

RF Manual 14th edition

Application and design manual
for High Performance RF products
May 2010

NXP

NXP's RF Manual makes design work much easier

NXP's RF Manual – one of the most important reference tools on the market for today's RF designers – features our complete range of RF products, from low to high power signal conditioning & high speed data converters.

What's new?

This RF Manual features new applications, such as: point-to-point communication, radar, VSAT, MoCA (Multimedia over Coax Alliance), NIM (Network Interface Module for TV reception), Digital Satellite Set-top-box RF (Plasma) lighting, medical imaging, microwave furnaces and Mobile platforms. And we describe thoroughly new developments in our main technologies SiGe:C QUBiC and LDMOS.

New products families have been added to our broad portfolio, like: Quad pin diodes, 6th and 7th generation SiGe:C wideband transistors, variable gain amplifiers, LNA's for wireless infrastructures, LNA's and MOSFETs for STB and a full line-up of high speed converters. And of course the latest additions and improvements are included: GPS LNA's, medium power amplifiers, LO generators and CATV modules.

Our base station offering has grown extensively by e.g. a comprehensive set of best in class Doherty amplifier designs, a broad selection of medium power, variable gain and low noise amplifiers and our JESD204A-compliant, high speed DACs and ADCs.

Last but not least, we expanded our cross reference list with 40% to over 1.200 items.

A strong foundation in RF

Shipping billions of RF products annually, NXP is a true industry leader in high performance RF. Our RF small signal products are widely installed in satellites, cellular base stations, mobile devices, cars, TV tuners and CATV. We're a leader in high power RF for cellular infrastructure, broadcast/ISM and Radar applications. With our new, serialized signal processing architectures with JESD204A-compliant high-speed converters, we are enabling a transition to more compact, higher performance systems.

Our IP extends far beyond our packaged products to our patented high performance processes. From high-power LDMOS for power amplifiers, CMOS processes for our high-speed converters, and the most advanced SiGe:C (QUBiC4) for RF small signal transistors, MMICs and ICs. Our in-house process and technology portfolio sets us apart.

What's more, producing over 65 million units per day, we control our front- and back-end manufacturing quality and cost structures with internal 8-inch IC fabs in the Netherlands and Singapore and assembly plants in Thailand, Taiwan and China. Our processes are all AEC100 certified for supply into the most quality-conscious customers and applications.

NXP's firsts in RF

- 1963 – First transistors and diodes on 0.75 inch wafers
- 1964 – First RF wideband transistor with 1.5 GHz max
- 1970 – BFR90, a 5 GHz RF wideband transistor
- 1978 – BFQ33, a 14 GHz RF wideband transistor
- 1989 – Output matching in common emitter base station transistors
- 1992 – Highest power broadcast bipolar devices
- 1996 – Highest performance 2 GHz LDMOS
- 2004 – Gen5 LDMOS which becomes the industry's most advanced process for power amplifiers
- 2006 – Fully integrated Doherty transistors
- 2007 – Industry's first fully integrated, silicon-based IC solution for satellite: TFF1004HN
- 2008 – High speed data converters based on JESD204A standard
- 2009 – 1kW single transistor (BLF578) power amplifier for FM radio (88 to 108 MHz)
- 2009 – State-of-the-art, next generation SiGe:C BiCMOS QUBiC4Xi technology

"I'm proud to present the latest edition of our RF Manual. It covers NXP's entire range of RF products in one comprehensive manual, and I'm convinced that you'll find the 14th edition even more useful in your daily design work."

Kind regards,

John Croteau

Sr. Vice President & General Manager
Business Line High Performance RF

1.1 Mobile Communication Infrastructure

1.1.1 Base stations (all cellular standards and frequencies)

See also brochure: 'Your partner in Mobile Communication Infrastructure design': document number: 9397 750 16837.

Application diagram

Above diagram shows a simplified base station block diagram with its two main branches: transmit (upper half, TX) and receive (lower half, RX).

Walking along the transmit branch, after the interfacing into the signal processing part, one first encounters the digital to analog converters (DAC), which include a serial interface in our case (SER). The transmit signal then passes a low-pass filter block (LPF) and is being upconverted in the IQ mixer stage. Next follows a variable gain amplifier (VGA), a bandpass filter (TX BPF) and the power amplifier board with a medium power amplifier- (MPA) and the high power amplifier (HPA)stages.

An isolator and duplexer are the last two basic blocks up to the antenna. A feedback line is provided to monitor the transmitted signal. The TX signal is "sampled", down-converted in a mixer, amplified (VGA), bandpassfiltered (BPF) and converted to digital by an analog to digital converter (SER ADC), with a high speed serial interface.

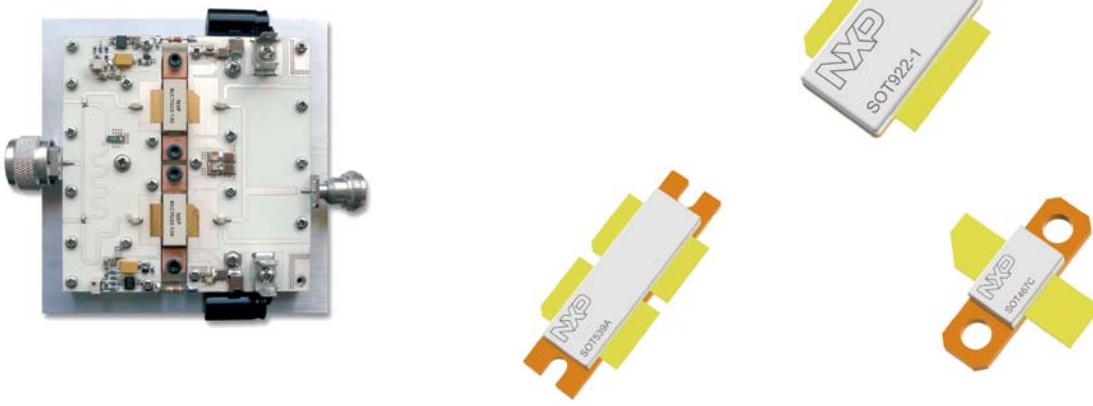

The main RX branch of the base station starts at the duplexer, is amplified by a low noise amplifier (LNA) and band pass filtered (RX BPF) very close to the antenna in a "tower mounted amplifier". A further amplifier (LNA) then feeds into the down conversion mixer; the I and Q base band signals are further amplified (VGA) and via a low pass filter (LPF) fed into the respective ADC's (SER I-ADC and SER Q-DAC).

The serial interface in turn connects to the base band signal processing unit. The synchronizing "heartbeats" in the diagram are controlled by phase locked loops (PLL) with or without a voltage controlled oscillator (VCO). Microcontrollers (μ C) provide local control and monitoring functions within the building blocks. The colored building blocks can all be sourced by NXP and are discussed in the following paragraphs.

high power transistor BLF7G20L(S)-300P

NXP's LDMOS Gen6 and Gen7 enable the world's most efficient base station designs by combining very high intrinsic (Si technology) and extrinsic (amplifier design) efficiencies. Gen7 is specifically designed for Doherty amplifiers.

Features

- unrivaled ruggedness
- very consistent device performance
- highest Doherty amplifier efficiencies to date
- 300 W peak power; 35 W average power in push pull package
- low thermal resistance design for very reliable operation

medium power amplifier BGA7124 MMIC

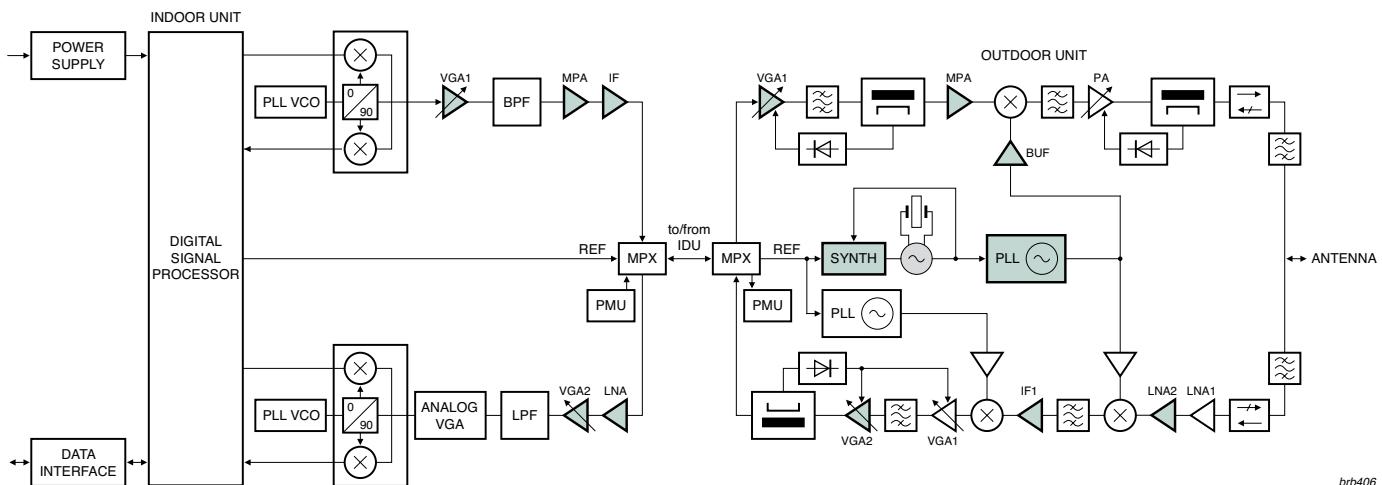

The BGA7124 MMIC is a one-stage driver amplifier, offered in a low-cost ultra small SOT908 leadless package. It delivers 25 dBm output power at 1 dB gain compression and a superior performance for various narrowband-tuned application circuits for frequencies up to 2700 MHz.

Features

- ▶ 400 MHz to 2700 MHz frequency operating range
- ▶ 16 dB small signal gain at 2 GHz
- ▶ 27 dBm output power at 1 dB gain compression
- ▶ Integrated active biasing
- ▶ 3.3 V / 5 V single supply operation
- ▶ Simple quiescent current adjustment
- ▶ 1 μ A shutdown mode

TFF1003HN

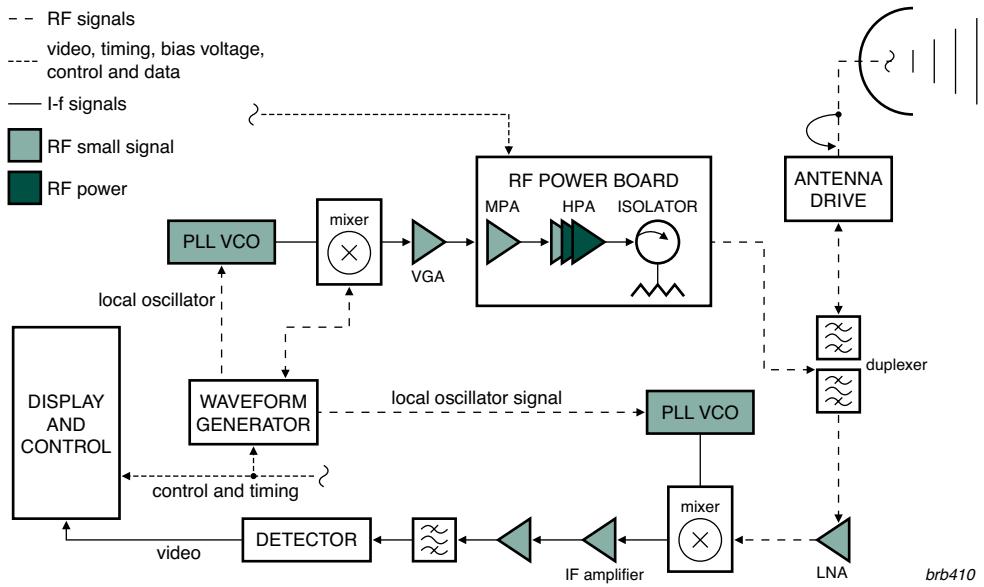

The TFF1003HN is a Ku band frequency generator intended for low phase noise Local Oscillator (LO) circuits for Ku band VSAT transmitters and transceivers. The specified phase noise complies with IESS-308 from Intelsat.

Features

- ▶ Phase noise compliant with IESS-308 (Intelsat)
- ▶ LO generator with VCO range from 12.8 GHz to 13.05 GHz
- ▶ Input signal 50 MHz to 815 MHz
- ▶ Divider settings 16, 32, 64, 128 or 256

Product highlight:

The BLS6G2933P-200 is the first LDMOS based, industry standard pallet available on the market. This pallet offers more than 40% efficiency includes the complete bias network and can be used as direct replacement for current solutions.

Features

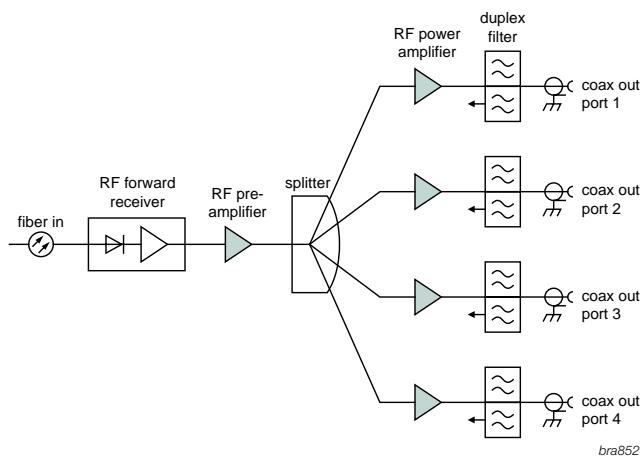

- ▶ P1 dB> 200 W
- ▶ Efficiency > 40%
- ▶ Industry standard footprint
- ▶ 50 Ω in/out matched for entire bandwidth
- ▶ Lightweight heat sink included

1.3 Fixed Communication Infrastructure

Note: looking for MoCA and Satellite Multi Switch Boxes? See chapter 1.4 TV, STB and Satellite.

Product highlight:

BGO807CE

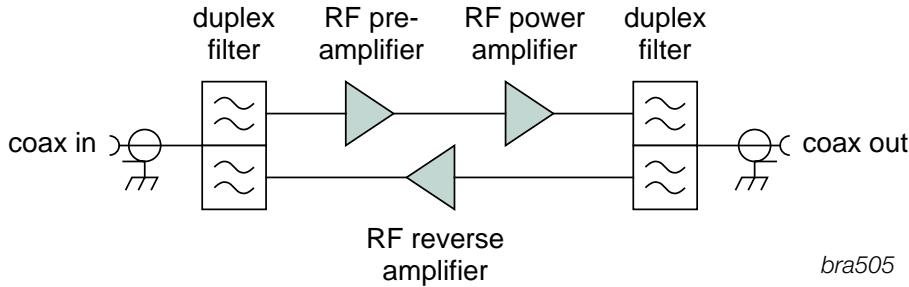

BGO807CE is an integrated optical receiver module that provides high output levels and includes an integrated temperature compensated circuitry. In your optical node design, BGO807CE enables a high performance/ price ratio and ruggedness. When upgrading an HFC network from analog to digital our BGO807CE is the perfect fit.

