14-stage ripple-carry binary counter/divider and oscillator

HEF4060B
MSI

DESCRIPTION

The HEF4060B is a 14-stage ripple-carry binary counter/divider and oscillator with three oscillator terminals (RS, R_{TC} and C_{TC}), ten buffered outputs (O_3 to O_9 and O_{11} to O_{13}) and an overriding asynchronous master reset input (MR). The oscillator configuration allows design of either RC or crystal oscillator circuits. The oscillator may

be replaced by an external clock signal at input RS. The counter advances on the negative-going transition of RS. A HIGH level on MR resets the counter (O_3 to O_9 and O_{11} to O_{13} = LOW), independent of other input conditions.

Schmitt-trigger action in the clock input makes the circuit highly tolerant to slower clock rise and fall times.

Total power dissipation	5	$700\,f_{osc}\ +\ f_oC_LV_{DD}^2\ +\ 2C_tV_{DD}^2f_{osc}\ +\ \ \ \ 690\ \ V_{DD}$
when using the	10	$3\,300\,f_{osc}\ +\ f_oC_LV_{DD}^2\ +\ 2C_tV_{DD}^2f_{osc}\ +\ \ 6\,900\ \ V_{DD}$
on-chip oscillator (P)	15	$8\,900\,f_{osc}\ +\ f_oC_LV_{DD}^2\ +\ 2C_tV_{DD}^2f_{osc}\ +\ 22\,000\ \ V_{DD}$

Notes

1. where:

   f_i = input frequency (MHz)
   f_o = output frequency (MHz)

   C_L = load capacitance (pF)

   V_{DD} = supply voltage (V)

   C_t = timing capacitance (pF)

   f_{osc} = oscillator frequency (MHz)

RC oscillator

Typical formula for oscillator frequency:

$$f_{osc} = \frac{1}{2,3 \times R_t \times C_t}$$

Fig.4 External component connection for RC oscillator.

MSI

Timing component limitations

The oscillator frequency is mainly determined by $R_t C_t$, provided $R_t \ll R2$ and $R2C2 \ll R_t C_t$. The function of R2 is to minimize the influence of the forward voltage across the input protection diodes on the frequency. The stray capacitance C2 should be kept as small as possible. In consideration of accuracy, C_t must be larger than the inherent stray capacitance. R_t must be larger than the LOCMOS 'ON' resistance in series with it, which typically is 500 Ω at V_{DD} = 5 V, 300 Ω at V_{DD} = 10 V and 200 Ω at V_{DD} = 15 V.

The recommended values for these components to maintain agreement with the typical oscillation formula are:

$C_t \geq 100$ pF, up to any practical value,
10 k$\Omega \leq R_t \leq$ 1 MΩ.

Typical crystal oscillator circuit

In Fig.5, R2 is the power limiting resistor. For starting and maintaining oscillation a minimum transconductance is necessary.

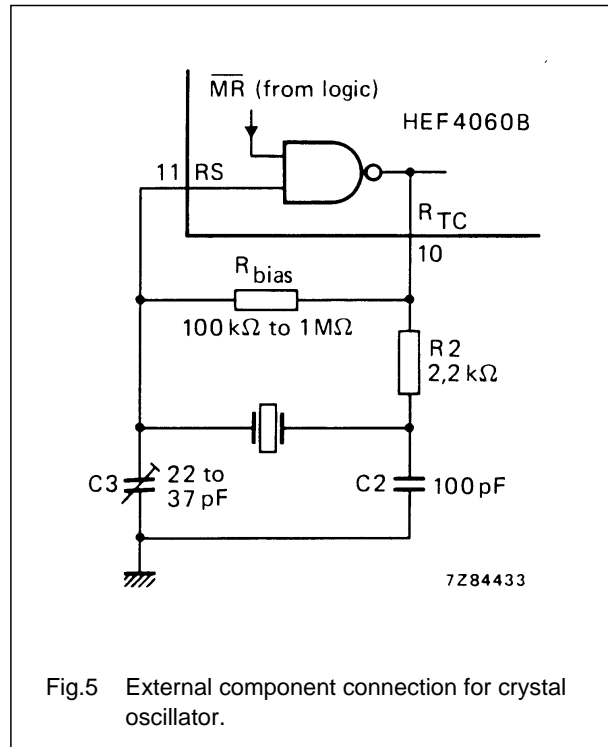

Fig.5   External component connection for crystal oscillator.

Fig.6   Test set-up for measuring forward transconductance g_{fs} = di_o/dv_i at v_o is constant (see also graph Fig.7); MR = LOW.
