

## 20 W + 20 W dual BTL class-D audio amplifier

### Features

- 20 W + 20 W continuous output power:  
 $R_L = 8 \Omega$ , THD = 10% at  $V_{CC} = 18 V$
- Wide range single supply operation (5 V - 18 V)
- High efficiency ( $\eta = 90\%$ )
- Four selectable, fixed gain settings of nominally 20 dB, 26 dB, 30 dB and 32 dB
- Differential inputs minimize common-mode noise
- No 'pop' at turn-on/off
- Standby and mute features
- Short-circuit protection
- Thermal overload protection
- Externally synchronizable

### Description

The TDA7491HV is a dual BTL class-D audio amplifier with single power supply designed for LCD TVs and monitors.

Thanks to the high efficiency and exposed-pad-down (EPD) package no separate heatsink is required.

The TDA7491HV is pin-to-pin compatible with the TDA7491P and TDA7491LP.

**Table 1. Device summary**

Order code	Operating temperature	Package	Packaging
TDA7491HV	-40 to 85°C	PowerSSO-36 EPD	Tube
TDA7491HV13TR	-40 to 85°C	PowerSSO-36 EPD	Tape and reel

## 4 Characterization curves

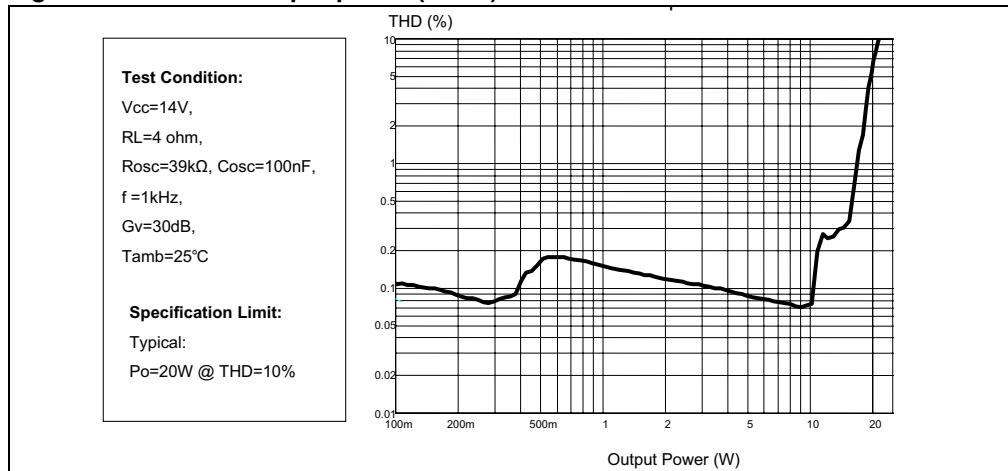

The following characterization curves were made using the TDA7491HV demo board. The LC filter for the 4- $\Omega$  load uses components of 15  $\mu$ H and 470 nF, whilst that for the 6- $\Omega$  load uses 22  $\mu$ H and 220 nF and that for the 8- $\Omega$  load uses 33  $\mu$ H and 220 nF.

In order to meet environmental requirements, ST offers these devices in different grades of ECOPACK® packages, depending on their level of environmental compliance. ECOPACK® specifications, grade definitions and product status are available at: [www.st.com](http://www.st.com).  
 ECOPACK® is an ST trademark.

## 6 Applications circuit

Figure 50. Applications circuit for class-D amplifier

## 7 Application information

### 7.1 Mode selection

The three operating modes , defined below, of the TDA7491HV are set by the two inputs STBY (pin 20) and MUTE (pin 21) as shown in [Table 7: Mode settings on page 33](#).

- Standby mode: all circuits are turned off, very low current consumption.
- Mute mode: inputs are connected to ground and the positive and negative PWM outputs are at 50% duty cycle.
- Play mode: the amplifiers are active.