Features

- Excellent linearity
- Low noise
- Excellent flatness
- Standard CATV outline
- Rugged construction
- Gold metallization ensures excellent reliability
- High optical input power range

Product highlight:

CGD1046Hi

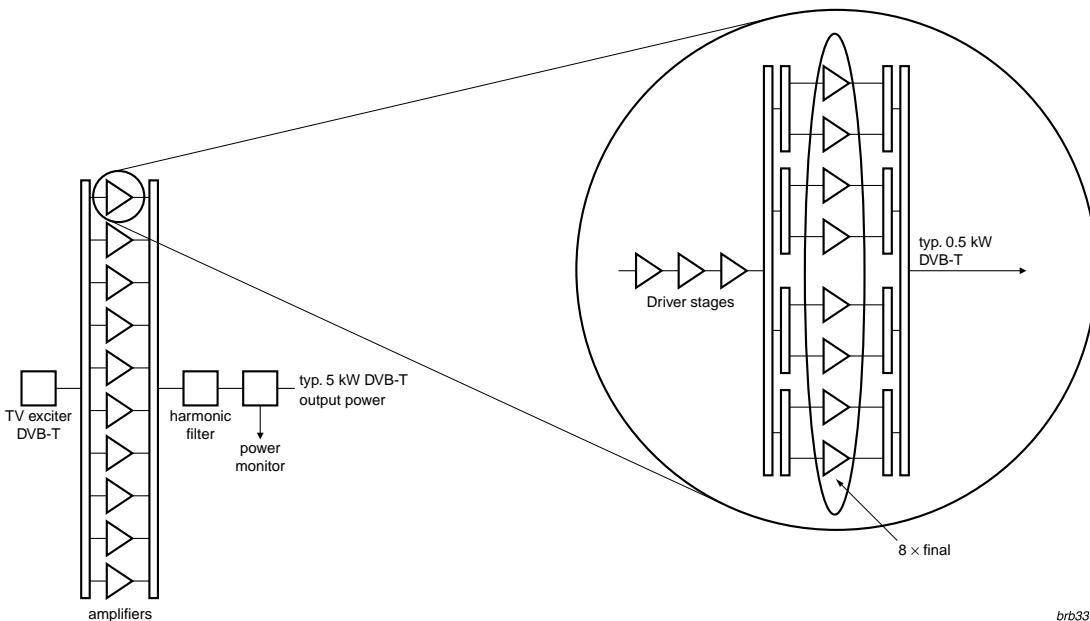

CGD1046Hi* with a very high-output power level is primarily designed for use in fiber deep-optical-node applications (N+1/2/3). This 1 GHz hybrid amplifier solution offers an extended temperature range, high power overstress capabilities in case of surges and high ESD levels resulting in a low cost of ownership. It's designed for durability and offering superior ruggedness.

Features

- ▶ High-output power
- ▶ High power gain for power doublers
- ▶ Extremely low noise
- ▶ Dark Green products
- ▶ GaAs HFET dies for high-end applications
- ▶ Rugged construction
- ▶ Superior levels of ESD protection
- ▶ Integrated ringwave protection
- ▶ Design optimized for digital channel loading
- ▶ Temperature compensated gain response
- ▶ Optimized heat management
- ▶ Excellent temperature resistance

Product highlight:

NXP's 50 V high voltage LDMOS process enables highest power and unequalled ruggedness.
BLF888A: delivers the highest power level for digital broadcasting available to date.

Features

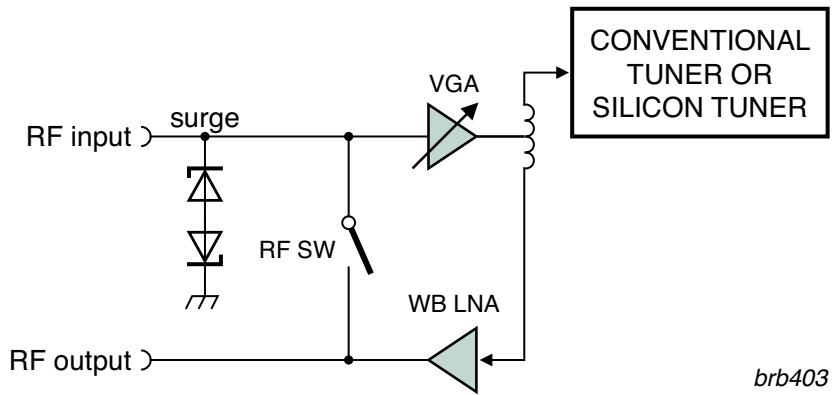

- Best broadband efficiency
- Highest power devices
- Unrivalled ruggedness
- Low-thermal resistance design for very reliable operation
- Very consistent device performance

1.4 TV, NIM (STB) and Satellite

Note: looking for TV on Mobile? See chapter 1.5.1 Handset.

1.4.1 Network interface module (NIM) for TV reception

Application diagram

Make a high performance active splitter in a NIM tuner with BGU703x.

Nowadays more flexibility in design and more complicated signal handling is required for a TV tuner. A front-end of a TV signal receiver is no longer just a tuned receiver, but has evolved into a RF Network Interface Module (NIM) with tuned demodulators, active splitters and re-modulators. The active splitter requires an LNA with excellent linearity. We have developed a new series of LNA/ VGA MMICs (BGU703x) designed specifically for high linearity (IP3O of 29 dBm) in low noise applications like an active splitter in a NIM tuner.

Save energy with BF11x8

The BF11x8 series are small signal RF switching MOSFETs which can be used for switching RF signals up to 1 GHz. With the use of the BF11x8 series as a RF switch you can save a considerable amount of energy. When a recording device (DVD-R, HDD-R, VCR, DVR) is powered off people can remain watching TV, although the antenna is looped via the recording device. Without using BF11x8 the antenna signal is lost. At the moment the power of the recording device is on, the BF11x8 is open, so the RF signal travels via the recording device to the TV tuner. At the moment the power of the recording device is completely off, the BF11x8 closes. This ensures that the RF signal is looped through directly to the TV tuner and that TV reception is guaranteed. Energy is saved because the recording device can be powered off.

Recommended products

Function	Product	Package	Type
RF Switch / PLT switch	MOSFET	5V Silicon RF switch	SOT23 BF1107
			SOT143B BF1108
			SOT143R BF1108R
			SOT343 BF1108W
			SOT343R BF1108WR
		3.3V Silicon RF Switch	SOT143B BF1118
			SOT143R BF1118R
			SOT343 BF1118W
			SOT343R BF1118WR

Note: Using the BF1108 as passive loop through switch between the RF input and output of a NIM tuner can save considerable energy. For example, when the HDR is not in used, the TV signal can still be distributed to the TV without having to power up the active splitter circuit in the HDR. That is because the BF1108 RF switch is closed when no power is supplied to it, and is open when it is powered on. For 3.3 V applications, the BF1118 can be used instead.

Function	Product	Package	Type
VGA	RF BiMOS MMIC	Wideband transistor with gain levels of 5 dB and 10 dB, plus a bypass mode.	SOT363 BGU7033*^
		Wideband transistor with gain level of 10dB and a bypass mode.	SOT363 BGU7032*^
LNA	RF bipolar transistor	Wideband transistor with gain level of 10dB	SOT363 BGU7031*^
		Wideband transistor	SOT143 BFG520
			BFG540
		SOT89	BFQ540

* = check status at 3.1 new products, as this type has not been released yet for mass production.

^ = this new series of LNA MMICs is designed specifically for high linearity (IP30 of 29 dBm), low noise application like those in an active splitter or NIM tuner. Housed in a 6-pin SOT363 plastic SMD package, these MMICs are equipped with internal bias and matched to 75 ohms internally. For the VGAs, current consumption is < 5mA during the bypass mode. Only 2 external components are needed, thus saving precious circuit board space!

Function	Product	Package	Type
AGC control amplifier	MOSFET	2 – in – 1 with band switch @ 5V	SOT363 BF1215
		2 – in – 1 @ 5V	SOT363 BF1216
		5V	SOT343 BF1217

Note: given that there is now an LNA before the MOSFET, the gain of these MOSFETs is made slightly lower and the cross-modulation higher. That way, the MOSFET would not be constantly under AGC even under nominal RF input level.

Product highlight: BF11x8 silicon RF switch, MOSFET

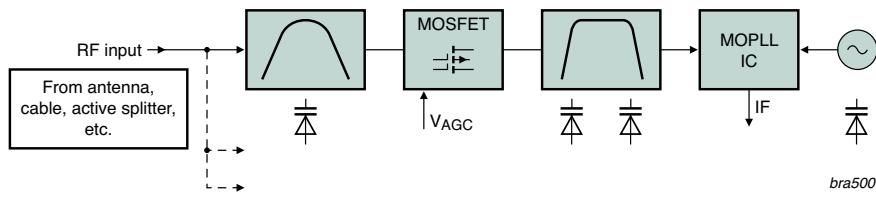

This switch is a combination of a depletion type field-effect transistor and a band switching diode in an SOT143 or SOT343 package. The low insertion loss and high isolation capabilities of this device provide excellent RF switching functions. The gate of the MOSFET can be isolated from ground with the diode, resulting in low losses. Integrated diodes between gate and source and between gate and drain protect against excessive input voltage surges.

Features

- Specially designed for low loss RF switching up to 1 GHz
- Easy to design-in
- Power ON: low losses
- Power OFF: high isolation
- ON or OFF, ZERO power consumption

Product highlight: BF1206F dual gate mosfet double amplifier specified for low power applications

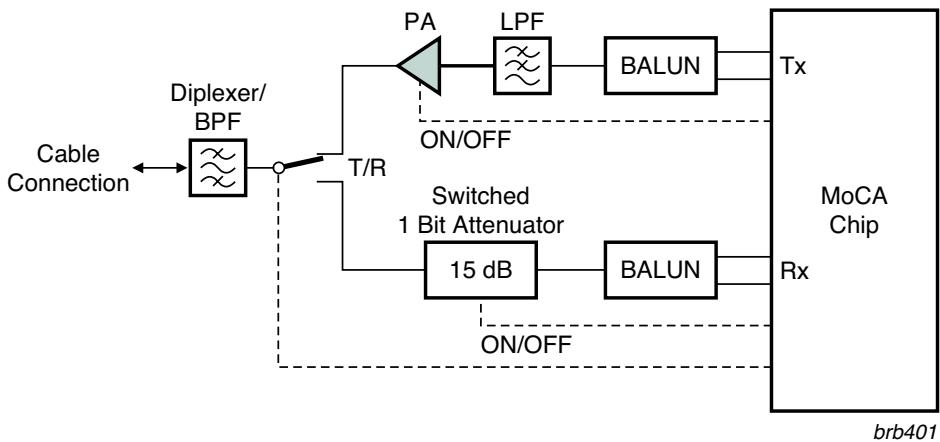

The device consists of two dual gate mosfet amplifiers in a small SOT666 flatlead package. The BF1206F is a true low power device specified for low voltage and low currents, intended for use in mobile applications where power consumption is critical. Performance is suitable for application at supply voltages of 3 Volts and draincurrents of 4 mA.

Features

- ▶ Low power specified
- ▶ Two amplifiers in one small SOT666 package
- ▶ Shared gate 2 and Source leads
- ▶ Each amplifier is biased by an external bias resistor
- ▶ Excellent noise and crossmodulation performance

medium power amplifier BGA7124 MMIC

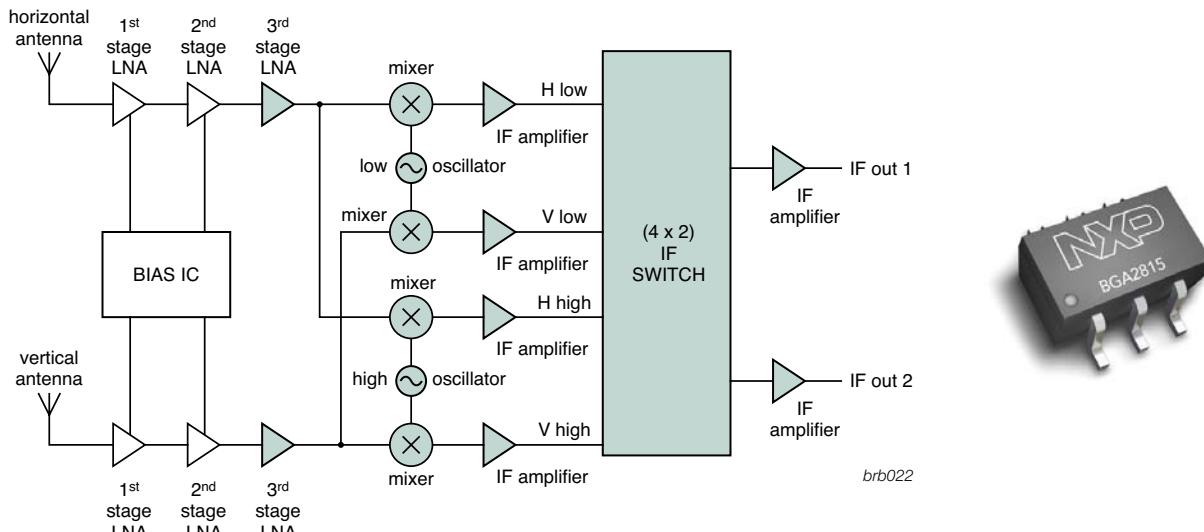

The BGA7124 MMIC is a one-stage driver amplifier, offered in a low-cost ultra small SOT908 leadless package. It delivers 25 dBm output power at 1 dB gain compression and a superior performance for various narrowband-tuned application circuits for frequencies up to 2700 MHz.

