDD is above 2.5V, VREF is allowed to go as low as 1.0V.

**5:** Analog input voltages are allowed up to VDD, however the conversion accuracy is limited to VSS to VREF.

# PIC16F785

**FIGURE 18-9:** PIC16F785 A/D CONVERSION TIMING (NORMAL MODE)

**Note 1:** If the A/D clock source is selected as RC, a time of T$_{CY}$ is added before the A/D clock starts. This allows the SLEEP instruction to be executed.
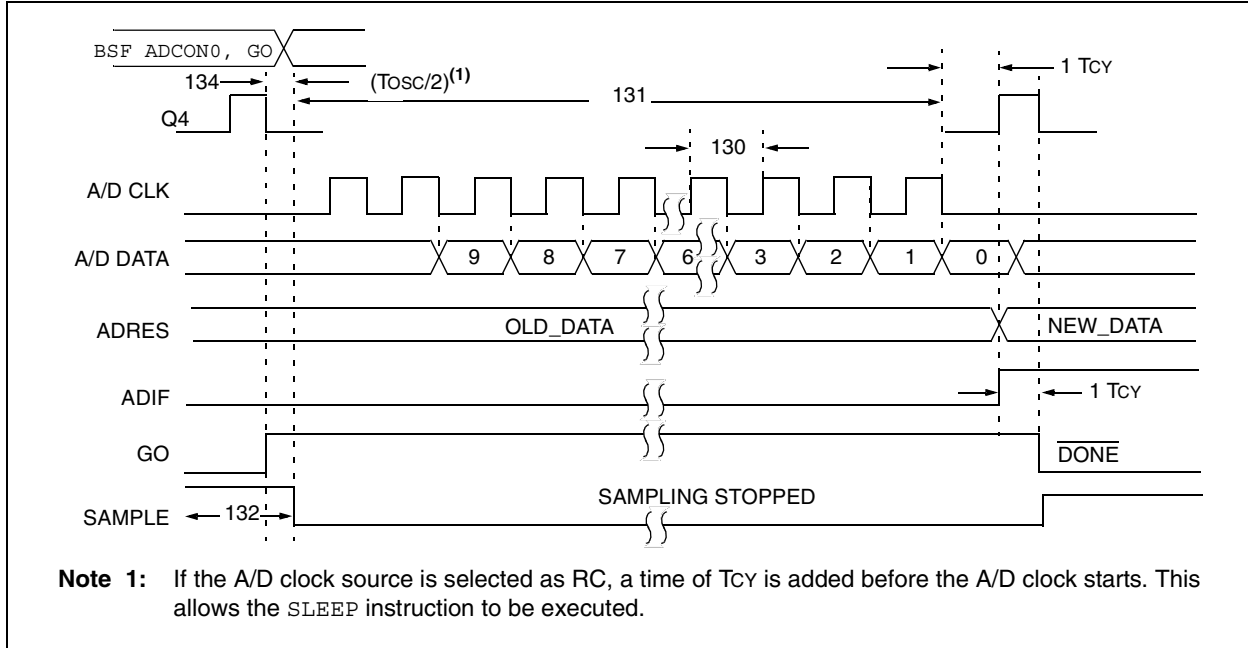