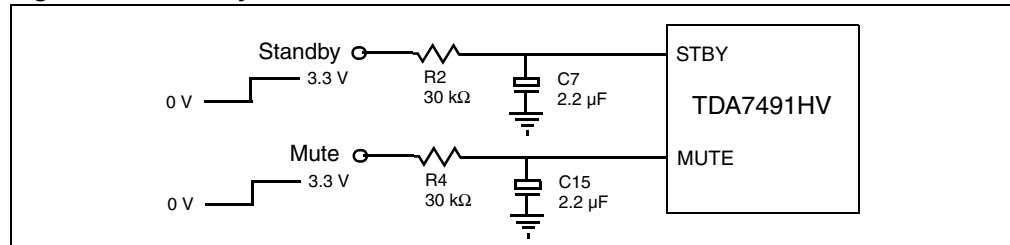

The protection functions of the TDA7491HV are implemented by pulling down the voltages of the STBY and MUTE inputs shown in [Figure 51](#). The input current of the corresponding pins must be limited to 200  $\mu$ A.

**Table 7. Mode settings**

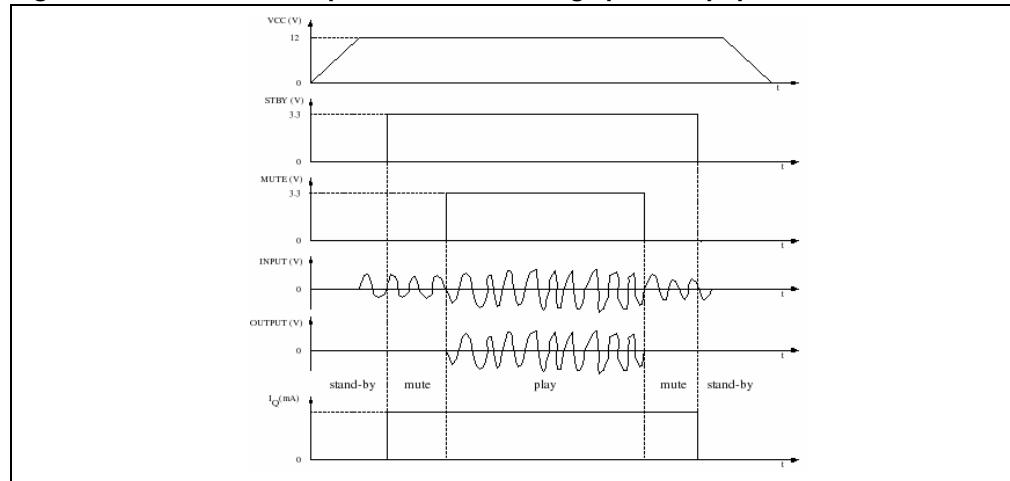

Mode	Voltage level on pin STBY	Voltage level on pin MUTE
Standby	L <sup>(1)</sup>	X (don't care)
Mute	H <sup>(1)</sup>	L
Play	H	H

1. refer to VSTBY and VMUTE in [Table 5: Electrical specifications on page 10](#)

**Figure 51. Standby and mute circuits**

**Figure 52. Turn-on/off sequence for minimizing speaker “pop”**

## 7.2 Gain setting

The gain of the TDA7491HV is set by the two inputs, GAIN0 (pin 30) and GAIN1 (pin 31). Internally, the gain is set by changing the feedback resistors of the amplifier.