Features

- ▶ 400 MHz to 2700 MHz frequency operating range
- ▶ 16 dB small signal gain at 2 GHz
- ▶ 27 dBm output power at 1 dB gain compression
- ▶ Integrated active biasing
- ▶ 3.3 V / 5 V single supply operation
- ▶ Simple quiescent current adjustment
- ▶ 1 μ A shutdown mode

Product highlight:

PIN diodes for switching matrix

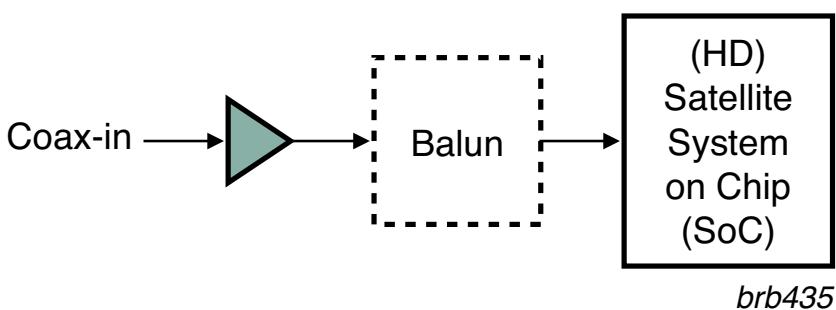

Together with outstanding RF performance, this component simplify design-in because of its extremely low forward resistance, diode capacitance and series inductance. Significant board space saving by supplying a range of high compact package options – including SOD523, SOD323 and leadless SOD882T.

Features

- ▶ High isolation, low distortion, low insertion loss
- ▶ Low forward resistance (R_d) and diode capacitance (C_d)
- ▶ Ultra-small package options

NXP's 6th and 7th generation LDMOS technology together with advanced package concepts enable best in class performing power amplifiers. The unsurpassed ruggedness and low thermal resistance in connection with the high intrinsic efficiency make these transistors ideally suited for the furnace application.

Features

- ▶ Excellent ruggedness
- ▶ Very consistent device performance
- ▶ Low thermal resistance design for unrivalled reliability
- ▶ Very easy to design with

2. Technologies & focus products

2.1 Get the fastest TTFF[^] with GPS LNAs that use proven QUBiC4X SiGe:C

[^] TTFF = Time-To-First-Fix

NXP GPS LNAs BGU7003, BGU7005, BGU7006 and BGU7007

Manufactured in NXP's breakthrough QUBiC4X SiGe:C process technology and available in the industry's smallest package, this highly integrated GPS LNAs reduce cost while delivering better sensitivity, greater immunity against jamming signals, and higher linearity.

Features

- ▶ Requires only 4 external components (including decoupling) to build complete GPS front-end.
- ▶ Requires only one external matching component
- ▶ Low current consumption (5 mA)
- ▶ Low noise figure (NF): 0.8 - 0.9 dB at 1.575 GHz
- ▶ Low current consumption in power-down mode (<1 µA)
- ▶ ESD protection on all pins
- ▶ Supply voltage: max 2.85 V, optimized for 1.8 V
- ▶ Proven, robust QUBiC4X SiGe:C process technology
(f_T = 110 GHz)

These LNAs designed for GPS receiver applications, are produced in NXP's industry-leading QUBiC4X process, a 0.25-µm SiGe:C technology. They have very low noise figures and superior linearity performance, so they help to improve overall sensitivity, which in turn leads to faster Time-To-First-Fix (TTFF) and better tracking.

The proven QUBiC4X process improves overall RF performance and means the LNAs are less expensive and offer higher, more flexible performance than their GaAs counterparts.

They restore sensitivity, provide greater immunity against out-of-band cellular signals, reduce filtering requirements, and lower overall cost. They can be placed close to the GPS antenna, minimizing the noise figure. Additional gain amplifies the GPS signal and raises the on-board signal-to-jammer ratio.

The GPS receiver can be put close to the primary phone antenna, for the best GSM/UMTS performance, while the GPS antenna can be placed far away. This improves antenna-to-antenna isolation and results in higher performance.

2.2 Always the right match with our latest 6th and 7th generation SiGe:C wideband transistors

Meet the trend towards higher frequencies. With NXP Semiconductors' latest SiGe:C microwave NPN transistors, you get high switching frequencies plus extremely high gain and low noise. All this in an easy-to-use SOT343F package. It's the ideal solution for applications up to 30 GHz.

Benefits

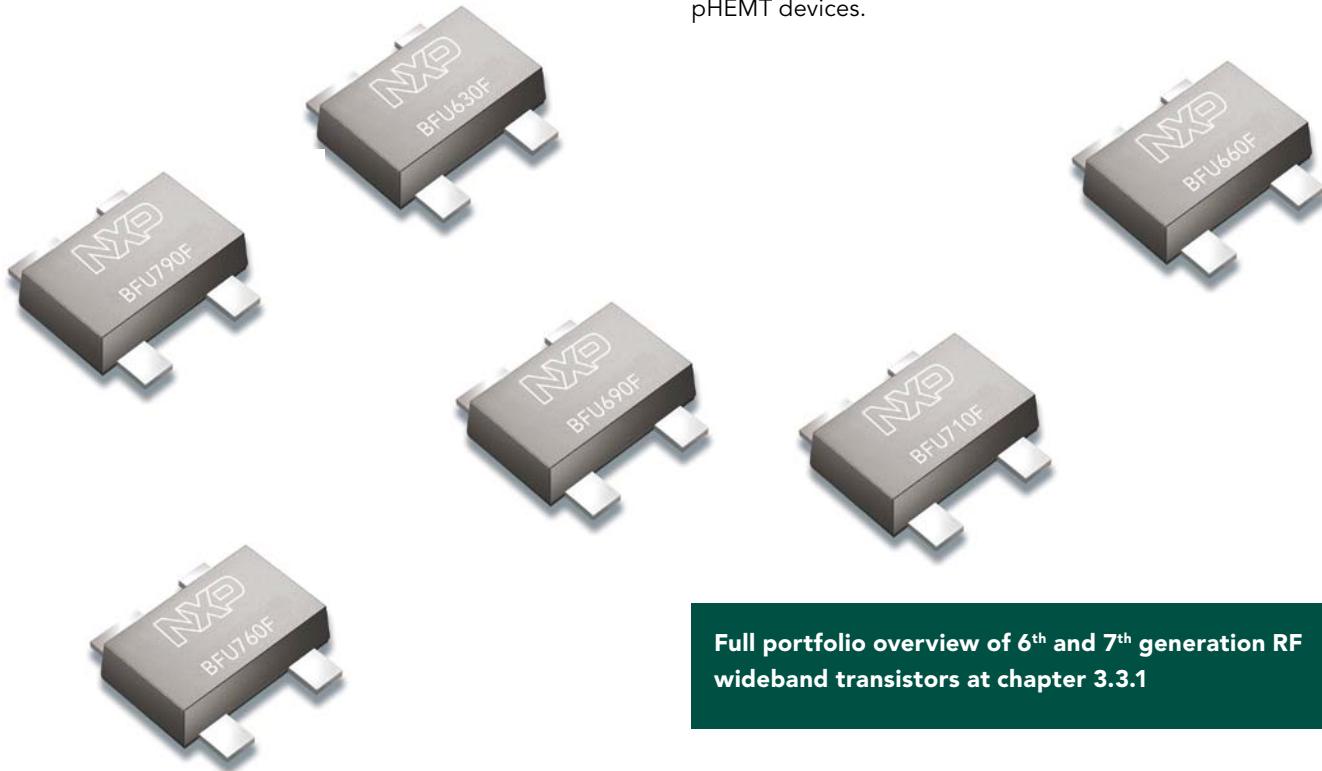

- ▶ Plastic surface-mount SOT343F package
- ▶ SiGe:C process delivers high switching frequency from a silicon-based device
- ▶ Cost-effective alternative to GaAs devices
- ▶ RoHS compliant

Applications

- ▶ Low noise amplifier (LNA) for microwave communications systems
- ▶ 2nd stage LNA and mixer in direct broadcast satellite (DBS) low-noise blocks (LNBs)
- ▶ GPS systems
- ▶ Satellite radio
- ▶ WLAN/WiMAX and CDMA applications, LTE
- ▶ DVB, CMMB

The NPN microwave transistors deliver an unbeatable blend of high switching frequency, high gain and very low noise. Thanks to the ultra-low noise figures, they are perfect for your sensitive RF receivers particularly those for high-performance cell phones. Alternatively, with the high cut-off frequencies, they are your ideal solution for microwave applications in the 10 GHz to 30 GHz range, such as satellite TV receivers and automotive collision avoidance radar.

These new 6th and 7th generation SiGe:C wideband transistors get their outstanding performance from our innovative silicon-germanium-carbon (SiGe:C) BiCMOS process. QUBiC4X was designed specifically to meet the needs of real-life, high-frequency applications and delivers an unrivalled fusion of high power gain and excellent dynamic range. It combines the performance of gallium-arsenide (GaAs) technologies with the reliability of a silicon-based process. In addition, with these transistors, you don't need a biasing IC or negative biasing voltage. So it's a much more cost-effective solution than GaAs pHEMT devices.

Full portfolio overview of 6th and 7th generation RF wideband transistors at chapter 3.3.1

2.3 NXP Medium-Power MMICs BGA7xxx for broadband applications

Broadband QUBiC4 MMICs for all 400-2700 MHz applications

Produced in NXP's proven QUBiC4 Si BiCMOS process, these MMICs bring improved thermal performance and added-value features to all 400-2700 MHz applications – at a lower cost than GaAs versions.

Features

- ▶ ESD protection at all pins
- ▶ Single-supply operation (3.3 or 5 V)
- ▶ Integrated active biasing
- ▶ Fast shutdown
- ▶ Quiescent current adjustment
- ▶ Two package options, smallest leadless package (3 x 3 mm) and leaded SOT-89

Applications

- ▶ Wireless infrastructure (base station, repeater)
- ▶ eMetering
- ▶ Broadband CPE (MoCA)
- ▶ Satellite Master Antenna TV (SMATV)
- ▶ Industrial applications
- ▶ W-LAN / ISM / RFID

Manufactured in NXP's breakthrough QUBiC4 process, these MMICs deliver a comparable level of RF performance as their GaAs equivalents, but at a lower cost and with additional features, like thermal performance and ESD robustness. The QUBiC4 process makes it possible to support even more features, including active biasing, quiescent adjustment, VGA interfaces, and a power-saving shutdown mode. To increase design flexibility, all the MMICs support single-supply (3.3/5 V) operation. And, to save space, they are available in the smallest package size (3 x 3 mm) and with leadless options.

MoCA

These MMICs are exceptionally well-suited for use a MoCA (Multimedia over Cable Alliance) PA in both the STB and in PC dongles. The MMICs offer the system designer the ability to

tailor gain or P1dB for specific platform requirements. Between 475-625 MHz and 1.15-1.5 GHz gain flatness is unrivalled. NXP Medium Power MMICs operate at low current consumption and offer a fast shut-down function to save as much power as possible. With ESD protection, active biasing and SOT89 package availability, design-in is simplified and requires a minimum of external components.

Base station

The high power level of these MMICs makes them an excellent choice for mobile-infrastructure applications. They offer the highest gain overall all base stations frequencies. The quiescent-current feature allows for high efficiency and linearity in Class-AB operation. The bias circuitry delivers a stable performance over temperature and supply variations. The integrated shutdown function is a power-saving feature and can be used for fast shutdown. The MMICs can be tuned for any band between VHF and 2.7 GHz. Unbeatable thermal performance (30 °C/W) improves overall quality and reliability.

eMetering

These MMICs are also very well suited to eMetering applications in the 900-2400 MHz ISM band. High integration and single-supply operation mean that the MMICs can be combined with just a few other components to create a full-featured solution. The MMICs can be operated on battery power (with an energy-saving shutdown mode) and are tunable between Class A and AB. They can also work on a power-line network, so they support gas metering with or without a power connection. The built-in reliability and quality of a silicon-based process provides longevity, as does the improved ESD performance.

The specifications of the BGA7130 and BGA7133 are target specifications until development is completed.

* = check status at 3.1 new products, as this type has not been released yet for mass production.

2.4 Low-noise LO generators for microwave & mmWave radios

NXP LO generators (integrated VCO/PLL) TFF11xxxHN

Manufactured in NXP's breakthrough QUBiC4X SiGe:C process technology, these highly integrated, alignment-free LO generators are low power consumption and low-spurious solutions that simplify design-in and lower the total cost of ownership.

Features

- ▶ TFF11xxxHN family: Lowest noise LO generators for a full family in range 7 to 15 GHz
- ▶ Maximum power consumption for all types, typical 330 mW
- ▶ Phase-noise compliant with IESS-308 (Intelsat)
- ▶ Proven QUBiC4X SiGe:C technology (120-GHz f_T process)
- ▶ External loop filter
- ▶ Differential input and output
- ▶ Lock-detect output
- ▶ Internally stabilized voltage reference for loop filter
- ▶ 24-pin HVQFN (SOT616-1) package

Applications: TFF11xxxHN family

- ▶ Industrial/Medical Test and Measurement Equipment
- ▶ Electronic Warfare (EW)
- ▶ Electronic Countermeasures (ECM)
- ▶ Point to Point
- ▶ Point to Multi-Point
- ▶ Satellite Communication

These low-noise local-oscillator (LO) generators, optimized for use in many different microwave applications between 7 and 15 GHz, deliver highly accurate performance in a small footprint. They require no alignment or frequency modification on the production line, so they simplify manufacturing. High integration saves board space and makes design-in easier, for lower overall cost and faster development, enabling quick time-to-market.

Since these ICs are manufactured in NXP's industry-leading QUBiC4X SiGe:C process, they offer better overall RF performance, are more robust than their GaAs equivalents, and consume much less power. The process technology also enables higher integration, for added features. NXP owns the industrial base for production (wafer fab, test, assembly), so volume supplies can be assured.

The TFF1003HN is the basis for the entire family of LO generators. It has VCO coverage of 12.8 to 13.05 GHz and accepts input signals from 50 to 816 MHz. The divider can be set for 16, 32, 64, 128, or 256, and the output level is -5 dBm with a stability of ± 2 dB. The family of LO generators is completed by a range of 18 different devices operating in a center frequency ranging from 7 to 15 GHz. The RF performance of all these devices is consistent with the TFF1003HN.

All the LO generators have very low power dissipation typical 330 mW, and all are available in a space-saving 24-pin HVQFN package.

Full portfolio overview of low noise LO generators for general microwave applications at chapter 3.4.2

2.5 Complete satellite portfolio for all LNB architectures

NXP satellite LNB devices BFU725F/N1 and BGA28xx

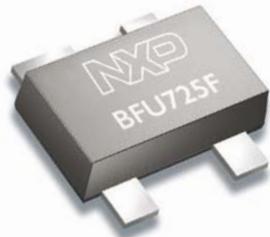

Designed for use in LNAs, mixers, and IF amplifiers, these robust, small-footprint products are manufactured in NXP's groundbreaking QUBiC4X SiGe:C and QUBiC4+ process technology and are the latest additions to NXP's leading portfolio for satellite LNB.

BFU725F/N1 RF transistor

The BFU725F/N1 is a RF transistor that can be used in the LNA part and as a mixer for a DBS LNB. In either application, it delivers low power consumption, good noise and linearity, and the lowest cost compared to GaAs pHEMT solution.