**TABLE 18-13: PIC16F785 A/D CONVERSION REQUIREMENTS**

| Param No. | Sym | Characteristic | Min | Typ† | Max | Units | Conditions |

```

| Legend: | XX...X | Customer specific information* |
|---------|--------|--------------------------------|
|         | Y      | Year code (last digit of calendar year) |
|         | YY     | Year code (last 2 digits of calendar year) |
|         | WW     | Week code (week of January 1 is week '01') |
|         | NNN    | Alphanumeric traceability code |

| **Note**: | In the event the full Microchip part number cannot be marked on one line, it will be carried over to the next line thus limiting the number of available characters for customer specific information. |
|-----------|--------|

*   Standard PICmicro device marking consists of Microchip part number, year code, week code, and traceability code. For PICmicro device marking beyond this, certain price adders apply. Please check with your Microchip Sales Office. For QTP devices, any special marking adders are included in QTP price.

## 19.2 Package Details

The following sections give the technical details of the packages.

### 20-Lead Plastic Dual In-line (P) – 300 mil Body (PDIP)

| | Units | INCHES* | | | MILLIMETERS | | |
|---|---|---|---|---|---|---|---|
| Dimension Limits | | MIN | NOM | MAX | MIN | NOM | MAX |
| Number of Pins | n | | 20 | | | 20 | |
| Pitch | p | | .100 | | | 2.54 | |
| Top to Seating Plane | A | .140 | .155 | .170 | 3.56 | 3.94 | 4.32 |
| Molded Package Thickness | A2 | .115 | .130 | .145 | 2.92 | 3.30 | 3.68 |
| Base to Seating Plane | A1 | .015 | | | 0.38 | | |
| Shoulder to Shoulder Width | E | .295 | .310 | .325 | 7.49 | 7.87 | 8.26 |
| Molded Package Width | E1 | .240 | .250 | .260 | 6.10 | 6.35 | 6.60 |
| Overall Length | D | 1.025 | 1.033 | 1.040 | 26.04 | 26.24 | 26.42 |
| Tip to Seating Plane | L | .120 | .130 | .140 | 3.05 | 3.30 | 3.56 |
| Lead Thickness | c | .008 | .012 | .015 | 0.20 | 0.29 | 0.38 |
| Upper Lead Width | B1 | .055 | .060 | .065 | 1.40 | 1.52 | 1.65 |
| Lower Lead Width | B | .014 | .018 | .022 | 0.36 | 0.46 | 0.56 |
| Overall Row Spacing § | eB | .310 | .370 | .430 | 7.87 | 9.40 | 10.92 |
| Mold Draft Angle Top | α | 5 | 10 | 15 | 5 | 10 | 15 |
| Mold Draft Angle Bottom | β | 5 | 10 | 15 | 5 | 10 | 15 |

* Controlling Parameter
§ Significant Characteristic

Notes:
Dimensions D and E1 do not include mold flash or protrusions. Mold flash or protrusions shall not exceed .010" (0.254mm) per side.
JEDEC Equivalent: MS-001
Drawing No. C04-019

## 20-Lead Plastic Small Outline (SO) – Wide, 300 mil Body (SOIC)
| | Units | INCHES* | | | MILLIMETERS | | |
|---|---|---|---|---|---|---|---|
| Dimension Limits | | MIN | NOM | MAX | MIN | NOM | MAX |
| Number of Pins | n | | 20 | | | 20 | |
| Pitch | p | | .050 | | | 1.27 | |
| Overall Height | A | .093 | .099 | .104 | 2.36 | 2.50 | 2.64 |
| Molded Package Thickness | A2 | .088 | .091 | .094 | 2.24 | 2.31 | 2.39 |
| Standoff § | A1 | .004 | .008 | .012 | 0.10 | 0.20 | 0.30 |
| Overall Width | E | .394 | .407 | .420 | 10.01 | 10.34 | 10.67 |
| Molded Package Width | E1 | .291 | .295 | .299 | 7.39 | 7.49 | 7.59 |
| Overall Length | D | .496 | .504 | .512 | 12.60 | 12.80 | 13.00 |
| Chamfer Distance | h | .010 | .020 | .029 | 0.25 | 0.50 | 0.74 |
| Foot Length | L | .016 | .033 | .050 | 0.41 | 0.84 | 1.27 |
| Foot Angle | φ | 0 | 4 | 8 | 0 | 4 | 8 |
| Lead Thickness | c | .009 | .011 | .013 | 0.23 | 0.28 | 0.33 |
| Lead Width | B | .014 | .017 | .020 | 0.36 | 0.42 | 0.51 |
| Mold Draft Angle Top | α | 0 | 12 | 15 | 0 | 12 | 15 |
| Mold Draft Angle Bottom | β | 0 | 12 | 15 | 0 | 12 | 15 |

\* Controlling Parameter
§ Significant Characteristic

Notes:
Dimensions D and E1 do not include mold flash or protrusions. Mold flash or protrusions shall not exceed
.010" (0.254mm) per side.
JEDEC Equivalent: MS-013
Drawing No. C04-094

# PIC16F785

**20-Lead Plastic Shrink Small Outline (SS) – 209 mil Body, 5.30 mm (SSOP)**

| | Units | INCHES | | | MILLIMETERS* | | |
|---|---|---|---|---|---|---|---|
| Dimension Limits | | MIN | NOM | MAX | MIN | NOM | MAX |
| Number of Pins | n | | 20 | | | 20 | |
| Pitch | p | | .026 | | | 0.65 | |
| Overall Height | A | - | - | .079 | - | - | 2.00 |
| Molded Package Thickness | A2 | .065 | .069 | .073 | 1.65 | 1.75 | 1.85 |
| Standoff | A1 | .002 | - | - | 0.05 | - | - |
| Overall Width | E | .291 | .307 | .323 | 7.40 | 7.80 | 8.20 |
| Molded Package Width | E1 | .197 | .209 | .220 | 5.00 | 5.30 | 5.60 |
| Overall Length | D | .272 | .283 | .295 | 6.90 | 7.20 | 7.50 |
| Foot Length | L | .022 | .030 | .037 | 0.55 | 0.75 | 0.95 |

## APPENDIX A: DATA SHEET REVISION HISTORY

### Revision A

This is a new data sheet.

## APPENDIX B: MIGRATING FROM OTHER PICmicro® DEVICES

This discusses some of the issues in migrating from the PIC16F684 PICmicro device to the PIC16F785.

### B.1 PIC16F684 to PIC16F785

**TABLE B-1: FEATURE COMPARISON**

| Feature | PIC16F684 | PIC16F785 |
|---|---|---|
| Max Operating Speed | 20 MHz | 20 MHz |
| Max Program Memory (Words) | 2048 | 2048 |
| SRAM (bytes) | 128 | 128 |
| A/D Resolution | 10-bit | 10-bit |
| Data EEPROM (bytes) | 256 | 256 |
| Timers (8/16-bit) | 2/1 | 2/1 |
| Oscillator modes | 8 | 8 |