**Table 8. Gain settings**

GAIN0	GAIN1	Nominal gain, $G_v$ (dB)
L(1)	H(1)	20
L	H	26
H	L	30
H	H	32

1. Refer to VinL and VinH in [Table 5: Electrical specifications on page 10](#) for drive levels for L and H

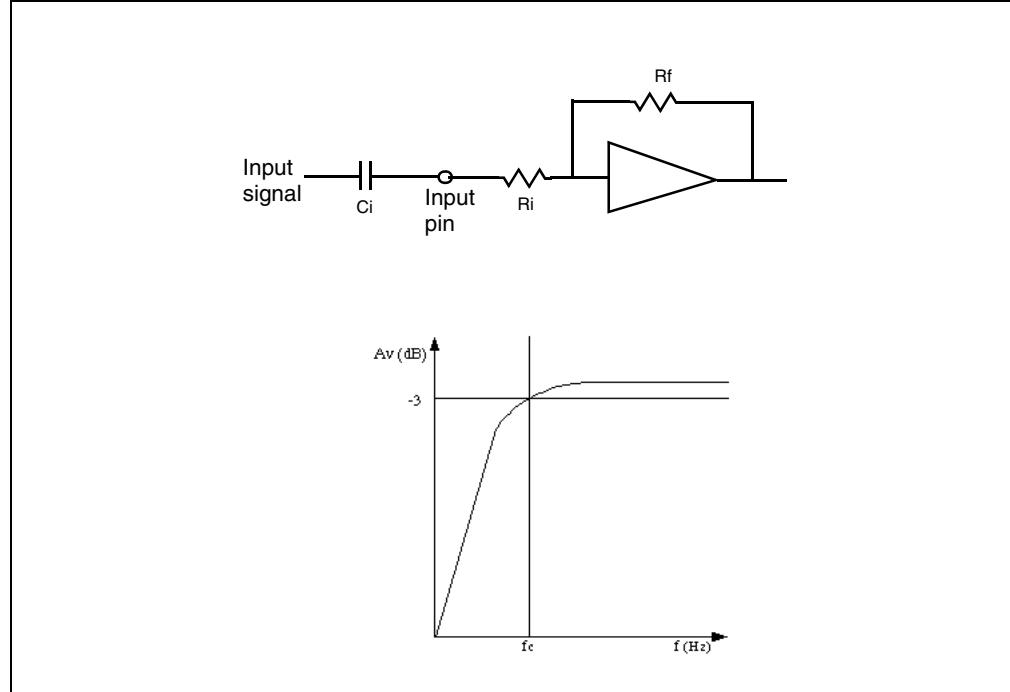

## 7.3 Input resistance and capacitance

The input impedance is set by an internal resistor  $R_i = 68 \text{ k}\Omega$  (typical). An input capacitor ( $C_i$ ) is required to couple the AC input signal.

The equivalent circuit and frequency response of the input components are shown in [Figure 53](#). For  $C_i = 220 \text{ nF}$  the high-pass filter cut-off frequency is below 20 Hz:

$$f_c = 1 / (2 * \pi * R_i * C_i)$$

**Figure 53. Device input circuit and frequency response**

## 7.4 Internal and external clocks

The clock of the class-D amplifier can be generated internally or can be driven by an external source.

If two or more class-D amplifiers are used in the same system, it is recommended that all devices operate at the same clock frequency. This can be implemented by using one TDA7491HV as master clock, while the other devices are in slave mode (that is, externally clocked. The clock interconnect is via pin SYNCLK of each device. As explained below, SYNCLK is an output in master mode and an input in slave mode.

### 7.4.1 Master mode (internal clock)

Using the internal oscillator, the output switching frequency,  $f_{SW}$ , is controlled by the resistor,  $R_{OSC}$ , connected to pin ROSC:

$$f_{SW} = 10^6 / ((16 * R_{OSC} + 182) * 4) \text{ kHz}$$

where  $R_{OSC}$  is in  $\text{k}\Omega$ .

In master mode, pin SYNCLK is used as a clock output pin, whose frequency is:

$$f_{SYNCLK} = 2 * f_{SW}$$

For master mode to operate correctly then resistor  $R_{OSC}$  must be less than  $60 \text{ k}\Omega$  as given below in [Table 9](#).

### 7.4.2 Slave mode (external clock)

In order to accept an external clock input the pin ROSC must be left open, that is, floating. This forces pin SYNCLK to be internally configured as an input as given in [Table 9](#).