BFU725F/N1 as mixer in Ku-band LNB

- ▶ Power consumption: 2 mA at 5 V
- ▶ Single supply: 3, 5, or 6 V
- ▶ Noise, Single Side Band: 7 dB (including BPF)
- ▶ Linearity: better than 0 dBm OIP3
- ▶ Gain, SSB: 2 dB (including BPF)
- ▶ RF/LO/IF Match: better than 12/15/18 dB
- ▶ Broadband unconditionally stable
- ▶ LO-RF isolation better than 18 dB

BFU725F/N1 as 2nd or 3rd stage LNA in Ku-band LNB

- ▶ Power consumption: 11 mA at 5 V
- ▶ Single supply: 3, 5, or 6 V
- ▶ Noise, SSB: typically 1.3 dB
- ▶ Linearity: better than 10 dBm OIP3
- ▶ Gain, SSB: typically 10.5 dB
- ▶ In/Out match: better than 7/12 dB
- ▶ Broadband unconditionally stable

BFU725F/N1 as LNA for C-band LNB

- ▶ Power consumption: 7 mA at 5 V
- ▶ Single supply: 5 or 6 V
- ▶ Noise: 0.65 dB
- ▶ Linearity: better than 10 dBm OIP3
- ▶ Gain: 15 dB
- ▶ In/Out Match: better than 10 dB
- ▶ Broadband unconditionally stable

BGA28xx MMICs as IF amplifiers (1st stage & output stage)

For compatibility with existing designs, the series uses a market standard package, the SOT363 and the pin-compliant SOT363F package. The pinning is identical to NXP's current gain block family, and the blocks deliver similar noise figures. New features include flatter gain, a gain slope of 0.5 dB, improved P_{1dB} vs. I_{cc} , and no necessity of an output inductor (also not at high P_{1dB} models).

- ▶ Internally matched at 50 Ω
- ▶ Gain slope 0.5 dB
- ▶ Single supply current
 - At 3.3 V or 5 V
- ▶ Reverse isolation: >30 dB up to 2 GHz
- ▶ Best-in-class linearity vs current consumption
- ▶ Noise figure: 4 to 6 dB at 1 GHz
- ▶ Unconditionally stable ($K > 1$)
- ▶ High compression point models work without output inductor
- ▶ 6-pin SOT363 plastic SMD package

These products – the BFU725F/N1 transistor for LNA and mixer applications, and the BGA28xx series of MMICs for IF amplifiers – are the most recent additions to NXP's

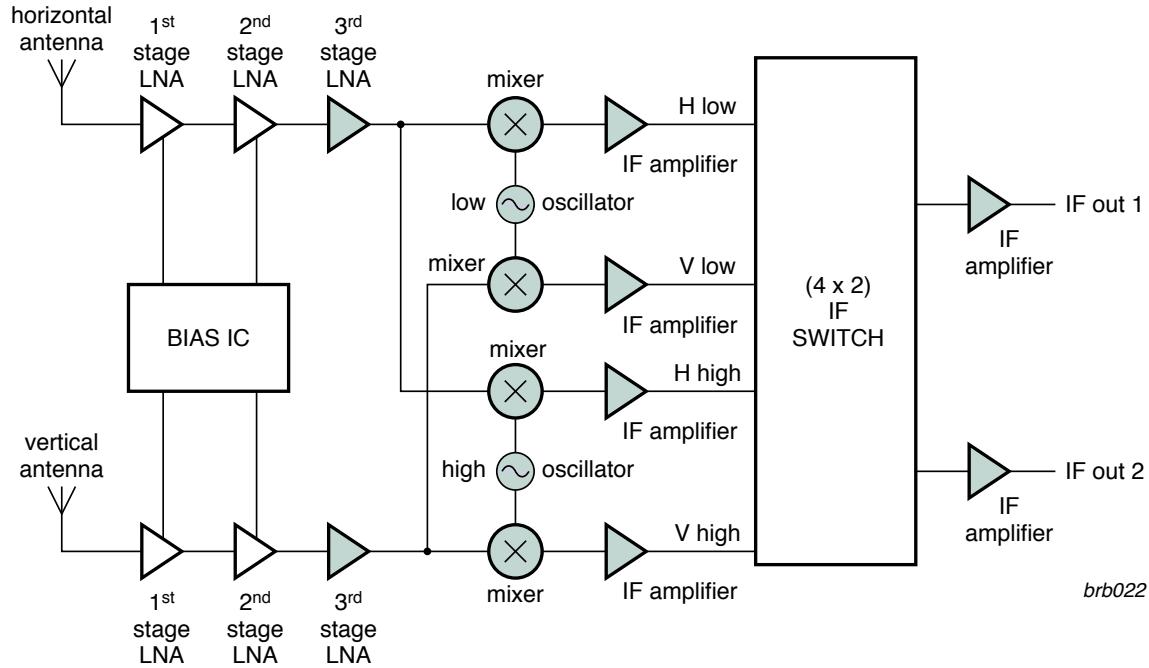

leading portfolio for satellite LNB. They join the other discrete products, including oscillators, amplifiers, switches, and biasing, to provide complete coverage for all LNB architectures.

Since the transistor and the MMICs are manufactured in NXP's industry-leading QUBiC4X SiGe:C and QuBiC4+ process,

they offer better overall RF performance and are more robust than their GaAs equivalents for the lowest cost. The process technology also enables higher integration, for added features. NXP owns the industrial base for production (wafer fab, test, assembly), so volume supplies can be assured.

Satellite outdoor unit, LNB for multiple users

NOTE: Also look at chapter 1.4.4 satellite outdoor unit.

No output inductor necessary when using the new BGA28xx IF Gain blocks at the output stage.

2.6 VSAT, 2-way communication via satellite

Design a Ku-band VSAT transmitter or transceiver that meets IESS-308

NXP Ku-band RF LO Generator IC's for VSAT

The TFF100xHN family are Ku-band RF PLLs, with integrated VCO intended for low phase-noise Local Oscillator (LO) circuits in Ku-band VSAT transmitters and transceivers. Manufactured in a high-performance SiGe:C process, it delivers extremely low phase noise and complies with the IESS-308 from Intelsat.

VSAT networks are commonly used to transmit narrowband data, such as point-of-sale transactions for credit cards, or to transmit broadband data that supports satellite Internet access to a remote location, VoIP, or video.

The network typically consists of a dish antenna, an outdoor unit, and an indoor unit. The outdoor unit is used for frequency translation between RF and IF, and usually includes a microwave-based uplink/downlink separator, a Low Noise Block (LNB) for receiving the downlink signals, and a Block Up Converter (BUC).

The VSAT IC's can be used to create the LO generator for a linear BUC (meaning the IF or RF conversion is done by mixing with an LO).

To enable precise frequency and time multiplexing, the downlink signal provides an accurate frequency reference of 10 MHz. The indoor unit frequency multiplexes this with the uplink IF signal, and the LO signal in the BUC needs to be frequency locked to the reference.

The TFF100xHN IC's are housed in a 24-pin HVQFN (SOT616-1) package. The pins have been assigned for optimal performance. Three voltage domains are used to separate the block on the IC, and two pins for each output (OUT-P) and OUT-N) have been reserved to match a typical layout using a linewidth of $Z = 50 \Omega$ microstrip on a 20-mil RO4003 board (1.1 mm).

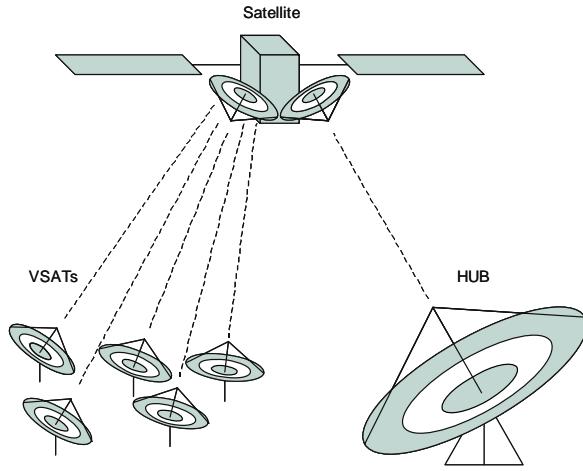

The ground pins have been placed next to the reference input and the output, and, to minimize crossings in the application, all the supply pins are on the same side of the IC.

Features

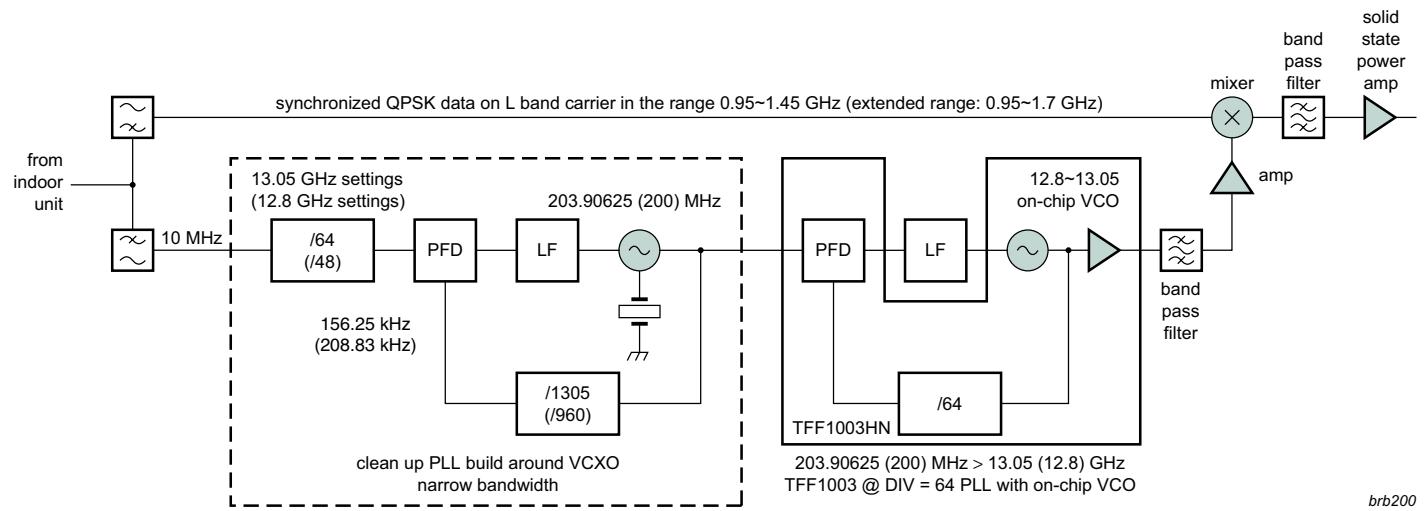

- ▶ Phase noise compliant with IESS-308 (Intelsat)
- ▶ Differential input and output
- ▶ Divider settings at 16, 32, 64, 128 or 256
- ▶ Lock-detect output
- ▶ SiGe:C technology (120-GHz f_T process)
- ▶ HVQFN24 (SOT616-1) package

Applications

- ▶ VSAT block-up-converters
- ▶ VSAT down conversion
- ▶ Local oscillator signal generation

Typical VSAT network

2.7 NXP CATV C-family for the Chinese SARFT standard

Connecting people, protecting your network

Specially designed for the Chinese Hybrid Fiber Coax (HFC) infrastructure, NXP CATV C-family offers you a total solution for cable TV networks. It is both flexible enough for connecting rural communities as part of China's 'Connecting every village' program and powerful enough for upgrading major cities from analog to high-end digital services. All C-type devices are compliant with the Chinese State Administration for Radio, Film and Television (SARFT) standard, and cover most HFC applications in the 550 - 870 MHz range.

Products

- ▶ BGY588C, BGE788C, CGY888C and BGY835C push-pull amplifiers
- ▶ BGD712C, CGD944C and CGD942C power doublers
- ▶ BGO807C and BGO807CE optical receiver

Features

- ▶ Excellent linearity, stability and reliability
- ▶ High power gain
- ▶ Extremely low noise
- ▶ Silicon Nitride passivity
- ▶ GaAs HFET dies for high end devices

Benefits

- ▶ Compliant with Chinese SARFT HFC networks standard
- ▶ Transparent cap allows confirmation of product authenticity
- ▶ Rugged construction

Further extending our high quality CATV portfolio, this new family lets you address an even wider range of HFC applications. Dedicated solutions for the implementation of CATV systems in China, our C-type devices deliver the performance you need for modern TV infrastructures.

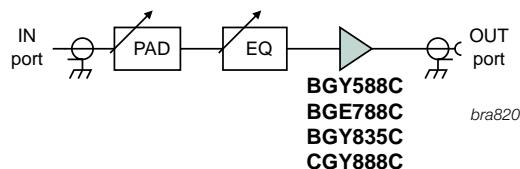

The BGY588C, BGE788C and BGD712C devices cover the frequency range from 550 MHz to 750 MHz. Extending the C-family portfolio into the high-end segment, the CGD944C, CGD942C, CGY888C and BGO807C operate between 40 MHz and 870 MHz and have been specifically tested under Chinese raster conditions. Manufactured using our GaAs HFET die process, the CGD942C, and CGD944C are high-gain, high-performance 870 MHz power doublers. They are capable of satisfying the demanding requirements of top-end applications including high-power optical nodes.

Our GaAs HFET MMIC dies are providing 'by design' the best ESD protection levels with no needs for external TVS components normally used with GaAs pHEMT devices.

All CATV C-type devices feature a see-through cap that makes it easy to distinguish them from counterfeit products.

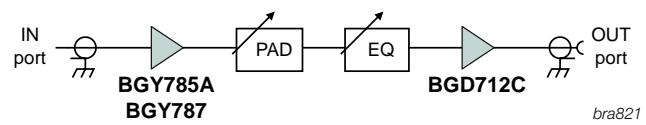

BGY588C, BGE788C, CGY888C and BGY835C

The last stage of an HFC network structure is called a terminating amplifier or 'user amplifier' as it is close to the subscribers. Each terminating amplifier requires a single module such as BGY588C for 550 MHz, BGE788C for 750 MHz and CGY888C for 860 MHz systems. These modules are fitting perfectly in the Chinese 'Connecting to Every Village' projects.