| Brown-out Reset | Y | Y |
| Internal Pull-ups | RA0/1/2/4/5 MCLR | RA0/1/2/3/4/5 MCLR |
| Interrupt-on-change | RA0/1/2/3/4/5 | RA0/1/2/3/4/5 |
| Comparator | | 2 |
| CCP | ECCP | Y |
| Op Amps | N | 2 |
| PWM | N | 2 Phase |
| Ultra Low-Power Wake-up | Y | N |
| Extended WDT | Y | Y |
| Software Control Option of WDT/BOR | Y | Y |
| INTOSC Frequencies | 32 kHz - 8 MHz | 32 kHz - 8 MHz |
| Clock Switching | Y | Y |

## ON-LINE SUPPORT

Microchip provides on-line support on the Microchip World Wide Web site.

The web site is used by Microchip as a means to make files and information easily available to customers. To view the site, the user must have access to the Internet and a web browser, such as Netscape® or Microsoft® Internet Explorer. Files are also available for FTP download from our FTP site.

### Connecting to the Microchip Internet Web Site

The Microchip web site is available at the following URL:

**www.microchip.com**

The file transfer site is available by using an FTP service to connect to:

**ftp://ftp.microchip.com**

The web site and file transfer site provide a variety of services. Users may download files for the latest Development Tools, Data Sheets, Application Notes, User's Guides, Articles and Sample Programs. A variety of Microchip specific business information is also available, including listings of Microchip sales offices, distributors and factory representatives. Other data available for consideration is:

- Latest Microchip Press Releases
- Technical Support Section with Frequently Asked Questions
- Design Tips
- Device Errata
- Job Postings
- Microchip Consultant Program Member Listing
- Links to other useful web sites related to Microchip Products
- Conferences for products, Development Systems, technical information and more
- Listing of seminars and events

## SYSTEMS INFORMATION AND UPGRADE HOT LINE

The Systems Information and Upgrade Line provides system users a listing of the latest versions of all of Microchip's development systems software products. Plus, this line provides information on how customers can receive the most current upgrade kits. The Hot Line Numbers are:

1-800-755-2345 for U.S. and most of Canada, and

1-480-792-7302 for the rest of the world.

042003

**Preliminary**

## READER RESPONSE

It is our intention to provide you with the best documentation possible to ensure successful use of your Microchip product. If you wish to provide your comments on organization, clarity, subject matter, and ways in which our documentation can better serve you, please FAX your comments to the Technical Publications Manager at (480) 792-4150.

Please list the following information, and use this outline to provide us with your comments about this document.

To:     Technical Publications Manager          Total Pages Sent _____

RE:     Reader Response

From:   Name _____

        Company _____

        Address _____

        City / State / ZIP / Country _____

        Telephone: (_____) _____ - _____          FAX: (_____) _____ - _____

Application (optional):

Would you like a reply?____Y ____N

Device:  PIC16F785          Literature Number:  DS41249A

Questions:

1.  What are the best features of this document?

    _____

    _____

2.  How does this document meet your hardware and software development needs?

    _____

    _____

3.  Do you find the organization of this document easy to follow? If not, why?

    _____

    _____

4.  What additions to the document do you think would enhance the structure and subject?

    _____

    _____

5.  What deletions from the document could be made without affecting the overall usefulness?

    _____

    _____

6.  Is there any incorrect or misleading information (what and where)?

    _____

    _____

7.  How would you improve this document?

    _____

    _____

## PRODUCT IDENTIFICATION SYSTEM

To order or obtain information, e.g., on pricing or delivery, refer to the factory or the listed sales office.

| PART NO. | X | /XX | XXX |
|---|---|---|---|
| **Device** | **Temperature Range** | **Package** | **Pattern** |

| | | |
|---|---|---|
| Device | 16F: Standard V$_{DD}$ range<br>16FT: (Tape and Reel) | |
| Temperature Range | I = | -40°C to +85°C |
| | E = | -40°C to +125°C |
| Package | P = | PDIP |
| | SO = | SOIC (Gull wing, 300 mil body) |
| | SS = | SSOP(5.3 mm) |
| Pattern | 3-Digit Pattern Code for QTP (blank otherwise) | |

**Examples:**

a) PIC16F785 – E/P 301 = Extended Temp., PDIP package, 20 MHz, QTP pattern #301

b) PIC16F785 – I/SO = Industrial Temp., SOIC package, 20 MHz

## Sales and Support

**Data Sheets**

Products supported by a preliminary Data Sheet may have an errata sheet describing minor operational differences and recommended workarounds. To determine if an errata sheet exists for a particular device, please contact one of the following:

1. Your local Microchip sales office
2. The Microchip Corporate Literature Center U.S. FAX: (480) 792-7277
3. The Microchip Worldwide Site (www.microchip.com)

Please specify which device, revision of silicon and Data Sheet (include Literature #) you are using.

**New Customer Notification System**

Register on our web site (www.microchip.com/cn) to receive the most current information on our products.