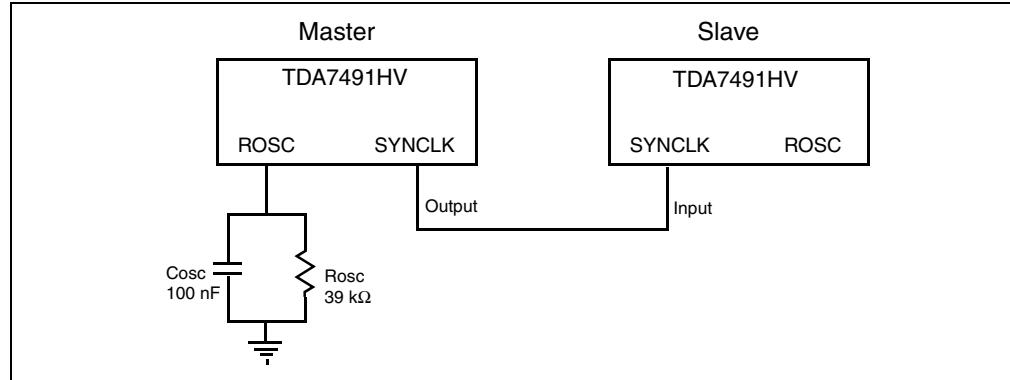

The output switching frequency of the slave devices is:

$$f_{SW} = f_{SYNCLK} / 2$$

**Table 9. How to set up SYNCLK**

Mode	ROSC	SYNCLK
Master	$R_{OSC} < 60 \text{ k}\Omega$	Output
Slave	Floating (not connected)	Input

**Figure 54. Master and slave connection**

## 7.5 Modulation

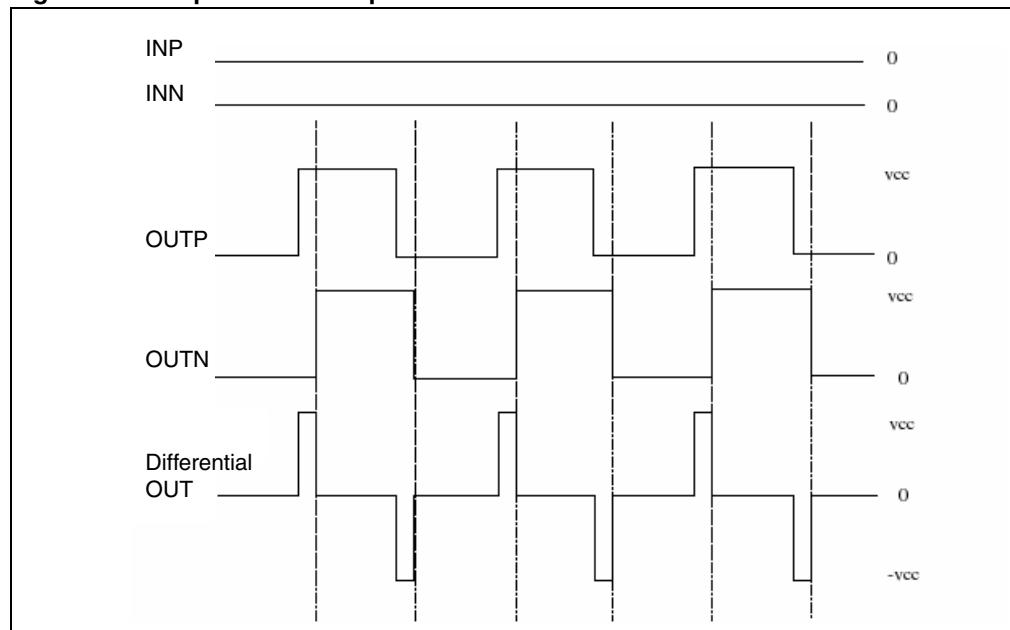

The output modulation scheme of the BTL is called unipolar pulse width modulation (PWM). The differential output voltages change between 0 V and  $+V_{CC}$  and between 0 V and  $-V_{CC}$ . This is in contrast to the traditional bipolar PWM outputs which change between  $+V_{CC}$  and  $-V_{CC}$ .