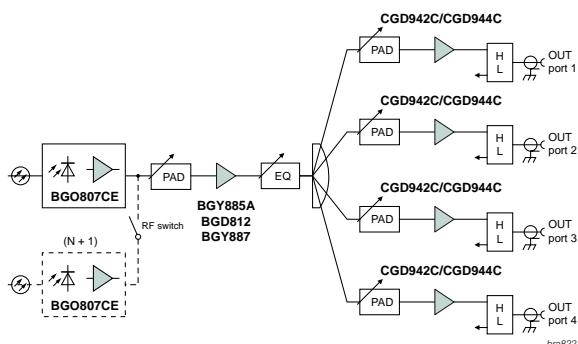

BGD712C

The BGD712C is a 750 MHz, 18 dB power doubler module. It has been designed for 750 MHz optical nodes including ordinary or optical receivers and distribution amplifiers. It can also be used in line extender amplifiers together with a 750 MHz push-pull module, such as BGY785A or BGY787. As such it can be used widely in Chinese 'Connecting to Every Village' projects.

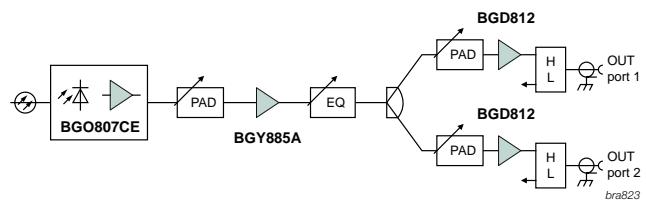

CGD942C and CGD944C

Our full GaAs power doublers modules, CGD942C and CGD944C offer high output power and better CTB and CSO than other modules. Designed for high-end HFC networks containing optical nodes with multiple out-ports, these modules enable each port to directly cover at least 125 subscribers. These two devices are ideal when used in upgrading HFC networks to 860 MHz.

BGO807CE

BGO807CE is an integrated optical receiver module that provides high output levels and includes an integrated temperature compensated circuitry. In your optical node design, BGO807CE enables a high performance/ price ratio and ruggedness. When upgrading an HFC network from analog to digital our BGO807CE is the perfect fit.

2.7.1 NXP GaAs HFC CATV solutions CGY888C, CGD942C and CGD944C

Complete GaAs amplifier solutions for Chinese HFC networks

These high-performance GaAs solutions, specially designed for the Chinese SARFT HFC standard, provide complete functionality in a format that reduces chip-count and lowers overall cost.

Products

- ▶ 870-MHz push-pull amplifier: CGY888C
- ▶ 870-MHz power doublers: CGD942C (23-dB gain),
CGD944C (25-dB gain)

Features

- ▶ GaAs HFET process for best performance and lowest chip-count
- ▶ Excellent linearity, stability, and reliability
- ▶ High power gain
- ▶ Extremely low noise
- ▶ Excellent return-loss properties

Benefits

- ▶ Fully compliant with Chinese SARFT HFC networks standard
- ▶ Transparent cap confirms product authenticity
- ▶ Rugged construction
- ▶ Unconditionally stable
- ▶ Thermally optimized design

Applications

- ▶ Hybrid Fiber Coax (HFC) applications
- ▶ Line extenders
- ▶ Trunk amplifiers
- ▶ Fiber deep-optical-node (N+0/1/2)

To support Chinese HFC CATV infrastructure applications as a single-source supplier, NXP offers the C-family, a complete line of dedicated RF amplifier modules that deliver the very high level of performance required for next-generation HFC TV networks.

The family includes the 870-MHz push-pull amplifier CGY888C, a GaAs upgrade of NXP's industry-leading BGY888 and BGY835C products, and two 870-MHz power doublers: the CGD942C, which has a typical gain of 23 dB, and the CGD944C, with a typical gain of 25 dB.

The modules are flexible enough to connect rural communities as part of China's 'Connect Every Village' project, and powerful enough to upgrade major cities from analog to high-end digital services.

The modules have been tested under Chinese raster conditions and fully comply with the Chinese SRAFT standard. They also cover most HFC applications in the range of 550 to 870 MHz and are compatible with previous generations of NXP HFC solutions, so they can be used to upgrade existing networks to a higher level of performance.

Produced in NXP's advanced GaAs HFET die process, the modules deliver excellent linearity with extremely low noise, and work seamlessly together. The GaAs process improves performance and, by reducing chip count, saves overall cost. It offers stronger signal strength than Si, so there are fewer amplifiers required, and it provides superior ESD protection compared to GaAs pHEMT processes, so there's no need for external TVS components. The CGY888C is well suited for use in the last stage of an HFC network, which is known as a terminating amplifier or a user amplifier since it is close to subscribers.

The CGD942C and the CGD944C offer higher output power and better CTB and CSO than other power doublers, so they are ideal for use in HFC networks that have optical nodes with multiple out-ports. The modules enable each port to cover at least 125 subscribers directly.

All the C-family modules are delivered with transparent caps that make it easy to distinguish them from counterfeit products.

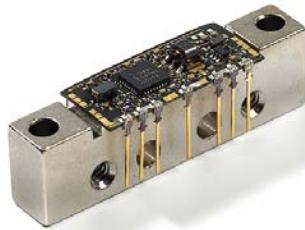

Unmatched new ESD protection levels:

All new standard NXP CATV SOT115 hybrids, power doublers or push pulls, released in 2009 and onwards will have a build-in extra protection on top of the existing one for very high level ESD surges. Those surge levels will leave our devices without any damage or destruction. Human body or biased ESD levels will increase respectively to 2000 V and 1500 V which is making now NXP CATV devices the most ESD robust product on the market today.

2.8 Highly efficient line-up of 1 GHz GaAs modules for sustainable CATV networks

NXP high-gain power doublers CGD104xHi and push-pulls CGY104x

Designed for 1-GHz “sustainable networks,” these high-performance GaAs devices enable extended bandwidth and higher data rates. They deliver increased network capacity and make way for high-end services like HDTV, VoIP, and digital simulcasting.

Key features

- ▶ Excellent linearity, stability, and reliability
- ▶ High power gain for power doublers
- ▶ Extremely low noise
- ▶ Dark Green products
- ▶ GaAs HFET dies for high-end applications
- ▶ Rugged construction
- ▶ Superior levels of ESD protection
- ▶ Integrated ringwave protection
- ▶ Design optimized for digital channel loading
- ▶ Temperature compensated gain response
- ▶ Optimized heat management
- ▶ Excellent temperature resistance

Key benefits

- ▶ Simple upgrade to 1-GHz capable networks
- ▶ Low total cost of ownership
- ▶ High power-stress capability
- ▶ Highly automated assembly

Key applications

- ▶ Hybrid Fiber Coax (HFC) applications
- ▶ Line extenders
- ▶ Trunk amplifiers
- ▶ Fiber deep-optical-node (N+0/1/2)
- ▶ Bridgers

New CATV GaAs platform lay-out

The NXP power doublers CGD104xH and CGD104xHi are ideal for use in line extenders and trunk amplifiers. They support fiber deep-optical-node applications (N+0/1/2), delivering the highest output power on the market today. The GaAs HFET die process delivers high gain, excellent CTB and CSO ratings, along with lower current.

The new NXP CGY1047x push-pull family is the first line-up on the market combining very low noise, best-in-class distortion parameters, and low “carbon footprint” capabilities. It delivers the best performance for the lowest power consumption, so it reduces OPEX and CO₂ emissions.

All of NXP’s 1-GHz solutions are designed for durability and offer superior ruggedness, an extended temperature range, high power overstress capabilities, and extremely high ESD levels. As a result, they also reduce the cost of ownership.

The GaAs die is inserted in a HVQFN package that is then mounted on thermal vias that manage heat transfer to the heat sink. Temperature-control circuitry keeps the module’s high performance stable over a wide range of temperature. Assembly is fully automated and requires almost no human intervention, so repeatability remains very high.

Upcoming products

Additional push-pulls, currently under development, will extend the capabilities of the power doublers even further, supporting almost all modern HFC applications. The push-pull CGY1041 will deliver a gain of 21 dB, the CGY1043 a gain of

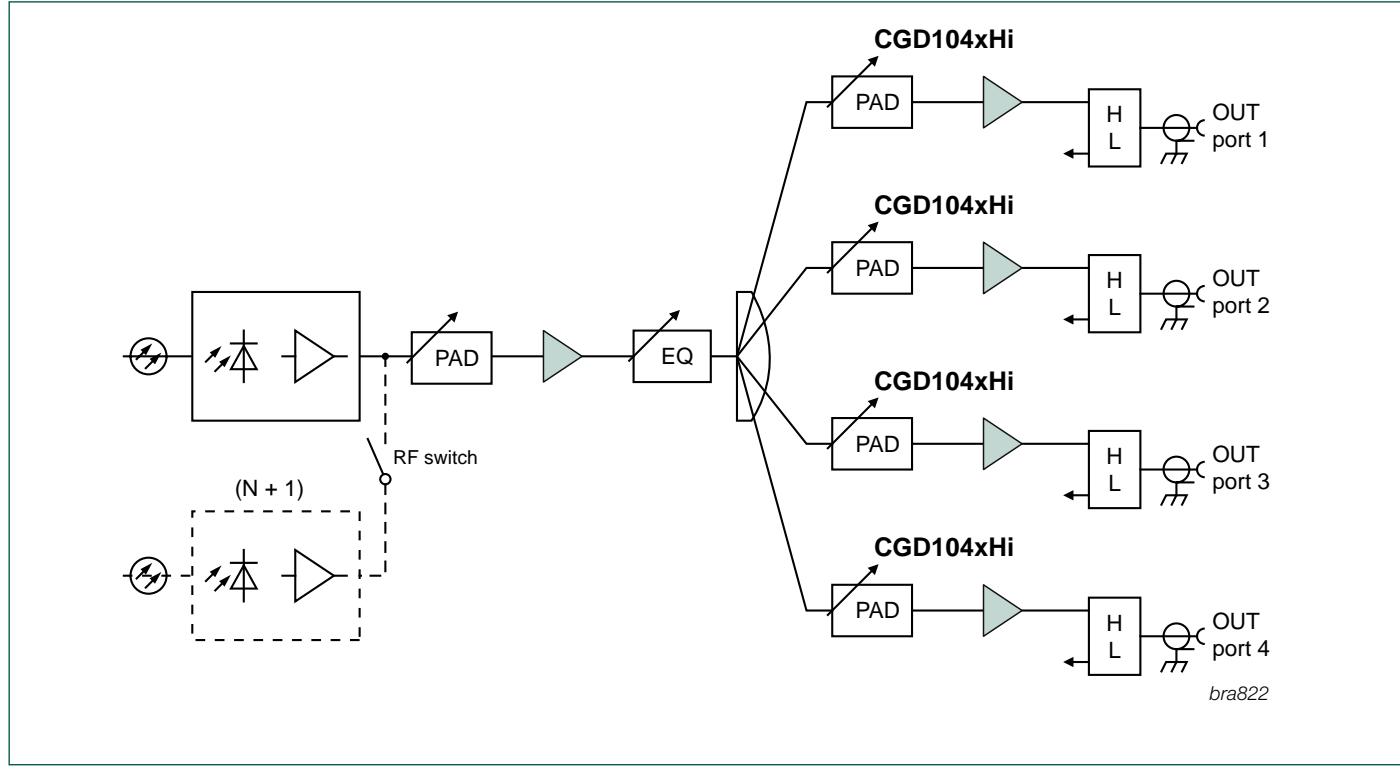

23 dB, the CGY1049 a gain of 29 dB and the CGY1032 a gain of 32 dB. NXP is also developing a new, highly integrated power doubler. The CGD1046Hi will deliver, in one IC, a 26-dB power gain with 60-dBmV output power and excellent ESD protection, for the ultimate in high-quality, distortionless devices.

2.9 Doherty amplifier technology for state-of-art wireless infrastructure

Best in class PA designs enable considerable energy savings

NXP's latest power amplifier designs enable wireless infrastructure to run with significantly higher energy efficiency – towards “Green Base Stations”. In order to achieve the highest efficiencies currently possible, NXP combines its latest generations LDMOS technology (Gen6 & 7) with the Doherty concept. This way, the optimized intrinsic performance of our LDMOS technology combines perfectly with the extrinsic Doherty technology into very efficient, high gain, readily linearizable, and lower operation cost power amplifiers.

Developed by W.H. Doherty in 1936, the Doherty amplifier remained largely dormant because the dominant mobile communication system modulation techniques (FM, GMSK and EDGE) did not require high peak-to-average ratio (PAR) signals. However, the high power added efficiency architecture of the Doherty amplifier has made it the preferred option for today's service providers for base stations transmitting 3G, 4G or multi-carrier standards.

NXP's Doherty amplifiers ensure high-efficiency while maintaining a very similar peak power capability of two transistors combined. The input and output sections are internally matched, benefiting the amplifier designs with high gain and good gain flatness and phase linearity over a wide frequency band.

Integrated Doherty

NXP can even offer the world's first fully integrated Doherty designs: From the outside these devices look like an ordinary transistor. In fact, they are completely integrated Doherty amplifiers that deliver the highest efficiency levels for base station applications. With the ease of design-in of an ordinary class AB transistor, they also provide significant space and cost savings.

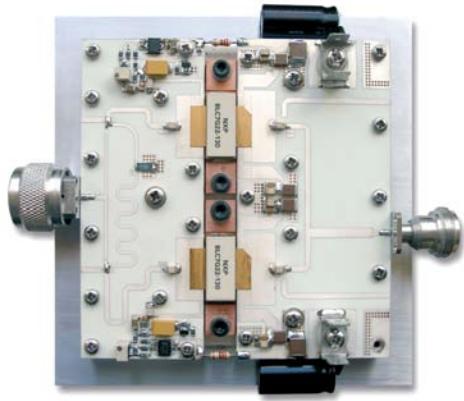

Key features & benefits

- ▶ Contains splitter, main- and peak amplifier, delay lines and combiner in one package
 - 40% efficiency @ 10 W average power
 - no additional tuning in manufacturing
- ▶ Design is as easy as with a single class AB transistor
- ▶ Ideally suited for space-constrained applications (e.g. remote radio heads, antenna arrays)
- ▶ Currently available for TD-S-CDMA (BLD6G21L(S)-50) and W-CDMA (BLD22L(S)-50); see chapter 3.7.1.4 for details

Discrete Doherty amplifiers

Next to the integrated versions, NXP also offers product demonstrators for very efficient, high power, discrete 2- and 3-way Doherty amplifiers. The 2 way designs based on the BLF7G22LS-130 device deliver 47.0 dBm (50 W) with 43% efficiency and 15.7 dB gain for W-CDMA applications.

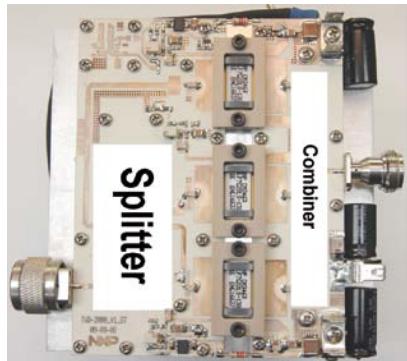

Our flagship 3-way Doherty demonstrator even achieves 48% efficiency at 48 dBm (63 W) average output power and 15.0 dB gain with a 2 carrier W-CDMA signal. The current design covers the W-CDMA standard for band 1 operation and is tailored towards high yield, minimum tuning, volume manufacturing.

