

## DUAL PRECISION CMOS VOLTAGE COMPARATOR WITH OPEN DRAIN OUTPUT DRIVER

### GENERAL DESCRIPTION

The ALD2331A/ALD2331B/ALD2331 is a monolithic high performance dual precision voltage comparator built with advanced silicon gate EPAD<sup>®</sup> CMOS technology intended for high precision analog applications. The ALD2331A/ALD2331B/ALD2331 offers ultra-low input offset voltages and currents at its input pre-amplifier, precision voltage comparator and high-current output driver integrated on-chip, in one industry standard pinout 8 Lead PDIP or SOIC package. Primary features include: very high typical input impedance of  $10^{12}\Omega$ ; low input bias current of 10pA; fast response time of 750ns with only 10mV input step signal; very low power dissipation of 55µA per comparator; and single (+5V) or dual ( $\pm 5V$ ) power supply operation; and 50mA open drain output drivers.

The input voltage range includes ground, making this comparator ideal for low level signal detection with high source impedance. The outputs are open-drain configurations, allowing maximum application flexibility, such as wired-OR connection and various different output loads. An external pull-up resistor is required for each output, although the value of the pull-up resistor can vary over a wide range in order to suit the application needs. The outputs can be connected to a higher external voltage than  $V^+$ .

The ALD2331A/ALD2331B/ALD2331 is ideal for a great variety of precision analog voltage comparator applications, especially low level signal detection circuits requiring low standby power, yet retaining high output current capability as needed.

### FEATURES

- Fanout of 30LS TTL loads
- Guaranteed to drive 200Ω loads
- Low supply current of 55µA typical
- Pinout of LM193 industry standard voltage comparators
- Extremely low input bias currents -- typically 10pA
- Virtually eliminates source impedance effects
- Low operating supply voltage of 3V to 10V
- Single (+5V) and dual supply ( $\pm 5V$ ) operation
- High speed for both large and small level signals -- 300ns typical for TTL inputs
- CMOS, NMOS and TTL compatible
- Wired-OR open drain outputs
- High output sink current -- typically 50mA
- Low supply current spike

### APPLICATIONS

- Simple precision reference voltage setting
- High source impedance voltage comparison circuits
- MOSFET driver
- Dual limit window comparator
- Power supply voltage monitor
- Photo-detector sensor circuit
- Relay or LED driver
- Oscillators
- Battery operated instruments
- Remote signal detection

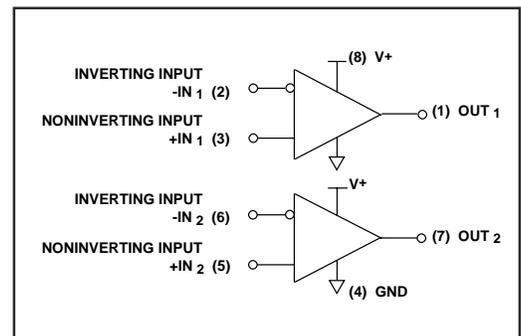

### BENEFITS

- Simple precision reference voltage setting
- On-chip input pre-amplifier and output buffers
- Precision voltage comparison without pre-amplifier
- Eliminates need for second power supply
- Wide range of pull-up resistor values

### RESPONSE TIME MEASUREMENT CIRCUIT

Response time is defined as the interval between the application of an input step function and the instant when the output reaches 50% of its maximum value as measured by the following test circuit:

**DUAL LIMIT WINDOW COMPARATOR**

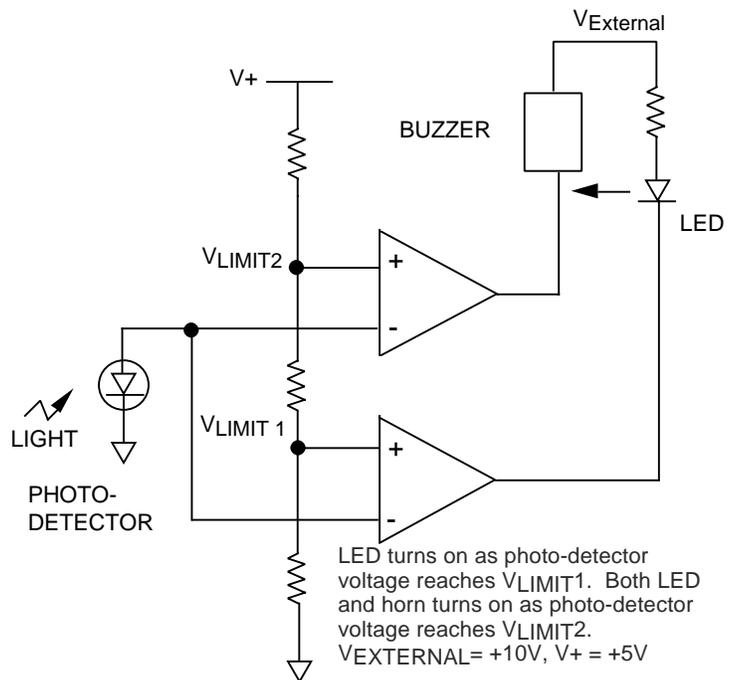

MINIMUM  $R_{LOAD} = 1.5K\Omega$

OUTPUT HIGH FOR  $V_{IN} < V_{REF(HIGH)}$

AND  $V_{IN} > V_{REF(LOW)}$

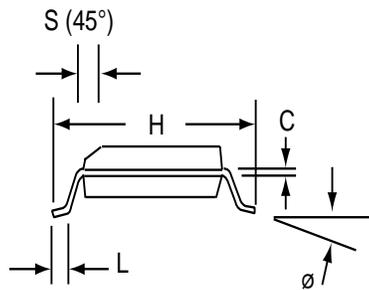

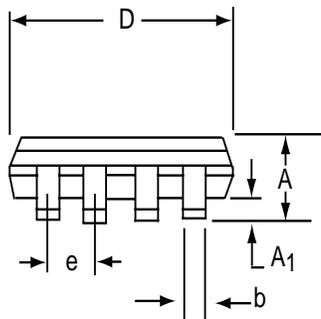

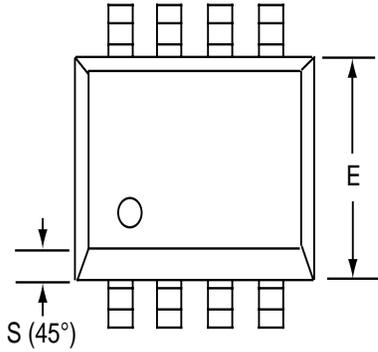

**DUAL LIMIT PHOTO DETECTOR MONITOR**

LED turns on as photo-detector voltage reaches  $V_{LIMIT1}$ . Both LED and horn turns on as photo-detector voltage reaches  $V_{LIMIT2}$ .  
 $V_{EXTERNAL} = +10V$ ,  $V+ = +5V$