An advantage of this scheme is that it effectively doubles the switching frequency of the differential output waveform on the load then reducing the current ripple accordingly. The OUTP and OUTN are in the same phase almost overlapped when the input is zero under this condition, then the switching current is low and the related losses in the load are low.

In practice, a short delay is introduced between these two outputs in order to avoid the BTL output switching simultaneously when the input is zero.

Figure 55 shows the resulting differential output voltage and current when a positive, zero and negative input signal is applied. The resulting differential voltage on the load has a double frequency with respect to outputs OUTP and OUTN then resulting in reduced current ripple.

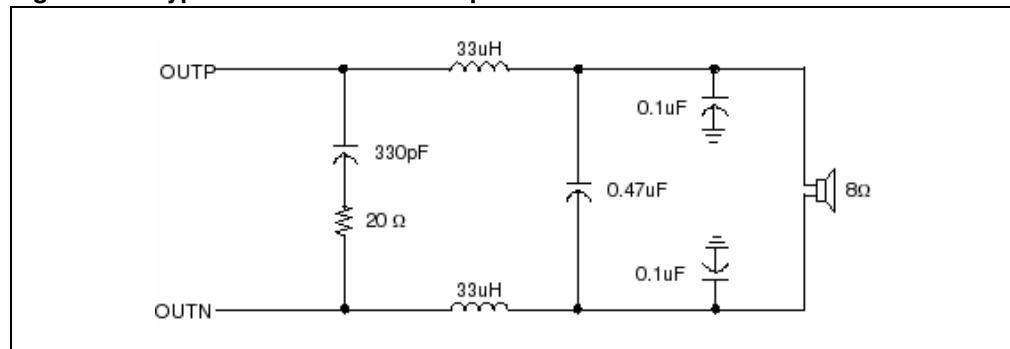

**Figure 55. Unipolar PWM output**

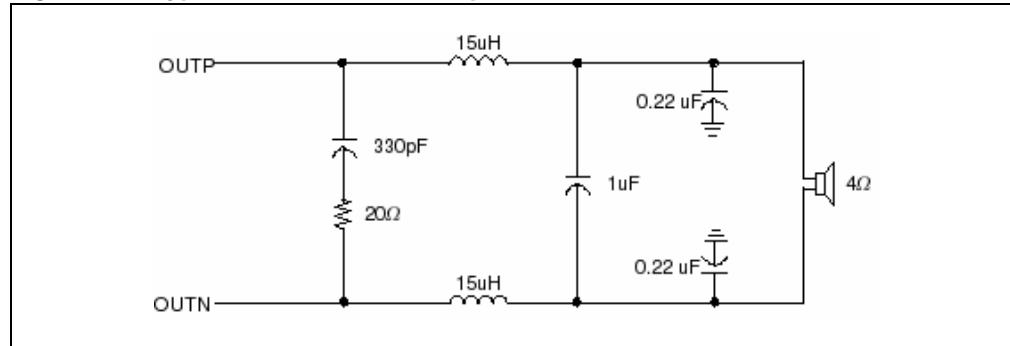

## 7.6 Reconstruction low-pass filter

Standard applications use a low-pass filter before the speaker. The cut-off frequency should be higher than 22 kHz and much lower than the output switching frequency. It is necessary to choose the L-C component values depending on the loud speaker impedance. Some typical values, which give a cut-off frequency of 27 kHz, are shown in [Figure 56](#) and [Figure 57](#) below.

**Figure 56.** Typical LC filter for a 8- $\Omega$  speaker

**Figure 57.** Typical LC filter for a 4- $\Omega$  speaker

## 7.7 Protection function

The TDA7491HV is fully protected against undervoltages, overcurrents and thermal overloads as explained here.