Key features & benefits

- Most efficient Doherty amplifier designs available to date
- Production proven, very consistent designs
- NXP's LDMOS provides unsurpassed ruggedness
- Currently available for the following frequency bands:
 - 728 - 821 MHz
 - 869 - 960 MHz
 - 1805 - 1880 MHz (DCS)
 - 1930 - 1990 MHz (PCS)
 - 1880 - 2025 MHz (TD-SCDMA)
 - 2110 - 2170 MHz (UMTS / LTE)
 - 2300 - 2400 MHz (WiBRO / LTE)
 - 2500 - 2700 MHz (WiMAX / LTE)
 - 3300 - 3800 MHz (WiMAX)

All our product demonstrators are supported by comprehensive support documentation and hardware. Please see chapter 3.7.1.7 for a complete list of available designs.

2.10 Boost efficiency and lower system cost in wireless infrastructure with GaN

NXP GaN technology for RF power

This new gallium-nitride (GaN) technology, the result of a collaborative development effort, enables high-power amplifiers that deliver very high efficiency in next-generation wireless communication systems.

Features

- ▶ Power density that is up to five times higher than Si LDMOS
- ▶ 50 V operation
- ▶ High gain
- ▶ High efficiency
- ▶ High reliability
- ▶ Low parasitics

Benefits

- ▶ High frequency combined with high power
- ▶ Broadband operation that lets a single power amplifier function at multiple frequencies
- ▶ Enabling technology for next-generation, high-power, Switch Mode Power Amplifier (SMPA) architectures
- ▶ Lowers system costs and operational expenditures
- ▶ Ideal for tower-top base stations

Applications

- ▶ Cellular base stations
- ▶ WiMAX
- ▶ Broadcast
- ▶ Radar

Collaborating with United Monolithic Semiconductors and the Fraunhofer Institute for Applied Solid State Physics, NXP Semiconductors is developing a gallium-nitride (GaN) process technology that boosts performance of next-generation RF power amplifiers.

The new GaN process, with its high frequency combined with high power, puts NXP in the ideal position of being able to support future applications while continuing to evolve its well-established LDMOS technology.

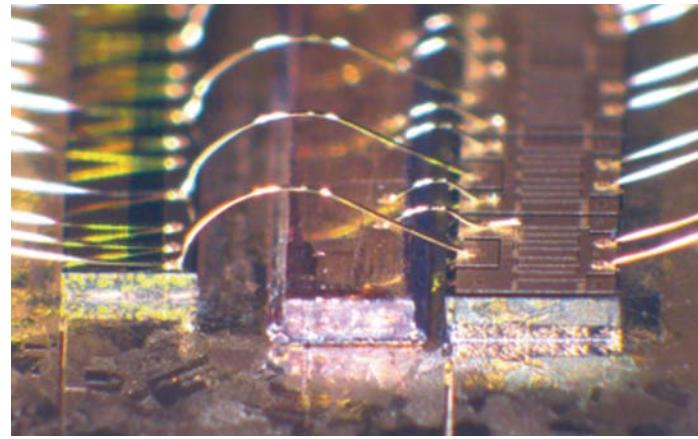

The GaN technology delivers numerous benefits to manufacturers of infrastructure equipment. Using the GaN technology in a transmitter represents a significant cost savings in system manufacturing, along with major improvements in system performance and flexibility.

Most of today's base station power amplifiers are limited to specific applications. The new GaN-based technology lets operators use a "universal transmitter" to switch between systems and frequencies, so they can instantly meet demands in the base station's coverage area. GaN transistors enable much more efficient power amplifiers and as a result drive down the operational costs of telecom operators.

GaN transistors can operate at much higher junction temperatures than Si- and GaAs-based devices, so GaN is an ideal candidate for environments with reduced cooling capabilities, such as tower-top base stations. Also, with its high power densities, GaN has the potential to expand into other areas, including high-power broadcast applications, where solid-state power amplifiers built with vacuum tubes are still the norm.

NXP's first GaN broadband power amplifiers are expected to be available in 2010, with Switch Mode Power Amplifiers (SMPAs) following quickly thereafter.

Performance (targets)	
Saturated output power at 50 V	100 W
Frequency	2.2 GHz
Maximum PAE	68%
Linear power gain	19 dB
2C-WCDMA linear efficiency with DPD	40% at -52 dBc IM3 at 8 dB OPBO

2.11 Looking for the leader in SiGe:C? You've just found us!

NXP QUBiC4 process technology

NXP's innovative high performance SiGe:C QUBiC4 process allows customers to incorporate more functionality into devices with less space, competitive cost, superb reliability and significant manufacturing advantages. Our state-of-the-art QUBiC4 technology and extensive IP availability speeds the migration from GaAs components to silicon by enabling cutting-edge products with best in class low-noise performance, linearity, power consumption, immunity to out-of-band signals, spurious performance and output power. NXP's QUBiC is a mature process in mass production since 2002 with continuous performance upgrades since then. The QUBiC4 process is automotive qualified and dual sourced in two high volume NXP-owned 8 inch waferfabs providing flexible, low cost manufacturing with high yields and very low ppm in the field.

QUBiC4 in 3 variants, each having it's benefits for specific application areas:

QUBiC4+

The QUBiC4+ BiCMOS process features 0.25 µm CMOS with 5 metal layers for integration of dense digital logic based smart functionality, a rich set of active and passive devices for high-frequency mixed-signal designs including thick top metal layers for high quality inductors. The device set; includinges a 37 GHz FT NPNs with 3.8 V breakdown voltage (BVce0) and low noise figure (NF < 1.1 @ 2 GHz), 7 GHz ft VNPNs, a 28 GHz high voltage NPN with 5.9 V breakdown voltage, differential and single ended varicaps with Q-factor>30, scalable inductors with Q-factor>20, 800 MHz FT lateral PNP's, 0.25 µm CMOS, 137, 220 & 12 to 2000 ohm/sq. poly and active resistors, a 270 ohm/sq. SiCr thin film resistor, a 5.7 fF/µm² oxide capacitor and an 5 fF/µm² MIM capacitor, 1 to 6 fF/µm² oxide capacitors and various other devices including L-PNPs, isolated NMOS, 3.3 V CMOS and RF-CMOS transistorscapacitor. The QUBiC4+ process is: silicon based and , ideal for applications up to 5 GHz (Ft = 37 GHz , NF < 1.1 dB @ 1.2 GHz) and e.g. for medium power amplifiers up to 33 dBm.

QUBiC4X

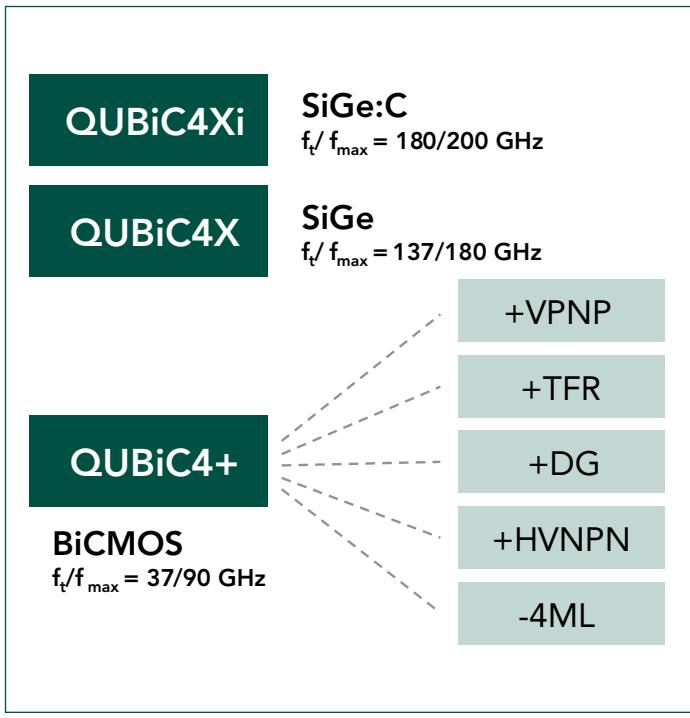

The QUBiC4X BiCMOS process is a SiGe:C based extension of the QUBiC process for high-frequency mixed signal designs and offers on top of features the a rich set of devices for QUBiC high-frequency mixed-signal designs; including also a 140 GHz FT NPN with 2.5 V breakdown voltage and very low noise figure (NF < 1.0 @ 10GHz). s, 0.25 µm CMOS, 220, a variety of resistors, a 5.7 fF/µm² oxide capacitor and a 5 fF/µm² MIM capacitor.

The QUBiC4X: first SiGe:C process is, ideal for applications typically up to 30 GHz (Ft = 137 GHz , NF < 0.8dB @ 10 GHz) and ultra low noise applications, e.g. LNAs and mixers.

QUBiC4Xi

The QUBiC4Xi BiCMOS process further enhances the QUBiC4X process and offers additionally a features a set of devices for high-frequency mixed-signal designs; including 180 GHz FT NPNs with 1.4 V breakdown voltage and ultra-low noise figure (NF < 0.7 @ 10 Ghz), 0.25 µm CMOS, several resistors, a 5.7 fF/µm² oxide capacitor and a 5 fF/µm² MIM capacitor. QUBiC4Xi is the: newest SiGe:C process improved on Ft (> 200 GHz) and even lower noise figure (NF < 0.5 7 dB @ 10 GHz) and is, ideal for applications beyond 30 GHz, e.g. LO generators.

QUBiC4+

- ▶ Baseline, 0.25um CMOS, single poly, 5 metal
- ▶ Digital gate density 26k gates/mm²
- ▶ $f_T/f_{MAX} = 37/90 \text{ GHz}$
- ▶ +TFR – Thin Film Resistor
- ▶ +DG – Dual Gate Oxide MOS
- ▶ +HVNPN – High Voltage NPN
- ▶ +VPPN – Vertical PNP
- ▶ -4ML – high density 5fF/ μm^2 MIM capacitor
- ▶ Wide range of active and high quality passive devices
- ▶ Optimized for up to 5GHz applications

QUBiC4X

- ▶ SiGe:C process
- ▶ $f_T/f_{MAX} = 137/180 \text{ GHz}$
- ▶ optimized for up to 15 GHz applications

QUBiC4Xi

- ▶ Improves fT/fMAX up to 180/200 GHz
- ▶ Optimized for ultra-low noise for microwave above 10 GHz

2.12 Microwave / Radar

NXP, your partner in High Performance microwave applications

NXP has a 50+ years history in semiconductor technology and component design. For more than 3 decades we are leading in providing high performance RF technologies for microwave applications. The company has built a strong position in the field of RF small signal and power transistors for microwave amplifiers with a solid and growing, and best-in-class Si devices and processing technologies.

We were the first semiconductor company to supply S-band transistors (2700 - 3500 MHz) based on laterally diffused metal-oxide-silicon (LDMOS). To further strengthen our position towards the future, we currently develop new high power and high-bandwidth technologies based on gallium nitride (GaN) material.

Another enabling technology is NXP's BICMOS process QUBiC that is available in several variants with f_T up to 200 GHz, each specialized to address specific small signal RF applications.

The product portfolio encompasses:

- Low noise amplifiers (LNA)
- Variable gain amplifiers (VGA)
- Mixers,
- Local oscillators (LO)
- LO Generators

Coming from a component background, NXP now also focuses on architectural breakthroughs by highly integrated products for microwave and millimeter wave. One example is a family of LO Generators from 7G Hz to 15 GHz with integrated Phase-Locked Loop and Voltage Controlled Oscillator.

Another example is an integrated RF power module in S-band (3.1-3.5 GHz) at 200 W. Both products are highlighted in the following:

RF small signal product highlight:

LO generators TFF11xxxHN

Manufactured in NXP's breakthrough QUBiC4X SiGe:C process technology, these highly integrated, alignment-free LO generators are low-power, low-spurious solutions that simplify design-in and lower the total cost of ownership.

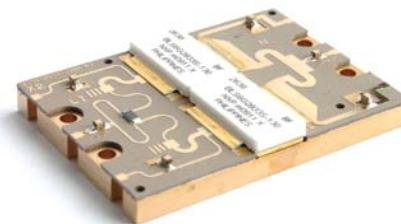

Features

- ▶ Lowest noise LO generators for 7 to 15 GHz range
- ▶ Maximum power consumption for all types, typical 330 mW
- ▶ Phase-noise compliant with IESS-308 (Intelsat)
- ▶ Proven QUBiC4X SiGe:C technology (120 GHz f_T process)
- ▶ External loop filter
- ▶ Differential input and output
- ▶ Lock-detect output
- ▶ Internally stabilized voltage reference for loop filter

RF Power product highlight !

The BLS6G2933P-200 is the first LDMOS based, industry standard pallet produced by NXP. This pallet offers more than 40% efficiency and includes the complete bias network for S-band applications.

Features:

- ▶ Reduces component count and considerably simplifies radar system design
- ▶ P1 dB output power 200 W
- ▶ Efficiency > 40%
- ▶ Industry standard footprint
- ▶ 50 Ω in/out matched for entire bandwidth
- ▶ Lightweight heat sink included
- ▶ The advantages of LDMOS in comparison with Bipolar
 - Higher gain and better efficiency
 - Better ruggedness – overdrive without risk to 5 dB
 - Improved pulse droop and insertion phase
 - Very consistent performance – no tuning required
 - Improved thermal characteristics, no thermal runaway
 - Non-toxic packaging and ROHS compliance

Microwave applications and bands of operation

System	Frequency
VHF and UHF	<1 GHz
L-Band	1200 - 1400 MHz
S-Band	2700 - 3500 MHz
X-band	8000 - 12000 MHz
Commercial Avionics	
DME (Distance Measuring Equipment)	978 - 1215 MHz
Transponders	
Mode A / Mode S / Mode C / TCAS	1030 - 1090 MHz
Military Avionics	
IFF Transponders (Identification, Friend or Foe)	1030 - 1090 MHz
TACAN (Tactical Air Navigation)	960 - 1215 MHz
JTIDS / MIDS (Joint Tactical Information Distribution System)	960 - 1215 MHz
Marine radar	9300 - 9500 MHz

For a complete list of products see the respective small signal and power microwave pages

2.13 Digital broadcasting at its best

The BLF881 / BLF888 transistor line-up enables today's most powerful and efficient digital broadcast transmitter applications

BLF881

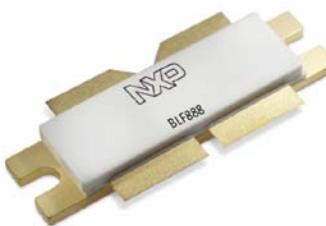

The transistor is based on NXP's new 50V LDMOS technology, and features 140 W RF output power for broadcast transmitter and industrial applications. An unmatched device, the BLF881 can be used in the HF to 1 GHz range. The excellent ruggedness and broadband performance of this device makes it ideal for digital transmitter applications – either stand alone or as a driver in combination with the high-power transistor BLF888.

