OCTAL BUFFER/LINE DRIVER; 3-STATE; INVERTING

FEATURES

Output capability: bus driver

I_{CC} category: MSI

GENERAL DESCRIPTION

The 74HC/HCT240 are high-speed Si-gate CMOS devices and are pin compatible with low power Schottky TTL (LSTTL). They are specified in compliance with JEDEC standard no. 7A.

The 74HC/HCT240 are octal inverting buffer/line drivers with 3-state outputs. The 3-state outputs are controlled by the output enable inputs 10E and 20E. A HIGH on nOE causes the outputs to assume a high impedance OFF-state. The "240" is identical to the "244" but has inverting outputs.

Notes

1. CPD is used to determine the dynamic power dissipation (PD in $\mu W)$:

PD = CPD x VCC^2 x f_i + Σ (CL x VCC^2 x f_o) where:

f; = input frequency in MHz = output frequency in MHz C_L = output load capacitance in pF V_{CC} = supply voltage in V

 Σ (C_L x V_{CC}² x f₀) = sum of outputs

2. For HC the condition is V₁ = GND to V_CC
For HCT the condition is V₁ = GND to V_CC - 1.5 V

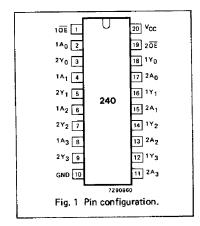

PACKAGE OUTLINES

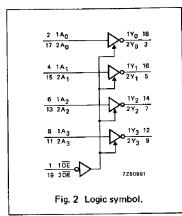

20-lead DIL; plastic (SOT146).

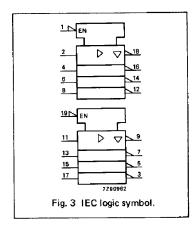

20-lead mini-pack; plastic (SO20; SOT163A).

Note to HCT types

The value of additional quiescent supply current (Δl_{CC}) for a unit load of 1 is given in the family specifications. To determine Δl_{CC} per input, multiply this value by the unit load coefficient shown in the table below.

input	unit load coefficient
1A _n	1.50
2A _n	1.50
10E	0.70
20E	0.70