### Undervoltage protection (UVP)

If the supply voltage drops below the value of  $V_{UVP}$  given in [Table 5: Electrical specifications on page 10](#) the undervoltage protection is activated which forces the outputs to the high-impedance state. When the supply voltage recovers the device restarts.

### Overcurrent protection (OCP)

If the output current exceeds the value for  $I_{OCP}$  given in [Table 5: Electrical specifications on page 10](#) the overcurrent protection is activated which forces the outputs to the high-impedance state. Periodically, the device attempts to restart. If the overcurrent condition is still present then the OCP remains active. The restart time,  $T_{OC}$ , is determined by the R-C components connected to pin STBY.

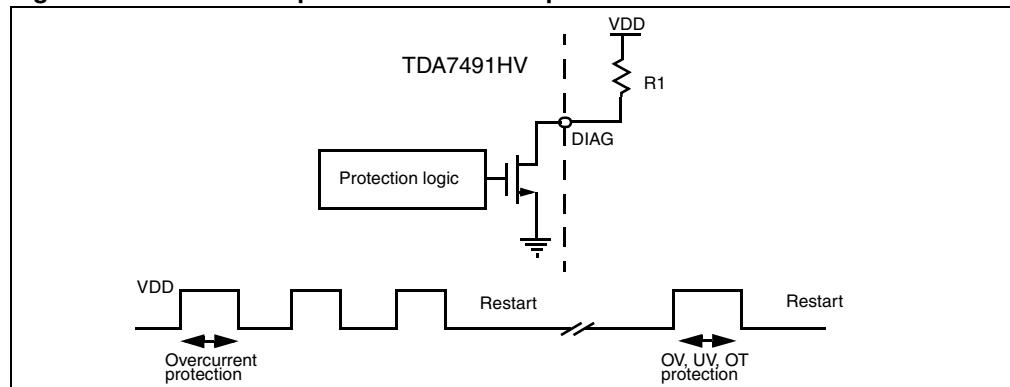

### Thermal protection (OTP)

If the junction temperature,  $T_j$ , reaches 145 °C (nominal), the device goes to mute mode and the positive and negative PWM outputs are forced to 50% duty cycle. If the junction temperature reaches the value for  $T_j$ , given in [Table 5: Electrical specifications on page 10](#) the device shuts down and the output is forced to the high impedance state. When the device cools sufficiently the device restarts.

## 7.8 Diagnostic output

The output pin DIAG is an open drain transistor. When the protection is activated it is in the high-impedance state. The pin can be connected to a power supply (<18 V) by a pull-up resistor whose value is limited by the maximum sinking current (200 µA) of the pin.

**Figure 58. Behavior of pin DIAG for various protection conditions**

## 7.9 Heatsink requirements

Due to the high efficiency of the class-D amplifier a 2-layer PCB can easily provide the heatsinking capability for low to medium power outputs.