The BLF881 is also available in an earless version: BLF881S, enabling an even more compact PCB design.

BLF888

Also based on the new 50 V technology created by NXP, the BLF888 is the most powerful LDMOS broadcast transistor to date. The 500 W LDMOS device is specifically designed for digital broadcast transmitter applications. The transistor delivers 110 W average power for a DVB-T signal over the full UHF band from 470 MHz to 860 MHz. The excellent efficiency and ruggedness of this device makes it ideal as the final stage for advanced digital transmitter applications

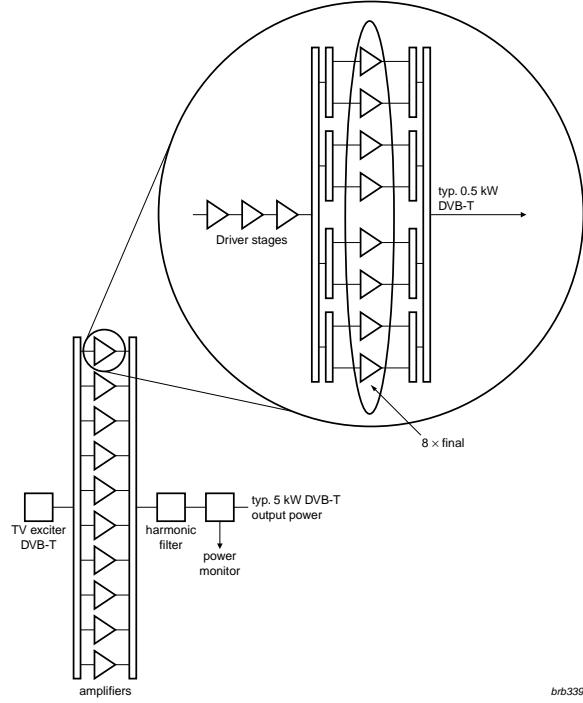

Key benefits

- ▶ 50 V operations to achieve highest power levels in the market
- ▶ Best-in-class ruggedness designed into all devices
- ▶ Best broadband efficiency
- ▶ Best-in-class design support
- ▶ Very low thermal resistance design for unrivalled reliability

Key applications

- ▶ Analogue and digital TV transmitters

Device	f _{range} (MHz)	P _{L(AV)} W	n _D %	G _p dB	@V _{DS} V	Mode of operation
BLF881(S)	0 - 1000	120	48	21	50	2-TONE
	0 - 1000	30	31	21	50	DVB-T
BLF888	470 - 860	250	46	19	50	2-TONE
	470 - 860	110	31	19	50	DVB-T

3.2 RF diodes

3.2.1 Varicap diodes

NEW: Varicap selection guide on www.nxp.com/varicaps

Easy-to-use parametric filters help you to choose the right varicap for your design.

Why choose NXP semiconductors' varicap diodes:

- ▶ Reference designs for TV and radio tuning
- ▶ Direct matching process
- ▶ Small tolerances
- ▶ Short leadtimes
- ▶ Complete portfolio covering broad frequency range and variety in package (including leadless)
- ▶ Reliable volume supply

VCO and FM radio tuning varicap diodes

3.2.2 PIN diodes

NEW: Pin diode selection guide on www.nxp.com/pindiodes
Easy-to-use parametric filters help you to choose the right pin diode for your design.

Why choose NXP Semiconductors' PIN diodes:

- ▶ Broad portfolio
- ▶ Unrivalled performance
- ▶ Short leadtimes
- ▶ Low series inductance
- ▶ Low insertion loss
- ▶ Low capacitance

Look for more graphs showing the Pin diode line-up at other frequencies on our web site: www.nxp.com/pindiodes

3.2.3 Band-switch diodes

Why choose NXP Semiconductors' bandswitch diodes:

- Reliable volume supplier
- Short leadtimes
- Low series Inductance
- Low Insertion loss
- Low capacitance
- High reverse Isolation

Type	Package	V _R max (V)	I _F max (mA)	r _D max (Ω)	@ I _F = (mA)	@ f = (MHz)	C _d max (pF)	@ V _R = (V)	@ f = (MHz)

3.2.4 Schottky diodes

NEW: Schottky diode selection guide on www.nxp.com/rfschottkydiodes
Easy-to-use parametric filters help you to choose the right schottky diode for your design.

Why choose NXP Semiconductors' schottky diodes

- (Very) low diode capacitance
- (Very) low forward voltage
- Single and triple-isolated diode
- (Ultra / very) small package

Applications

- Digital applications:
 - ultra high-speed switching
 - clamping circuits
- RF applications:
 - diode ring mixer
 - RF detector
 - RF voltage doubler

Low-capacitance Schottky diodes

Type	Package	Configuration	V _R max. (V)	I _F max. (mA)	V _F max. (mV)	C _D max. (pF)

3.3 RF Bipolar transistors

3.3.1 Wideband transistors

NEW: RF wideband transistor selection guide on www.nxp.com/rftransistors
Easy-to-use parametric filters help you to choose the right RF wideband transistor for your design.

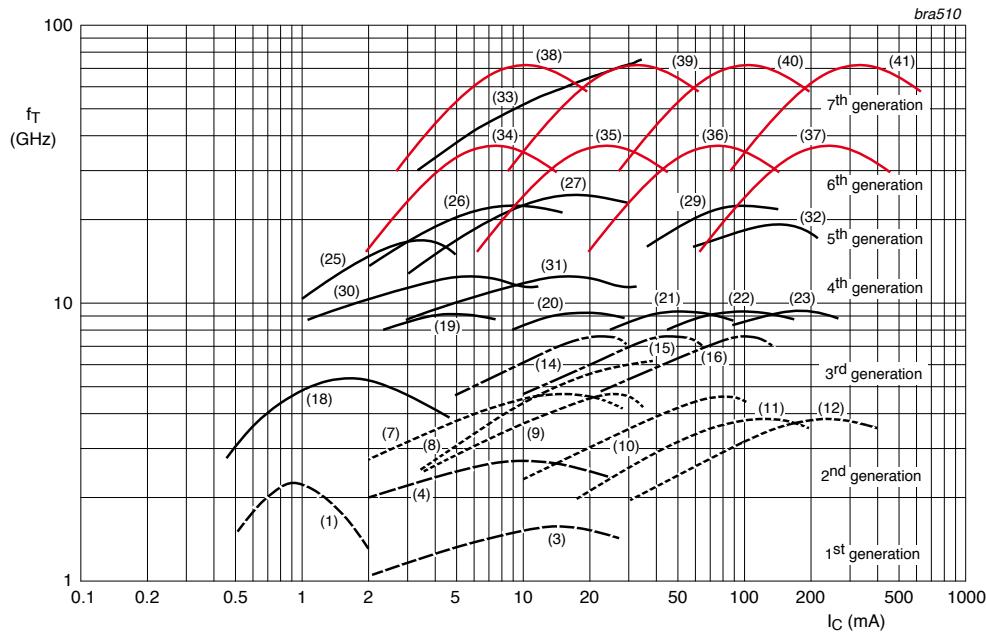

Why choose NXP Semiconductors' wideband transistors

- ▶ Broad portfolio (1st - 7th generation)
- ▶ Short leadtimes
- ▶ Smallest packages
- ▶ Volume delivery

Wideband transistors

The $f_T - I_C$ curve represents Transition Frequency (f_T) characteristics as a function of collector current (I_C) for the six generations of RF wideband transistors. A group of transistors having the same collector current (I_C) & similar transition frequencies (f_T) represents a curve. The curve number matches products in the table, detailing their RF characteristics.

Wideband transistors line-up per frequency

PIN	DESCRIPTION
Type (see Fig.1)	
1	collector
2	base
3	emitter
4	emitter
Type/X (see Fig.1)	
1	collector
2	emitter
3	base
4	emitter
Type/XR (see Fig.2)

3.4 RF ICs

3.4.1 MMICs

NEW: RF MMIC selection guide on www.nxp.com/mmics Easy-to-use parametric filters help you to choose the right zRF MMIC for your design.

Why choose NXP Semiconductors' MMICs

- ▶ Reduced RF component count
- ▶ Easy circuit design-in
- ▶ Reduced board size
- ▶ Short time-to-market
- ▶ Broad portfolio
- ▶ Volume delivery
- ▶ Short leadtimes
- ▶ Excellent gain flatness[^]
- ▶ No output inductor necessary anymore[^]

[^] = only for new satellite IF gain blocks, BGA28xx-family.

General-purpose wideband amplifiers (50 Ohm gain blocks)

3.5.2 MOSFETs

NEW: RF MOSFET selection guide on www.nxp.com/rffets Easy-to-use parametric filters help you to choose the right RF MOSFET for your design.

Why choose NXP Semiconductors' MOSFETs

- ▶ Reference designs for TV tuning
- ▶ Short leadtimes
- ▶ Broad portfolio
- ▶ Smallest packages
- ▶ 2-in-1 FETs for tuner applications
- ▶ Reliable volume supply
- ▶ Best performance MOSFETs for TV tuning

3.6 RF Modules

NEW: CATV module selection guide on www.nxp.com/catv
Easy-to-use parametric filters help you to choose the right
CATV module for your design.

Why choose NXP Semiconductors' RF Modules

- ▶ Excellent linearity, stability and reliability
- ▶ Rugged construction
- ▶ Extremely low noise
- ▶ High power gain
- ▶ Low total cost of ownership

CATV types for Chinese (C-types) and 1GHz GaAs HFET line ups

New in our CATV Hybrid portfolio are two families of products. The C types are specially designed for the Chinese market, customized for two major governmental projects. And the GaAs HFET 1 GHZ complete line up for high end applications all around the world.

Both families will be extended in the following months to cover all of the two specific market segments.

C types (China)

- ▶ CATV push pulls, chapter 3.6.2: BGY588C, BGE788C, CGY888C
- ▶ CATV power doublers, chapter 3.6.3: BGD712C
- ▶ CATV optical receivers, chapter 3.6.4: BGO807C

1GHz GaAs HFET very high end Hybrids

- ▶ CATV push pulls, chapter 3.6.2 : CGY1047, CGY1041, CGY1043
- ▶ CATV power doublers, chapter 3.6.3: CGD1040Hi, CGD1042Hi, CGD1044Hi, CGD1046Hi, CGD1042H, CGD1044H

3.6.1 CATV Reverse Hybrids

Frequency range	Type number	Gain (dB)	Slope (dB)	FL	RL _{IN} /RL _{OUT}	CTB	XMOD	CSO	@ Ch	@ Vo (dBmV)	NF @ f _{MAX}	I _{tot} (mA)
5 -75 MHz	BGY68	29.2 - 30.8	-0.2 - 0.5	± 0.2	20/20	-68	-60	-	4	50	3.5	135

* = check status at 3.1 new products, as this type has not been released yet for mass production.

Bold Red = New, highly recommended product

Bold = Highly recommended product

NOTES: This table is for reference only.

For full data please refer to the latest datasheet.

For availability please check the NXP Sales office.

Description

Frequency range: minimum and maximum frequency in MHz at which data are characterized @Ch/@Vo. The number of channels and the output voltage at which CTB, XMOD, CSO, IMD2 and IMD3 are characterized @fm. Measurement frequency is fm. Noise Figure is in dB or Noise in pA/Sqrt(Hz). FL_{SL} is Flatness straight line. S is Minimum responsivity of optical receivers.

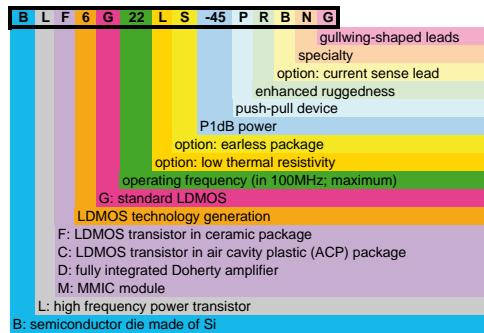

3.7 RF power transistors

NEW: RF power transistor selection guide on www.nxp.com/rfpower
Easy-to-use parametric filters help you to choose the right RF power transistor for your design.

3.7.1 Base Station transistors

http://www.nxp.com/products/mosfets/rf_power_transistors_ldmos/basestations/index.html#preview

Device naming conventions RF power base stations transistors

Why choose NXP Semiconductors' RF power transistors for base stations:

- ▶ Leading technology (generation 6 and 7 of LDMOS)
- ▶ Highest (system) efficiency
- ▶ Best ruggedness
- ▶ Advanced Doherty amplifier designs
- ▶ Industry's first 3.8 GHz Doherty
- ▶ Industry's first fully integrated Doherty amplifier

NXP offers complete line-ups of RF power transistors operation from 800 MHz right up to 3.8 GHz for base stations, covering all cellular technologies (MC-GSM/EDGE, TDMA, (TD-S)CDMA, W-CDMA/UMTS) and WiMAX infrastructures.

3.7.1.1 0.7 - 1.0 GHz line-up

3.7.2 Broadcast / ISM (industrial, scientific, medical) RF power transistors

http://www.nxp.com/products/mosfets/rf_power_transistors_ldmos/broadcast_ism/index.html#preview

Why choose NXP Semiconductors' RF power transistors for broadcast / ISM applications:

- ▶ Highest power
- ▶ Best ruggedness
- ▶ Best broadband performance
- ▶ Best-in-class design support
- ▶ Very low thermal resistance design for unrivalled reliability

NXP's leading LDMOS technologies together with advanced package concepts enable best in class performing power amplifiers. We offer industry's highest power and best ruggedness for all broadcast technologies.

Our portfolio includes transistors for Ultra High Frequency (UHF), Very High Frequency (VHF) and High Frequency (HF) applications as well as covering ISM frequency bands.

