
Ultra-low current 2.4 V precision analog temperature sensor

Features

- Precision analog voltage output temperature sensor
- ± 1.5 °C maximum temperature accuracy at 25 °C (± 0.5 °C typical)
- Ultra-low quiescent supply current: 4.8 μ A (typ) and 8.0 μ A (max)
- Operating voltage range: 2.4 V to 5.5 V
- Operating temperature range:
 - 55 °C to 130 °C (grade 7)
 - 40 °C to 85 °C (grade 9)
- SOT323-5L 5-lead package
- UDFN-4L 4-lead package

Applications

- Smartphones
- Multimedia PDA devices
- GPS devices
- Portable medical instruments
- Voltage-controlled crystal oscillator temperature monitors
- RF power transistor monitor

1 Description

The STLM20 is a precision analog output temperature sensor for low current applications where maximizing battery life is important. It operates over a $-55\text{ }^{\circ}\text{C}$ to $130\text{ }^{\circ}\text{C}$ (grade 7) or $-40\text{ }^{\circ}\text{C}$ to $85\text{ }^{\circ}\text{C}$ (grade 9) temperature range. The power supply operating range is 2.4 V to 5.5 V. The maximum temperature accuracy of the STLM20 is $\pm 1.5\text{ }^{\circ}\text{C}$ ($\pm 0.5\text{ }^{\circ}\text{C}$ typ) at an ambient temperature of $25\text{ }^{\circ}\text{C}$ and V_{CC} of 2.7 V. The temperature error increases linearly and reaches a maximum of $\pm 2.5\text{ }^{\circ}\text{C}$ at the temperature range extremes. The temperature range is affected by the power supply voltage. For the temperature grade 7 device, a power supply voltage of 2.7 V to 5.5 V, the temperature range extremes are $+130\text{ }^{\circ}\text{C}$ and $-55\text{ }^{\circ}\text{C}$ (decreasing the power supply voltage from 2.7 V to 2.4 V changes the low end of the operating temperature range from $-55\text{ }^{\circ}\text{C}$ to $-30\text{ }^{\circ}\text{C}$, while the positive remains at $+130\text{ }^{\circ}\text{C}$).

The STLM20 has a maximum quiescent supply current of $8\text{ }\mu\text{A}$. Therefore, self-heating is negligible.

2 Transfer function

The STLM20's transfer function can be described in different ways, with varying levels of precision. A simple linear transfer function, with good accuracy near 25 °C is expressed as:

Equation 1 (first order linear equation)

$$V_O = (-11.69\text{mV})/^{\circ}\text{C} \times T + 1.8663\text{V}$$

Over the specified operating temperature range, the best accuracy can be obtained by using the parabolic transfer function:

Equation 2 (second order parabolic equation)

$$V_O = (-3.88 \times 10^{-6} \times T^2) + (-1.15 \times 10^{-2} \times T) + 1.8639$$

and solving for T:

$$T = -1481.96 + \sqrt{2.1962 \times 10^6 + \frac{(1.8639 - V_O)}{3.88 \times 10^{-6}}}$$

The best fit linear transfer function for many popular temperature ranges was calculated in [Table 2](#), where the error introduced by the linear transfer function increases with wider temperature ranges.

3 Maximum ratings

Stressing the device above the rating listed in the absolute maximum ratings table may cause permanent damage to the device. These are stress ratings only and operation of the device at these or any other conditions above those indicated in the operating sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

4 DC and AC characteristics

This section summarizes the DC and AC characteristics of the device. The parameters in the DC and AC characteristics table that follows are derived from tests performed under the test conditions. Designers should check that the operating conditions in their circuit match the operating conditions when relying on the quoted parameters.

- Valid for ambient operating temperature: T_A = -55 to 130 °C or T_A = -40 to 85 °C; V_{CC} = 2.7 V (except where noted).
- T_J = T_A = 25 °C, unless otherwise noted under test condition.
- Accuracy is defined as the error between the measured and calculated output voltage at specified conditions of voltage, current, and temperature.
- Positive load currents flow out of the device (sourcing) and can typically be 16 μA. For negative load currents (sinking), the device can sink less than 1 μA.
- Over the supply range of 2.4 to 5.5 V.
- Measured at constant junction temperature, with pulse testing and low duty cycle. Output changes due to heating may be calculated by multiplying internal dissipation by thermal resistance.

5 Capacitive load

The STLM20 will handle capacitive loads of up to 300 pF. Over the specified temperature range, the STLM20 has a maximum output impedance of 160 Ω .

In a noisy environment, it may be advisable to add some filtering to minimize noise in the output voltage. A 0.1 μF capacitor added between the supply voltage and ground is recommended.

In an extremely noisy environment, it may be necessary to add a low-pass filter network to the output of the device. A 1 μF capacitor, in addition to the output impedance of the device, and a 200 Ω series resistor, will provide a low-pass filter that will pass the slow thermal time constant of the STLM20, while filtering the higher frequency noise.