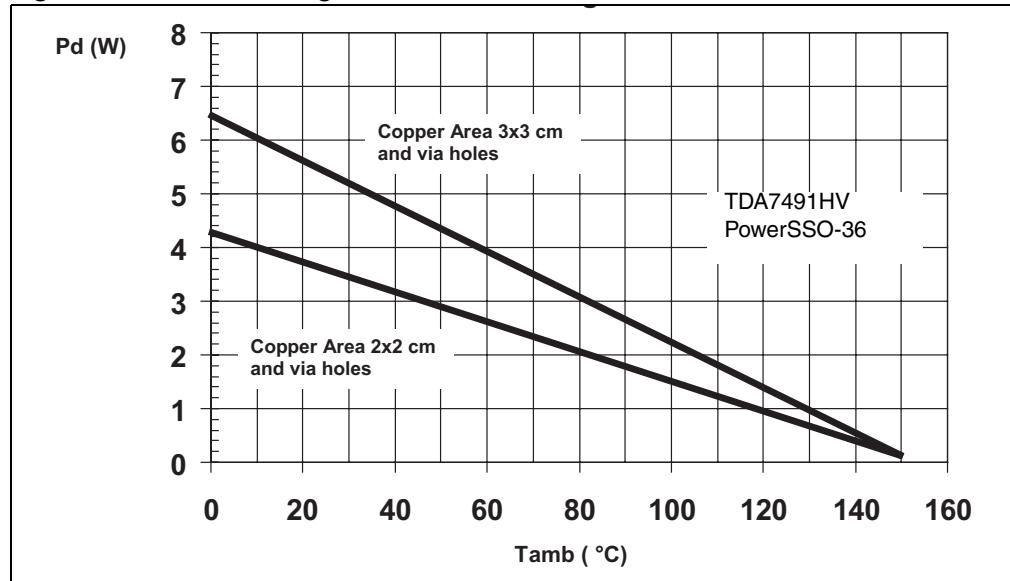

Using such a PCB with a copper ground layer of 3x3cm<sup>2</sup> and 16 vias connecting it to the contact area for the exposed pad, a thermal resistance , junction to ambient (in natural air convection), of 24 °C/W can be achieved.

The dissipated power within the device depends primarily on the supply voltage , load impedance and output modulation level. With the TDA7491HV driving 2x8Ω with a supply of 18V then the device dissipation is approximately 4W that gives with the above mentioned PCB a junction temperature increase of about 90°C.

With a musical program the dissipated power is about 40% less than the above maximum value. This leads to a junction temperature increase of around 60 °C. So even at the maximum recommended ambient temperature there is a margin of safety before the maximum junction temperature is reached.

*Figure 59* shows the derating curves for copper areas of 4 cm<sup>2</sup> and 9 cm<sup>2</sup>.

**Figure 59. Power derating curves for PCB used as heatsink**

## 8 Revision history

**Table 10. Document revision history**

Date	Revision	Changes
02-Jul-2007	1	Initial release.
03-Oct-2008	2	Updated AMR table Updated <a href="#">Chapter 4: Characterization curves on page 12</a> Added <a href="#">Figure 48: Test board (TDA7491HV) layout on page 29</a> Updated <a href="#">Figure 49: PowerSSO-36 EPD outline drawing on page 30</a> and <a href="#">Table 6: PowerSSO-36 EPD dimensions on page 31</a> Updated <a href="#">Figure 50: Applications circuit for class-D amplifier on page 32</a>
29-Jun-2009	3	Updated text concerning oscillator R and C in <a href="#">Section 3.3: Electrical specifications on page 10</a> Updated VOVP minimum value, added VUVP maximum value, updated STBY and MUTE voltages in <a href="#">Table 5: Electrical specifications on page 10</a> Updated equation for f <sub>SW</sub> <a href="#">on page 11</a> and <a href="#">on page 35</a> Updated <a href="#">Figure 50: Applications circuit for class-D amplifier on page 32</a>
03-Sep-2009	4	Added text for exposed pad in <a href="#">Figure 2 on page 8</a> Added text for exposed pad in <a href="#">Table 2 on page 9</a> Updated exposed pad Y (Min) dimension in <a href="#">Table 6 on page 31</a> Updated supply voltage for pin DIAG pull-up resistor in <a href="#">Section 7.8 on page 38</a> .
24-Mar-2011	5	Updated <a href="#">Features</a> Updated <a href="#">Section 3: Electrical specifications</a> Removed filterless operation Extended the temperature range to -40 to +85°C.

**Please Read Carefully:**

Information in this document is provided solely in connection with ST products. STMicroelectronics NV and its subsidiaries ("ST") reserve the right to make changes, corrections, modifications or improvements, to this document, and the products and services described herein at any time, without notice.

All ST products are sold pursuant to ST's terms and conditions of sale.

Purchasers are solely responsible for the choice, selection and use of the ST products and services described herein, and ST assumes no liability whatsoever relating to the choice, selection or use of the ST products and services described herein.

No license, express or implied, by estoppel or otherwise, to any intellectual property rights is granted under this document.