3.7.2.1 0-1000 MHz (UHF/VHF/HF/ISM) LDMOS Line up

Function	Type	Package	f_{range}	$P_{L(AV)}$	η_D	G_p	$@V_{DS}$	Mode of operation

3.7.3 Microwave LDMOS RF power transistors

http://www.nxp.com/products/mosfets/rf_power_transistors_ldmos/microwave_ldmos/index.html#preview

Device naming conventions RF power microwave transistors

B	L	S	6	G	2731	S	-120	G
option: gullwing shaped leads								
P1dB power								
S: earless package								
P: pallet								
frequency band (in 100MHz; here: 2700-3100)								
G: standard LDMOS (<=28V)								
H: high voltage LDMOS (50V)								
LDMOS technology generation								
A: avionics frequency band operation								
L: L-Band frequency operation								
S: S-Band frequency operation								
L: high frequency power transistor								
B: semiconductor die made of Si								

Why choose NXP Semiconductors' microwave RF power transistors

- ▶ High gain
- ▶ High efficiency
- ▶ Highest reliability
- ▶ Improved pulse droop and insertion phase
- ▶ Improved ruggedness - overdrive without risk to +5 dB
- ▶ Reduces component count and helps simplify L- and S-band radar design
- ▶ Uses non-toxic, ROHS compliant packages

3.7.3.1 Avionics LDMOS transistors

Function	Type	Package	f _{range}	P _L	η _D	G _p	@V _{DS}	Mode of operation
			MHz	W	%	dB	V	
driver	BLL6H0514-25	SOT467C	500 - 1400	25 (min)	50	19	50	PULSED RF; class AB
final	BLA6H0912-500	SOT634A	960 - 1215	450	50	17	50	PULSED RF; class AB
final	BLA6H1011-600	SOT539A	1030 - 1090	600	52	19	50	PULSED RF; class AB
final	BLA6G1011-200R	SOT502A2	1030 - 1090	200	65	20	28	PULSED RF; class AB

3.7.3.2 L-band LDMOS transistors

Function	Type	Package	f _{range}	P _L	η _D	G _p	@V _{DS}	Mode of operation
			MHz	W	%	dB	V	
driver	BLL6H0514-25	SOT467C	500 - 1400	25 (min)	50	19	50	PULSED RF; class AB

3.8 High Speed Data Converters

Analog performance, power optimization and ease of use are the perennial industry challenges for high-speed data converters used in communications. For many years NXP has been quietly developing data converters for captive applications. It is now opening its high-speed data converters to the entire market, offering a broad portfolio of highly competitive ADCs and DACs featuring three different data interfaces, including the industry's first implementation of the JEDEC JESD204A serial data interface.

3.8.1 High Speed ADCs

Type	Description	Supply Voltage (V)	Power Dissipation (mW)	SFDR (dBc)	SNR (dBFS)	Digital Interface	Package
ADC1613D series	Dual 16-bit ADC up to 65/80/105/125Msps with serial interface	1.8 / 3.3	445	93	73.2	JESD204A	HVQFN56 8x8
ADC1610S series	Single 16-bit ADC up to 65/80/105/125Msps	1.8 / 3.3	350	93	73.2	LVC MOS and LVDS/DRR	HVQFN40 6x6
ADC1415S series	Single 14-bit ADC up to 65/80/105/125Msps with input buffer	1.8 / 3.3/5	550	91	73.2	LVC MOS and LVDS/DRR	HVQFN40 6x6
ADC1413D series *	Dual 14-bit ADC up to 65/80/105/125Msps with serial interface	1.8 / 3.3	445	91	73.2	JESD204A	HVQFN56 8x8
ADC1412D series	Dual 14-bit ADC up to 65/80/105/125Msps	1.8 / 3.3	350	91	73.2	LVC MOS and LVDS/DRR	HVQFN64 9x9
ADC1410S series	Single 14-bit ADC up to 65/80/105/125Msps	1.8 / 3.3	350	91	73.2	LVC MOS and LVDS/DRR	HVQFN40 6x6
ADC1215S series	Single 12-bit ADC up to 65/80/105/125Msps with input buffer	1.8 / 3.3/5	550	91	70.7	LVC MOS and LVDS/DRR	HVQFN40 6x6
ADC1213D series	Dual 12-bit ADC up to 65/80/105/125Msps with serial interface	1.8 / 3.3	445	91	70.7	JESD204A	HVQFN56 8x8
ADC1212D series *	Dual 12-bit ADC up to 65/80/105/125Msps	1.8 / 3.3	350	91	70.7	LVC MOS and LVDS/DRR	HVQFN64 9x9
ADC1210S series	Single 12-bit ADC up to 65/80/105/125Msps	1.8 / 3.3	350	91	70.7	LVC MOS and LVDS/DRR	HVQFN40 6x6
ADC1207S080	Single 12-bit ADC 80 Msps	5	840	90	71	parallel LVC MOS	HTQFN48 7x7
ADC1206S series	Single 12-bit ADC 40/50/70 Msps	3.3 / 5.0	550	72	64	parallel CMOS and TTL	QFP44
ADC1115S125	Single 11-bit ADC up to 125Msps with input buffer	1.8 / 3.3/5	790	90	66.7	LVC MOS and LVDS/DRR	HVQFN40 6x6
ADC1113D125	Dual 11-bit ADC up to 125Msps with serial interface	1.8 / 3.3	635	90	66.7	JESD204A	HVQFN56 8x8
ADC1015S series	Single 10-bit ADC up to 65/80/105/125Msps with input buffer	1.8 / 3.3/5	550	91	61.7	LVC MOS and LVDS/DRR	HVQFN40 6x6
ADC1010S series	Single 10-bit ADC up to 125Msps	1.8 / 3.3	350	91	61.7	LVC MOS and LVDS/DRR	HVQFN40 6x6
ADC1006S series	Single 10-bit ADC 50/70 Msps	3.3 / 5.0	550	71	59	parallel CMOS and TTL	QFP44

3.8.2 High Speed DACs

Type	Description	Supply Voltage (V)	Power Dissipation (mW)	SFDR (dBc)	Interpolation	Package
DAC1408D series *	Dual 14-bit DAC up to 650/750 Msps	1.8 / 3.3	850	77	2x, 4x, 8x	HVQFN64 9x9
DAC1405D series	Dual 14-bit DAC up to 650/750 Msps	1.8 / 3.3	550	77	2x, 4x, 8x	HTQFP100 14x14
DAC1403D160	Dual 14-bit DAC 160 Msps	3.3	210	80	2x	HTQFP80 12x12
DAC1401D125	Dual 14-bit DAC 125 Msps	3.3	105	88	-	LQFP48
DAC1208D series	Dual 12-bit DAC up to 650/750 Msps	1.8 / 3.3	850	77	2x, 4x, 8x	HVQFN64 9x9
DAC1205D series	Dual 12-bit DAC up to 650/750 Msps	1.8 / 3.3	550	80	2x, 4x, 8x	HTQFP100 14x14
DAC1203D160	Dual 12-bit DAC 160 Msps	3.3	210	77	2x	HTQFP80 12x12
DAC1201D125	Dual 12-bit DAC 125 Msps	3.3	105	65	-	LQFP48
DAC1008D series	Dual 10-bit DAC up to 650/750 Msps	1.8 / 3.3	850	77	2x, 4x, 8x	HVQFN64 9x9
DAC1005D series	Dual 10-bit DAC up to 650/750 Msps	1.8 / 3.3	550	77	2x, 4x, 8x	HTQFP100 14x14
DAC1003D160	Dual 10-bit DAC 160 Msps	3.3	210	80	2x	HTQFP80 12x12
DAC1001D125	Dual 10-bit DAC 125 Msps	3.3	105	65	-	LQFP48

* = check status at 3.1 new products, as this type has not been released yet for mass production.

Bold Red = New, highly recommended product

4. Design support

This chapter will make it easier to find and get hold of design-in information and materials, with web links or references to the NXP representative / authorized distributor.

Streamline your RF design with leading RF EDA software

Design kits of the NXP high performance RF small signal products.

NXP offers its RF small signal portfolio in leading RF Electronic Design Automation (EDA) software of: Ansoft Designer RF, AWR Microwave Office and Agilent Advanced Design System (ADS), including installation manuals, on the NXP web: www.nxp.com/models. To predict the behavior of a design by performing simulations, RF EDA software enables design engineers to reduce the number of design cycles, lower the risks and make better RF component choice for RF applications.

4.1 S-Parameters

S-Parameters help you to simulate the behaviour of our devices to your specific adjustments for e.g. voltage, current.

Wideband transistors, FETs & MMICs

First, click on the type number, which takes you directly to the corresponding product information page on the NXP Semiconductors internet.

Second, scroll down on this product information page to find the S-Parameters.

4.2 Simulation models

Spice models

Spice models help you to create the optimal performance and to understand which external components have a certain influence on that performance.

Wideband transistors, FETs & Varicaps diodes

First, click on the type number which takes you directly to the corresponding product information page on the NXP Semiconductors internet.

Second, scroll down on this product information page to find the Spice models.

4.2.2 RF Power device simulation models

For easy design-in, NXP provides fully physics based, electro-thermal models for the RF power transistors. These models are available for Advanced Design System (ADS)[®] from Agilent and for Microwave Office (MWO)[®] from Applied Wave Research (AWR). Newly developed models per product are based on the best in class RFLDMOS model, developed by NXP Research, a recognized leader in physics based models. This concept yields most reliable simulation results over a wide range of electrical conditions. The standard models fully support DC, AC, s-parameter (small signal), harmonic balance (large signal) and time domain simulations. NXP RF power models allow designers to assess the performance of complex PA systems at an early stage of the development process.

The available models come with all necessary libraries and documentation, and can be downloaded at NXP's website.

4.3 Application notes

http://www.nxp.com/products/all_appnotes/

For the application notes we refer you to chapter 1 of this manual. For each application, we have given the recommended application notes which are available on the internet (with interactive link) or via your local NXP representative or authorized distributor (look at the last chapter: Web Links and Contacts).

4.4 Demo boards

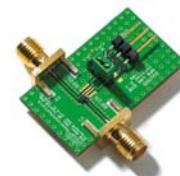

BGA2001 demo board

4.4.1 IC, MMIC and SiGe:C transistor demo boards

RF Small Signal demo boards are available (although limited) via your local NXP representative or authorized distributor (look at the last chapter: Web Links and Contacts).

Different versions available
via NXP sales representative

4.5 Samples of products in development

For development samples, please ask your local NXP representative or authorized distributor (see last chapter: Web Links and Contacts) to order the latest versions at the RF development team.

4.6 Samples of released products

For all released and most non-released products for RF power, samples are available in the sample warehouse. Look on the home page of the NXP web site for the link to the online sample store: www.nxp.com

4.7 Datasheets

For all released and most non-released products for RF power, datasheets are available on the NXP Semiconductors internet. Simply 'clicking' on a product type (in this manual chapter 1 or 2) takes you to the corresponding product information page on the NXP Semiconductors website.

4.8 Design-in support

If you need special design-in support from our design-in engineers, please ask your local NXP representative or authorized distributor (see last chapter: Web Links and Contacts), to pass on your request to the RF development teams.

4.9 NEW: interactive selection guides

For all RF product groups, you can find easy-to-use parametric filters to help you to chose the right device for your design, e.g. www.nxp.com/mmics, click on selection guide.

6.2 Marking codes list

Search online on marking code: <http://www.nxp.com/package/>

In alphabetical order of marking code

In case a '%' is given in the marking code, it means this type can be assembled at different assembly sites.

Instead of a '%', you will find:

p = made in Hong-Kong

t = made in Malaysia

W = made in China

7. Abbreviations

3-way	Doherty design using 3 discrete transistors	MPPM	Main and peak device realized in same push pull transistor (2 times)
AM	Amplitude Modulation	MoCA	Multimedia over Coax Alliance
ASIC	Application Specific Integrated Circuit	MOSFET	Metal–Oxide–Semiconductor Field Effect Transistor
ASYM	Asymmetrical design of Doherty (main and peak device are different)	MPA	Medium Power Amplifier
BPF	Band Pass Filter	MRI	Magnetic resonance imaging
BUCK	Block Up Converter	NF	Noise Figure
CATV	Community Antenna Television	NIM	Network Interface Module
CDMA	Code Division Multiple Access	NMR	Nuclear magnetic resonance
CMMB	Chinese Multimedia Mobile Broadcasting	PA	Power Amplifier
CMOS	Complementary Metal Oxide Semiconductor	PAR	Peak to Average Ratio
CQS	Customer Qualification Samples	PEP	Peak Envelope Power
DAB	Digital Audio Broadcasting	pHEMT	pseudomorphic High Electron Mobility Transistor
DECT	Digital Enhanced Cordless Telecommunications	PLL	Phase Locked Loop
DiSEqC	Digital Satellite Equipment Control	QUBiC	Quality BiCMOS
DSB	Digital Signal Processor	RF	Radio Frequency
DVB	Digital Video Broadcasting	RFS	Release for Supply
EDGE	Enhanced Data Rates for GSM Evolution	RoHS	Restriction of Hazardous Substances
ESD	Electro Static Device	RX	Receive
FET	Field Effect Transistor	SARFT	State Administration for Radio, Film and Television
FM	Frequency Modulation	SER	Serializer
GaAs	Gallium Arsenide	SiGe:C	Silicon Germanium Carbon
GaN	Gallium Nitride	SMATV	Satellite Master Antenna Television
Gen	Generation	SMD	Surface Mounted Device
GPS	Global Positioning System	SPDT	Single Pole, Double Throw
GSM	Global System for Mobile communications	SYM	Symmetrical design of Doherty (main and peak device are the same type of transistor)
HBT	Heterojunction Bipolar Transistor	TD-SCDMA	Time Division-Synchronous Code Division Multiple Access
HDTV	High Definition Television	TCAS	Traffic Collision Avoidance Systems
HF	High Frequency (3-30 MHz)	TMA	Tower Mounted Amplifier
HFC	Hybrid Fiber Coax	TTFF	Time to first fix
HFET	Heterostructure Field Effect Transistor	TX	Transmit
HPA	High Power Amplifier	UHF	Ultra High Frequency (470-860MHz)
HVQFN	Plastic thermally enHanced Very thin Quad Flat pack No leads	UMTS	Universal Mobile Telecommunications System
IF	Intermediate Frequency	VCO	Voltage Controlled Oscillator
ISM	Industrial, Scientific, Medical - reserved frequency bands	VGA	Variable Gain Amplifier
LDMOS	Laterally Diffused Metal-Oxide-Semiconductor	VHF	Very High Frequency (30-300MHz)
LNA	Low Noise Amplifier	VoIP	Voice over Internet Protocol
LNB	Low Noise Block	VSAT	Very Small Aperture Terminal
LO	Local Oscillator	WCDMA	Wideband Code Division Multiple Access
LPF	Low Pass Filter	WiMAX	Worldwide Interoperability for Microwave Access
MESFET	Metal Semiconductor Field Effect Transistor	WLAN	Wireless Local Area Network
MMIC	Monolithic Microwave Integrated Circuit		
MMPP	Main and peak devices realized separately in halves of push pull transistor		

8. Contacts and web links

How to contact your authorized distributor or local NXP representative?

Authorized distributors

Asia Pacific:
