

**MICROCHIP****PIC18F6XJXX/8XJXX**

Flash Microcontroller Programming Specification

1.0 DEVICE OVERVIEW

This document includes the programming specifications for the following devices:

- PIC18F67J10
- PIC18F66J15
- PIC18F66J10
- PIC18F65J90
- PIC18F65J15
- PIC18F65J11
- PIC18F65J10
- PIC18F64J90
- PIC18F64J11
- PIC18F63J90
- PIC18F63J11
- PIC18F87J10
- PIC18F86J15
- PIC18F86J10
- PIC18F85J90
- PIC18F85J15
- PIC18F85J11
- PIC18F85J10
- PIC18F84J90
- PIC18F84J11
- PIC18F83J90
- PIC18F83J11

2.0 PROGRAMMING OVERVIEW OF THE PIC18F6XJXX/8XJXX

The PIC18F6XJXX/8XJXX devices are programmed using In-Circuit Serial Programming™ (ICSP™). This programming specification applies to PIC18F6XJXX/8XJXX devices in all package types.

2.1 Pin Diagrams

The pin diagrams for the PIC18F6XJXX/8XJXX are shown in Figure 2-1 and Figure 2-2. The pins that are required for programming are listed in Table 2-1 and shown in darker lettering in the figures.

TABLE 2-1: PIN DESCRIPTIONS (DURING PROGRAMMING): PIC18F6XJXX/8XJXX

Pin Name	During Programming		
	Pin Name	Pin Type	Pin Description
MCLR	MCLR	P	Programming Enable
VDD and AVDD ⁽¹⁾	VDD	P	Power Supply
Vss and AVss ⁽¹⁾	Vss	P	Ground
ENVREG	ENVREG	P	Internal Voltage Regulator Enable
VDDCORE/VCAP	VDDCORE	P	Regulated Power Supply for Microcontroller Core
	VCAP	I	Filter Capacitor for On-Chip Voltage Regulator
RB6	PGC	I	Serial Clock
RB7	PGD	I/O	Serial Data

Legend: I = Input, O = Output, P = Power

Note 1: All power supply and ground pins must be connected, including analog supplies (AVDD) and ground (AVss).

PIC18F6XJXX/8XJXX

FIGURE 2-1: PIC18F6XJXX PIN DIAGRAMS

64-Pin TQFP

The following devices are included in 64-pin TQFP parts:

- PIC18F67J10
- PIC18F66J15
- PIC18F66J10
- PIC18F65J90
- PIC18F65J15
- PIC18F65J11
- PIC18F65J10
- PIC18F65J10
- PIC18F64J90
- PIC18F64J11
- PIC18F63J90
- PIC18F63J11

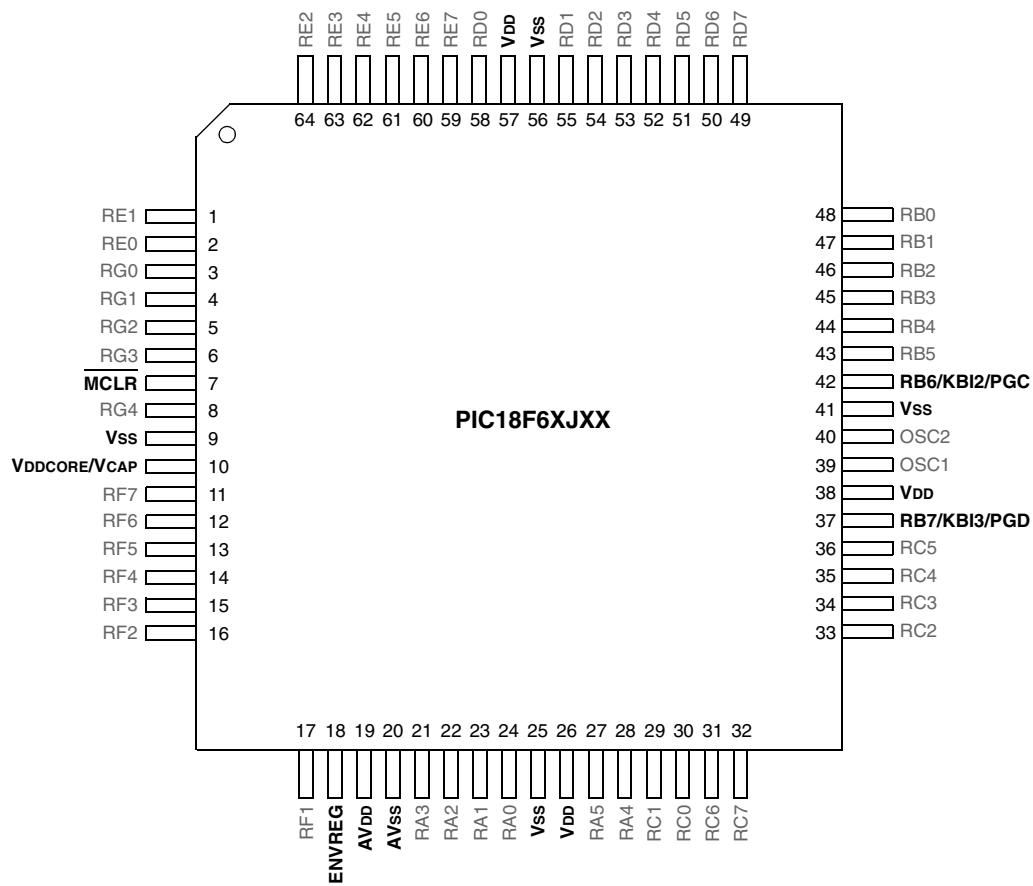

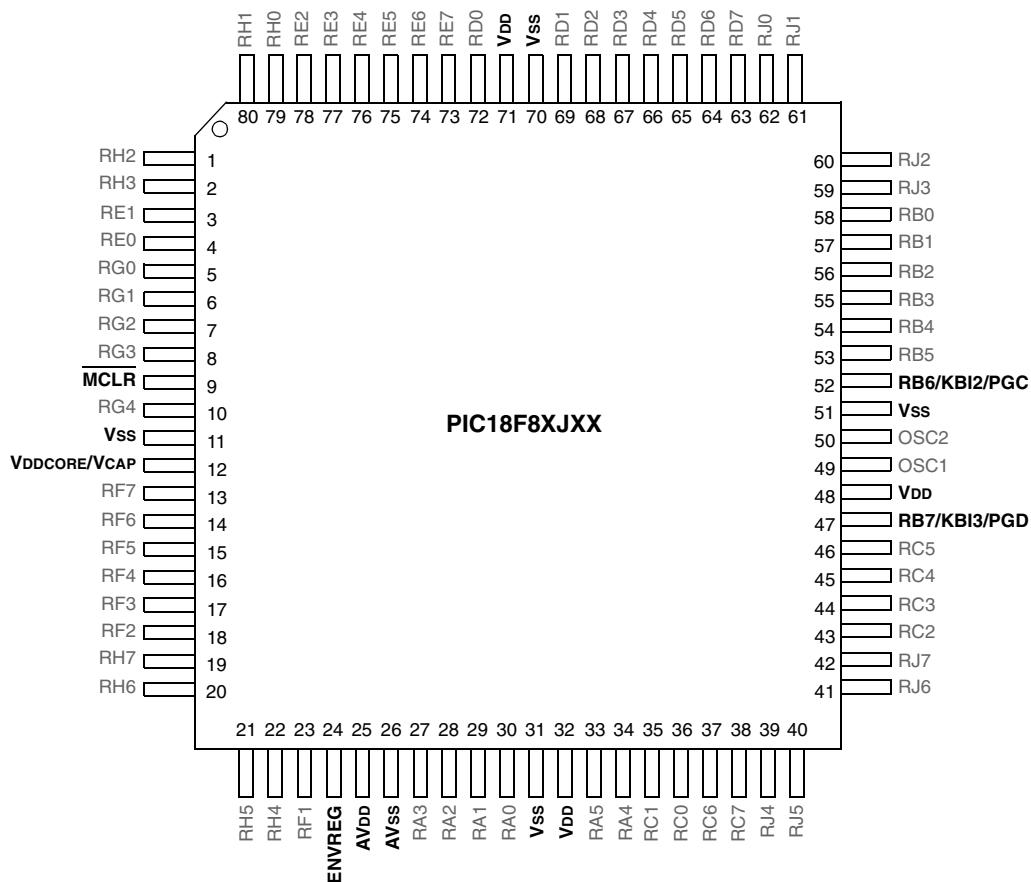

FIGURE 2-2: PIC18F8XJXX PIN DIAGRAMS

80-Pin TQFP

The following devices are included in 80-pin TQFP parts:

- PIC18F87J10
- PIC18F86J15
- PIC18F86J10
- PIC18F85J90
- PIC18F85J15
- PIC18F85J11
- PIC18F85J10
- PIC18F84J11
- PIC18F83J90
- PIC18F83J11
- PIC18F84J90

PIC18F6XJXX/8XJXX

2.1.1 ON-CHIP VOLTAGE REGULATOR

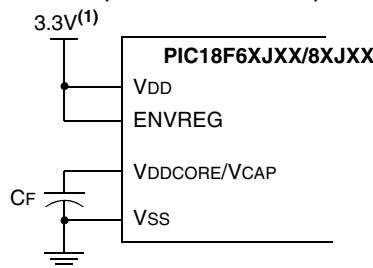

All of the PIC18F6XJXX/8XJXX devices have dual power requirements. The microcontroller core can be powered from an external source that is separate from VDD, or it can be powered from an on-chip regulator which derives power from VDD. Both sources use the common VDDCORE/VCAP pin.

The regulator is enabled by connecting VDD to the ENVREG pin. In this case, a low ESR capacitor must be connected to the VDDCORE/VCAP pin for proper device operation. If the regulator is disabled by connecting Vss to the ENVREG pin, power to the core must be supplied on VDDCORE/VCAP. Whether or not the regulator is used, it is always good design practice to have sufficient capacitance on all supply pins. Examples are shown in Figure 2-3.

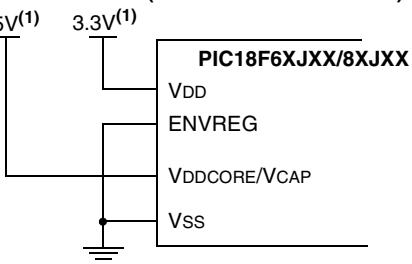

The specifications for core voltage and capacitance are listed in **Section 6.0 “AC/DC Characteristics and Timing Requirements for Program/Verify Test Mode”**.

FIGURE 2-3: CONNECTIONS FOR THE ON-CHIP REGULATOR

Regulator Enabled (ENVREG tied to VDD):

Regulator Disabled (ENVREG tied to Ground):

Note 1: These are typical operating voltages. Refer to **Section 6.0 “AC/DC Characteristics and Timing Requirements for Program/Verify Test Mode”**.

2.2 Memory Maps

The PIC18F6XJXX/8XJXX devices offer a total of eight program memory sizes, ranging from 8 Kbytes to 128 Kbytes. The memory sizes for different members of the family are shown in Table 2-2. The overall memory maps for all devices are shown in Figure 2-4.

For purposes of code protection, the program memory for every device is treated as a single block. Enabling code protection thus protects the entire code memory and not individual segments.

The Configuration Words for these devices are located at addresses 300000h through 300005h. These are implemented as three pairs of volatile memory registers. 300006h-300007h are reserved for a fourth pair of Configuration registers that are not implemented in PIC18F6XJXX/8XJXX devices. Each register is automatically loaded from a copy stored at the end of program memory. For this reason, the top four words of the code space (also called the Flash Configuration Words) should be written with configuration data and not executable code. The addresses of the Flash Configuration Words are also listed in Table 2-2. Refer to section **Section 5.0 “Configuration Word”** for more information.

Locations 3FFFFEh and 3FFFFFFh are reserved for the Device ID bits. These bits may be used by the programmer to identify what device type is being programmed and are described in **Section 5.1 “Device ID Word”**. These Device ID bits read out normally, even after code protection.

TABLE 2-2: PROGRAM MEMORY SIZES FOR PIC18F6XJXX/8XJXX DEVICES

Device	Program Memory (Kbytes)	Location of Flash Configuration Words
PIC18F63J11	8	1FF8h:1FFFh
PIC18F63J90		
PIC18F83J11		
PIC18F83J90		
PIC18F64J11	16	3FF8h:3FFFh
PIC18F64J90		
PIC18F84J11		
PIC18F84J90		
PIC18F65J10	32	7FF8h:7FFFh
PIC18F65J11		
PIC18F65J90		
PIC18F85J10		
PIC18F85J11		
PIC18F85J90	48	BFF8h:BFFFh
PIC18F65J15		
PIC18F85J15		
PIC18F66J10	64	FFF8h:FFFFh
PIC18F86J10		
PIC18F66J15	96	17FF8h:17FFFh
PIC18F86J15		
PIC18F67J10	128	1FFF8h:1fFFFh
PIC18F87J10		

2.2.1 MEMORY ADDRESS POINTER

Memory in the device address space (000000h to 3FFFFFFh) is addressed via the Table Pointer register, which in turn is comprised of three registers:

- TBLPTRU at RAM address 0FF8h
- TBLPTRH at RAM address 0FF7h
- TBLPTRL at RAM address 0FF6h

TBLPTRU	TBLPTRH	TBLPTRL
Addr[21:16]	Addr[15:8]	Addr[7:0]

The 4-bit command, ‘0000’ (core instruction), is used to load the Table Pointer prior to using many read or write operations.

PIC18F6XJXX/8XJXX

FIGURE 2-4: MEMORY MAPS FOR PIC18FXXJ10/XXJ15 DEVICES⁽¹⁾

PIC18F6XJXX/8XJXX

2.3 Overview of the Programming Process

Figure 2-6 shows the high-level overview of the programming process. First, a Bulk Erase is performed. Next, the code memory is programmed. Since the only nonvolatile Configuration Words are within the code memory space, they too are programmed as if they were code. Code memory (including the Configuration Words) is then verified to ensure that programming was successful.

Note: In order to maintain the endurance of the cells, each Flash byte should not be programmed more than twice between erase operations. A Bulk Erase of the device is required before attempting to modify the contents a third time.

FIGURE 2-6: HIGH-LEVEL PROGRAMMING FLOW

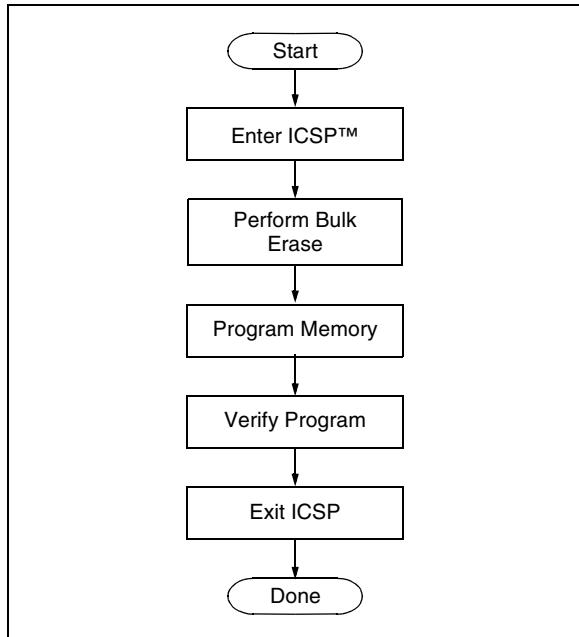

FIGURE 2-7: ENTERING PROGRAM/VERIFY MODE

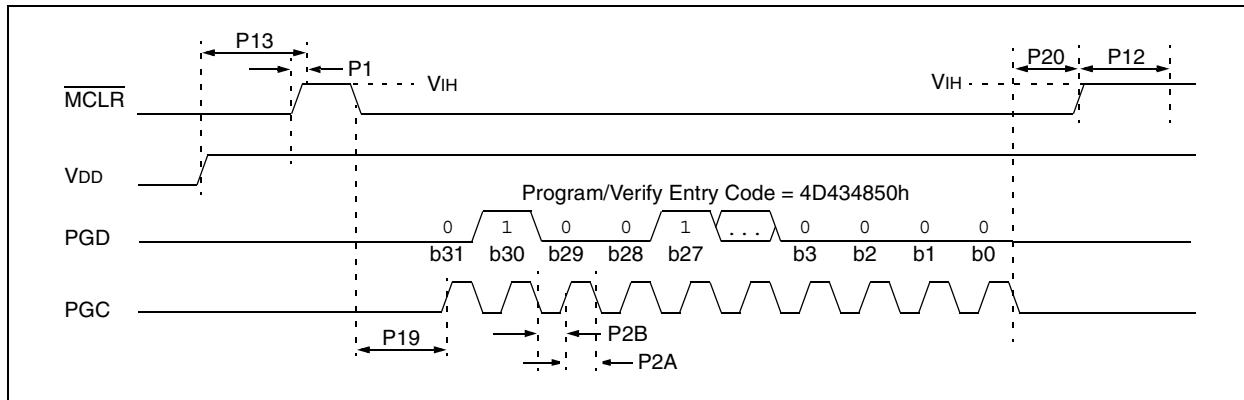

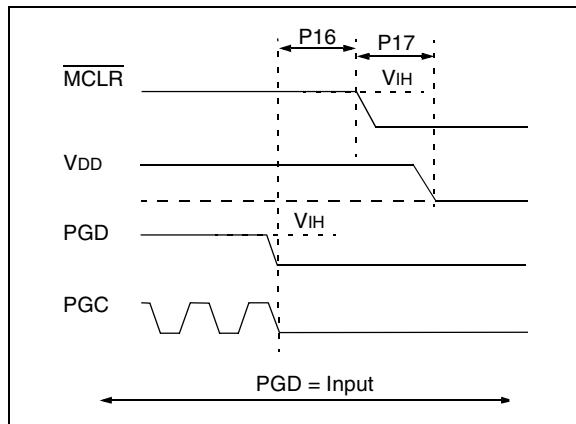

FIGURE 2-8: EXITING PROGRAM/VERIFY MODE

2.5 Serial Program/Verify Operation

The PGC pin is used as a clock input pin and the PGD pin is used for entering command bits and data input/output during serial operation. Commands and data are transmitted on the rising edge of PGC, latched on the falling edge of PGC and are Least Significant bit (LSb) first.

2.5.1 4-BIT COMMANDS

All instructions are 20 bits, consisting of a leading 4-bit command followed by a 16-bit operand, which depends on the type of command being executed. To input a command, PGC is cycled four times. The commands needed for programming and verification are shown in Table 2-3.

Depending on the 4-bit command, the 16-bit operand represents 16 bits of input data, or 8 bits of input data and 8 bits of output data.

Throughout this specification, commands and data are presented as illustrated in Table 2-4. The 4-bit command is shown Most Significant bit (MSb) first. The command operand, or “Data Payload”, is shown <MSB><LSB>. Figure 2-9 demonstrates how to serially present a 20-bit command/operand to the device.

2.5.2 CORE INSTRUCTION

The core instruction passes a 16-bit instruction to the CPU core for execution. This is needed to set up registers as appropriate for use with other commands.

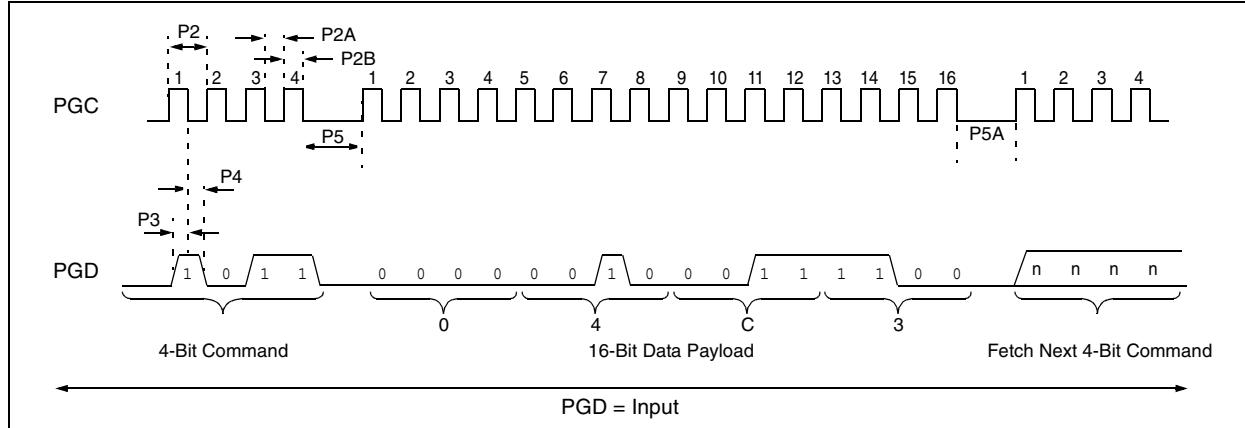

TABLE 2-3: COMMANDS FOR PROGRAMMING

Description	4-Bit Command
Core Instruction (Shift in 16-bit instruction)	0000
Shift out TABLAT register	0010
Table Read	1000
Table Read, post-increment	1001
Table Read, post-decrement	1010
Table Read, pre-increment	1011
Table Write	1100
Table Write, post-increment by 2	1101
Table Write, start programming, post-increment by 2	1110
Table Write, start programming	1111

1101	3C 40	Table Write, post-increment by 2

FIGURE 2-9: TABLE WRITE, POST-INCREMENT TIMING (1101)

PIC18F6XJXX/8XJXX

3.0 DEVICE PROGRAMMING

Programming includes the ability to erase or write the memory within the device.

The EECON1 register is used to control Write or Row Erase operations. The WREN bit (EECON1<2>) must be set to enable writes and this must be done prior to initiating a write sequence. It is strongly recommended that the WREN bit only be set immediately prior to a Program Erase.

Note: The EECON1 register is available only in ICSP Programming mode. In normal operating modes, the corresponding SFR location (FA6h) is unimplemented. Writes to the register during code execution will have no effect; reading the location will return '0's.

3.1 ICSP Erase

3.1.1 ICSP BULK ERASE

The PIC18F6XJXX/8XJXX devices may be Bulk Erased by writing 0180h to the register pair, 3C0005h:3C0004h. The basic sequence is shown in Table 3-1 and demonstrated in Figure 3-1.

Since the code-protect Configuration bit is stored in the program code within code memory, a Bulk Erase operation will also clear any code-protect settings for the device.

The actual Bulk Erase function is a self-timed operation. Once the erase has started (falling edge of the 4th PGC after the NOP command), serial execution will cease until the erase completes (parameter P11). During this time, PGC may continue to toggle but PGD must be held low.

Note: A Bulk Erase is the only way to reprogram the code-protect Configuration bit from an ON state to an OFF state.

TABLE 3-1: BULK ERASE COMMAND SEQUENCE

4-Bit Command	Data Payload	Core Instruction
0000	0E 3C	MOVWL 3Ch
0000	6E F8	MOVWF TBLPTRU
0000	0E 00	MOVWL 00h
0000	6E F7	MOVWF TBLPTRH
0000	0E 05	MOVWL 05h
0000	6E F6	MOVWF TBLPTRL
1100	01 01	Write 01h to 3C0005h
0000	0E 3C	MOVWL 3Ch
0000	6E F8	MOVWF TBLPTRU
0000	0E 00	MOVWL 00h
0000	6E F7	MOVWF TBLPTRH
0000	0E 04	MOVWL 04h
0000	6E F6	MOVWF TBLPTRL
1100	80 80	Write 80h TO 3C0004h to erase entire device.
0000	00 00	NOP
0000	00 00	Hold PGD low until erase completes.

FIGURE 3-1: BULK ERASE FLOW

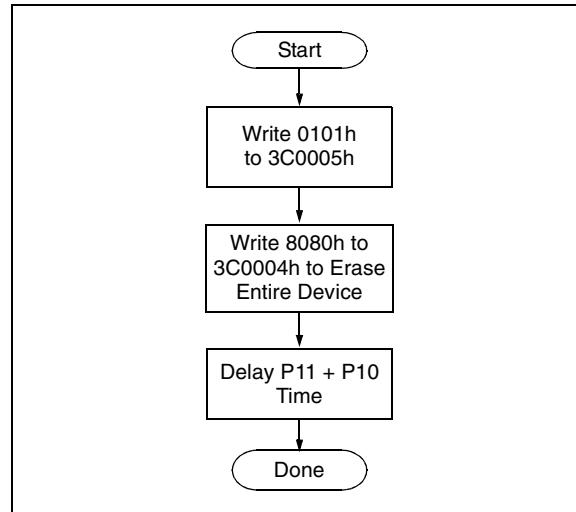

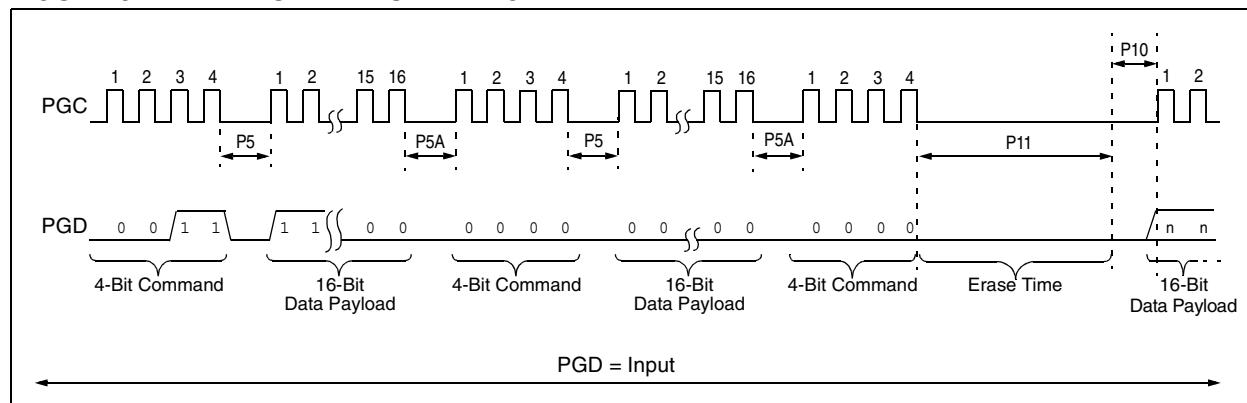

FIGURE 3-2: BULK ERASE TIMING

3.2 Code Memory Programming

Programming code memory is accomplished by first loading data into the write buffer and then initiating a programming sequence. The write buffer for all PIC18F6XJXX/8XJXX devices is 64 bytes. It can be mapped to any location of the same size beginning at 000000h. The actual memory write sequence takes the contents of this buffer and programs the proper amount of code memory that contains the Table Pointer.

Write buffer locations are not cleared following a write operation. The buffer retains its data after the write is complete. This means that the buffer must be written with 64 bytes on each operation. If there are locations in the code memory that are to remain empty, the corresponding locations in the buffer must be filled with FFFFh. This avoids rewriting old data from the previous cycle.

The programming duration is externally timed and is controlled by PGC. After a Start Programming command is issued (4-bit command, '1111'), a NOP is issued, where the 4th PGC is held high for the duration of the programming time, P9.

After PGC is brought low, the programming sequence is terminated. PGC must be held low for the time specified by parameter P10 to allow high-voltage discharge of the memory array.

The code sequence to program a PIC18F6XJXX/8XJXX device is shown in Table 3-2. The flowchart shown in Figure 3-3 depicts the logic necessary to completely write a PIC18F6XJXX/8XJXX device. The timing diagram that details the Start Programming command and parameters P9 and P10 is shown in Figure 3-4.

Note: The TBLPTR register must point to the same region when initiating the programming sequence as it did when the write buffers were loaded.

TABLE 3-2: WRITE CODE MEMORY CODE SEQUENCE

4-Bit Command	Data Payload	Core Instruction
Step 1: Enable writes.		
0000	84 A6	BSF EECON1, WREN
Step 2: Load write buffer.		
0000	0E <Addr[21:16]>	MOVLW <Addr[21:16]>
0000	6E F8	MOVWF TBLPTRU
0000	0E <Addr[15:8]>	MOVLW <Addr[15:8]>
0000	6E F7	MOVWF TBLPTRH
0000	0E <Addr[7:0]>	MOVLW <Addr[7:0]>
0000	6E F6	MOVWF TBLPTRL
Step 3: Repeat for all but the last two bytes. Any unused locations should be filled with FFFFh.		
1101	<MSB><LSB>	Write 2 bytes and post-increment address by 2.
Step 4: Load write buffer for last two bytes.		
1111	<MSB><LSB>	Write 2 bytes and start programming.
0000	00 00	NOP - hold PGC high for time P9 and low for time P10.
To continue writing data, repeat steps 2 through 4, where the Address Pointer is incremented by 2 at each iteration of the loop.		

PIC18F6XJXX/8XJXX

FIGURE 3-3: PROGRAM CODE MEMORY FLOW

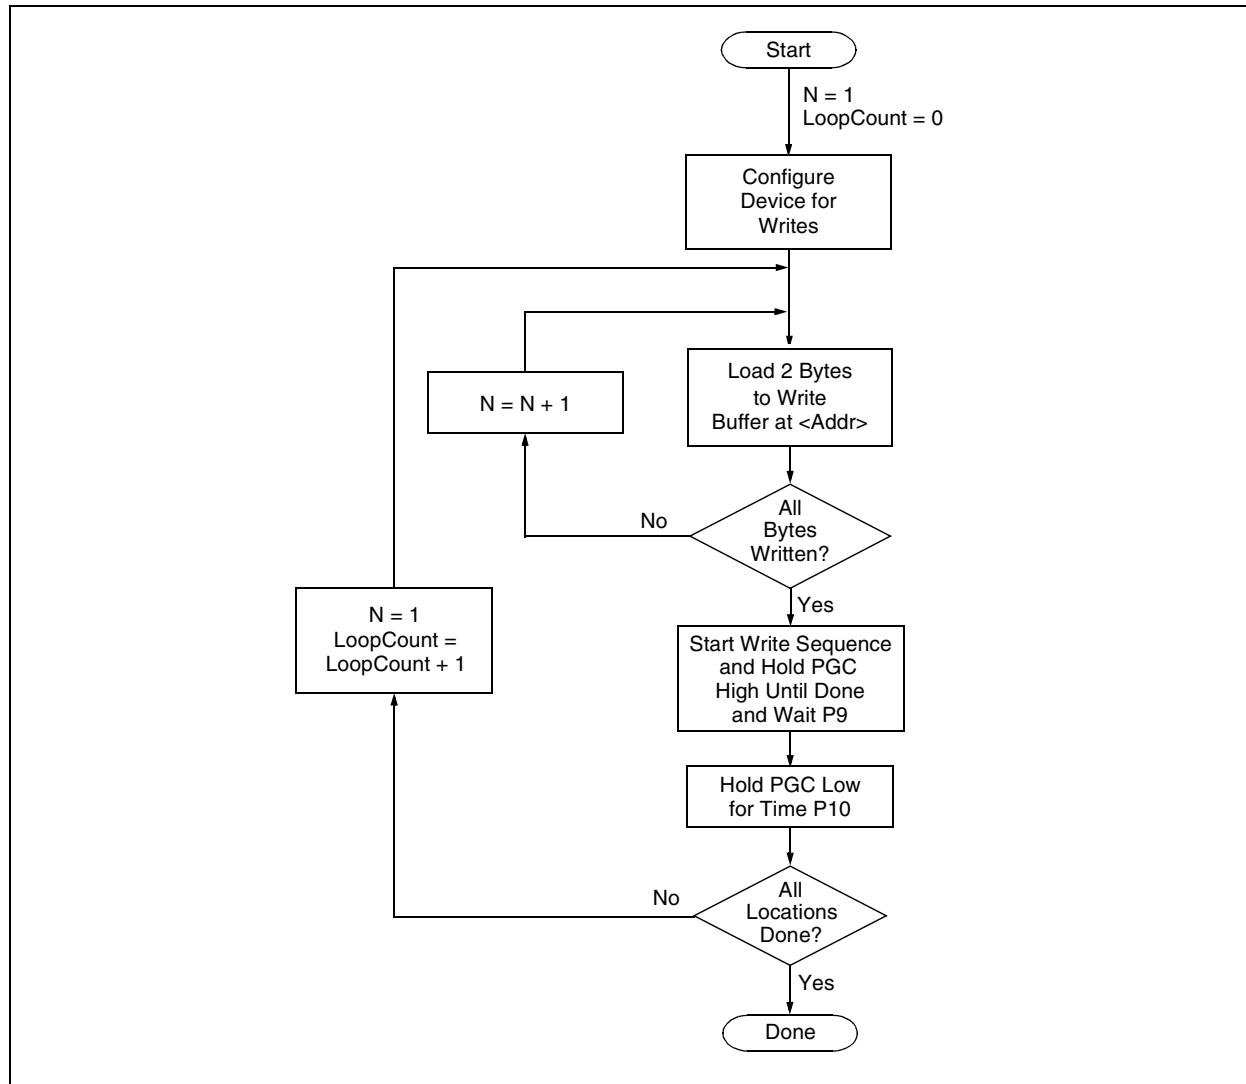

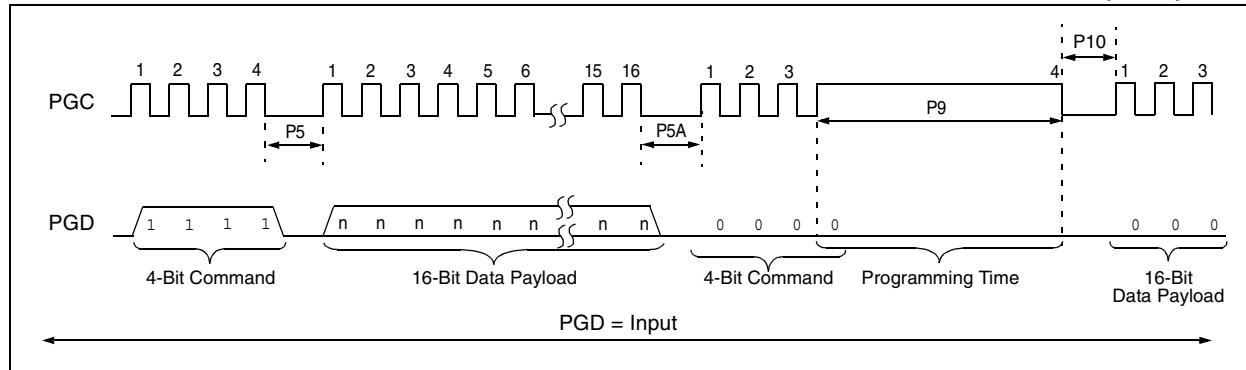

FIGURE 3-4: TABLE WRITE AND START PROGRAMMING INSTRUCTION TIMING (1111)

3.2.1 MODIFYING CODE MEMORY

The previous programming example assumed that the device had been Bulk Erased prior to programming. There may be situations where the user wishes to modify a section of memory in an already programmed device. Doing this is simply an extension of the three basic operations: read, erase and write.

Before a Bulk Erase is performed on the device, the entire code memory is read back (as described in **Section 4.2 “Verify Code Memory and Configuration Word”**) and buffered. It is at this point that the required changes are made on the buffered program. The device is then erased and reprogrammed with the corrected code. An overview of the process is shown in Table 3-3.

3.2.2 CONFIGURATION WORD PROGRAMMING

Since the Flash Configuration Words are stored in program memory, they are programmed as if they were program data. Refer to **Section 3.2 “Code Memory Programming”** and **Section 3.2.1 “Modifying Code Memory”** for methods and examples on programming or modifying program memory. See also **Section 5.0 “Configuration Word”** for additional information on the Configuration Words.

TABLE 3-3: MODIFYING CODE MEMORY

4-Bit Command	Data Payload	Core Instruction
Step 1: Direct access to code memory.		
Step 2: Read and modify code memory (see Section 4.1 “Read Code Memory”).		
Step 3: Perform a Bulk Erase (see Section 3.1.1 “ICSP Bulk Erase”).		
Step 4: Enable memory writes.		
0000	84 A6	BSF EECON1, WREN
Step 5: Load write buffer. The correct bytes will be selected based on the Table Pointer.		
0000	0E <Addr[21:16]>	MOVLW <Addr[21:16]>
0000	6E F8	MOVWF TBLPTRU
0000	0E <Addr[8:15]>	MOVLW <Addr[8:15]>
0000	6E F7	MOVWF TBLPTRH
0000	0E <Addr[7:0]>	MOVLW <Addr[7:0]>
0000	6E F6	MOVWF TBLPTRL
1101	<MSB><LSB>	Write 2 bytes and post-increment address by 2.
.	.	Repeat as many times as necessary to fill the write buffer.
.	.	
1111	<MSB><LSB>	Write 2 bytes and start programming.
0000	00 00	NOP - hold PGC high for time P9 and low for time P10.
To continue modifying data, repeat Step 5, where the Address Pointer is incremented by the appropriate number of bytes at each iteration of the loop. The write cycle must be repeated enough times to completely rewrite the contents of the program memory.		
Step 7: Disable writes.		
0000	94 A6	BCF EECON1, WREN

PIC18F6XJXX/8XJXX

4.0 READING THE DEVICE

4.1 Read Code Memory

Code memory is accessed one byte at a time via the 4-bit command, '1001' (table read, post-increment). The contents of memory pointed to by the Table Pointer (TBLPTRU:TBLPTRH:TBLPTRL) are serially output on PGD.

The 4-bit command is shifted in LSb first. The read is executed during the next 8 clocks, then shifted out on PGD during the last 8 clocks, LSb to MSb. A delay of

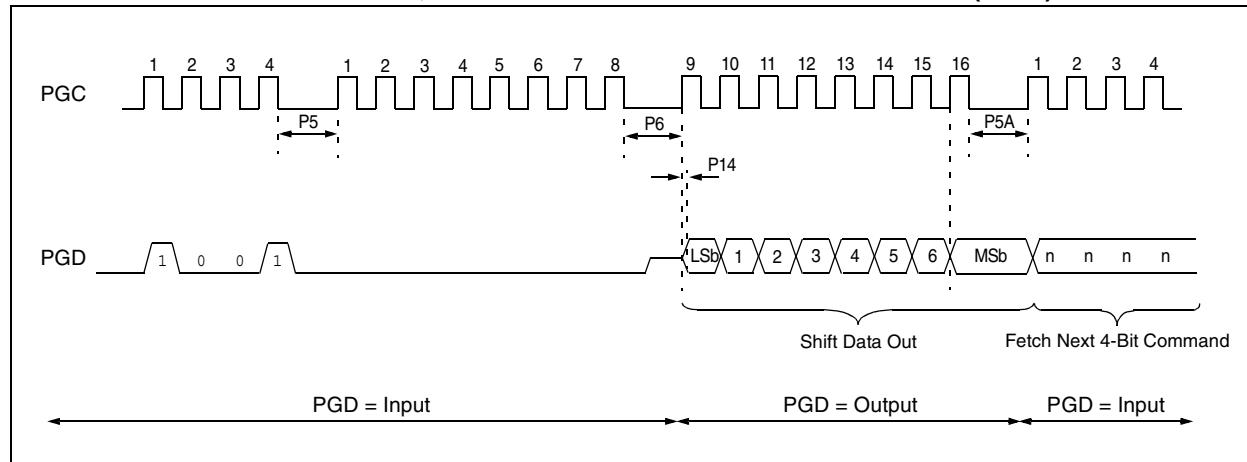

P6 must be introduced after the falling edge of the 8th PGC of the operand to allow PGD to transition from an input to an output. During this time, PGC must be held low (see Figure 4-1). This operation also increments the Table Pointer by one, pointing to the next byte in code memory for the next read.

This technique will work to read any memory in the 000000h to 3FFFFFh address space, so it also applies to reading the Configuration registers.

TABLE 4-1: READ CODE MEMORY SEQUENCE

4-Bit Command	Data Payload	Core Instruction
Step 1: Set Table Pointer.		
0000	0E <Addr [21:16] >	MOVLW Addr [21:16]
0000	6E F8	MOVWF TBLPTRU
0000	0E <Addr [15:8] >	MOVLW <Addr [15:8] >
0000	6E F7	MOVWF TBLPTRH
0000	0E <Addr [7:0] >	MOVLW <Addr [7:0] >
0000	6E F6	MOVWF TBLPTRL
Step 2: Read memory and then shift out on PGD, LSb to MSb.		
1001	00 00	TBLRD *+

FIGURE 4-1: TABLE READ, POST-INCREMENT INSTRUCTION TIMING (1001)

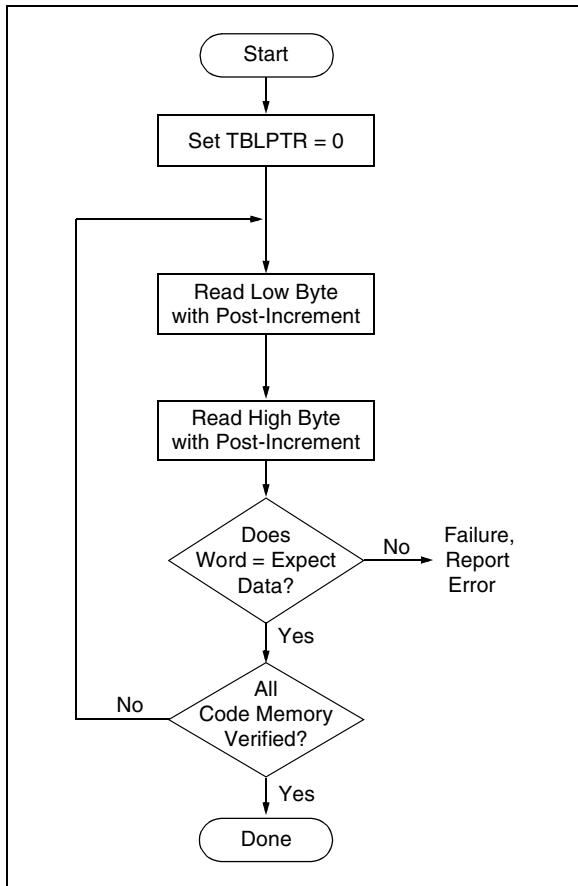

4.2 Verify Code Memory and Configuration Word

The verify step involves reading back the code memory space and comparing it against the copy held in the programmer's buffer. Because the Flash Configuration Words are stored in the top of program memory, it is verified with the rest of the code at this time.

The verify process is shown in the flowchart in Figure 4-2. Memory reads occur a single byte at a time, so two bytes must be read to compare against the word in the programmer's buffer. Refer to **Section 4.1 “Read Code Memory”** for implementation details of reading code memory.

Note: Because the Flash Configuration Word contains the device code protection bit, code memory should be verified immediately after writing if code protection is enabled. This is because the device will not be readable or verifiable if a device Reset occurs after the Flash Configuration Word (and the CP0 bit) have been cleared.

FIGURE 4-2: VERIFY CODE MEMORY FLOW

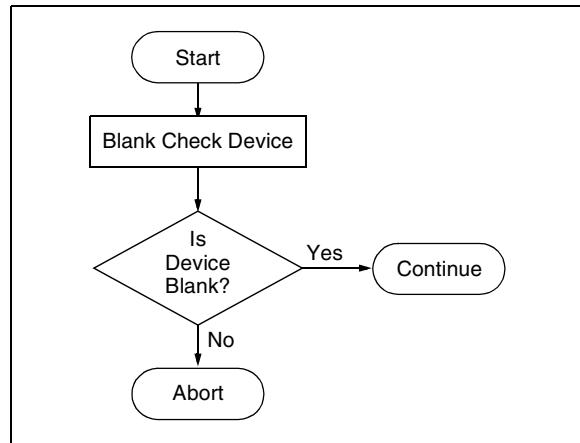

4.3 Blank Check

The term “Blank Check” means to verify that the device has no programmed memory cells. All memories must be verified: code memory and Configuration bits. The Device ID registers (3FFFFEh:3FFFFFh) should be ignored.

A “blank” or “erased” memory cell will read as ‘1’, so Blank Checking a device merely means to verify that all bytes read as FFh. The overall process flow is shown in Figure 4-3.

Given that Blank Checking is merely code verification with FFh expect data, refer to **Section 4.2 “Verify Code Memory and Configuration Word”** for implementation details.

FIGURE 4-3: BLANK CHECK FLOW

PIC18F6XJXX/8XJXX

5.0 CONFIGURATION WORD

The Configuration Words of the PIC18F6XJXX/8XJXX devices are implemented as volatile memory registers, as opposed to the programmable nonvolatile memory used in other PIC18 devices. All of the Configuration registers (CONFIG1L, CONFIG1H, CONFIG2L, CONFIG2H, CONFIG3L and CONFIG3H) are automatically loaded following each device Reset.

The data for these registers is taken from the four Flash Configuration Words located at the top of program memory. Configuration data is stored in order, starting with CONFIG1L in the lowest Flash address and ending with CONFIG4H in the highest. The mapping to specific Configuration Words is shown in Table 5-1. While four words are reserved in program memory, only three words (CONFIG1L through CONFIG3H) are used for device configuration. Users should always reserve these locations for Configuration Word data and write their application code accordingly.

The upper four bits of each Configuration Word should always be stored in program memory as '1111'. This is done so these program memory addresses will always be '1111 xxxx xxxx xxxx' and interpreted as a NOP instruction if they were ever to be executed. Because the corresponding bits in the Configuration Word are unimplemented, they will not be written to.

The Configuration and Device ID registers are summarized in Table 5-2. A listing of the individual Configuration bits and their options is provided in Table 5-3.

TABLE 5-1: MAPPING OF THE FLASH CONFIGURATION WORDS TO THE CONFIGURATION REGISTERS

Configuration Byte	Code Space Address ⁽¹⁾	Configuration Register Address
CONFIG1L	XXXF8h	300000h
CONFIG1H	XXXF9h	300001h
CONFIG2L	XXXFAh	300002h
CONFIG2H	XXXFBh	300003h
CONFIG3L	XXXFCh	300004h
CONFIG3H	XXXFDh	300005h
CONFIG4L ⁽²⁾	XXXFEh	300006h
CONFIG4H ⁽²⁾	XXXFFh	300007h

Note 1: See Table 2-2 for the complete addresses within code space for specific devices and memory sizes.

2: Unimplemented in PIC18F6XJXX/8XJXX devices.

TABLE 5-2: CONFIGURATION BITS AND DEVICE IDs

File Name		Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0	Default/Unprogrammed Value
300000h	CONFIG1L	DEBUG	XINST	STVREN	—	—	—	—	WDTEN	111- ---1
300001h	CONFIG1H	__(1)	__(1)	__(1)	__(1)	__(2)	CP0	—	—	---- 01--
300002h	CONFIG2L	IESO	FCMEN	—	—	—	FOSC2	FOSC1	FOSC0	11-- -111
300003h	CONFIG2H	__(1)	__(1)	__(1)	__(1)	WDTPS3	WDTPS2	WDTPS1	WDTPS0	---- 1111
300004h	CONFIG3L	WAIT ⁽³⁾	BW ⁽³⁾	EMB1 ⁽³⁾	EMB0 ⁽³⁾	EASHFT ⁽³⁾	—	—	—	1111 1---
300005h	CONFIG3H	__(1)	__(1)	__(1)	__(1)	—	—	ECCPMX ^(3, 5)	CCP2MX	---- --11
3FFFFEh	DEVID1 ⁽⁴⁾	DEV2	DEV1	DEV0	REV4	REV3	REV2	REV1	REV0	See Table 5-4
3FFFFFh	DEVID2 ⁽⁴⁾	DEV10	DEV9	DEV8	DEV7	DEV6	DEV5	DEV4	DEV3	See Table 5-4

Legend: x = unknown, u = unchanged, - = unimplemented, q = value depends on condition.

Shaded cells are unimplemented, read as '0'.

Note 1: The value of these bits in program memory should always be '1'. This ensures that the location is executed as a NOP if it is accidentally executed.

2: This bit should always be maintained '0'.

3: Implemented in 80-pin devices only.

4: DEVID registers are read-only and cannot be programmed by the user.

5: Implemented in PIC18FXXJ10/8XJ15 devices only

PIC18F6XJXX/8XJXX

TABLE 5-3: PIC18F6XJXX/8XJXX BIT DESCRIPTIONS

Bit Name	Configuration Words	Description
DEBUG	CONFIG1L	Background Debugger Enable bit 1 = Background debugger disabled, RB6 and RB7 configured as general purpose I/O pins 0 = Background debugger enabled, RB6 and RB7 are dedicated to In-Circuit Debug
XINST	CONFIG1L	Extended Instruction Set Enable bit 1 = Instruction set extension and Indexed Addressing mode enabled 0 = Instruction set extension and Indexed Addressing mode disabled (Legacy mode)

FCMEN	CONFIG2L	Fail-Safe Clock Monitor Enable bit 1 = Fail-Safe Clock Monitor enabled 0 = Fail-Safe Clock Monitor disabled
FOSC2	CONFIG2L	Primary Oscillator Select bit 1 = Default primary oscillator on start-up is EC or HS, depending on the settings of FOSC1:FOSC0; INTRC selected when OSCCON<1:0> = 11 0 = Default primary oscillator on start-up is INTRC; INTRC is also selected when OSCCON<1:0> = 11 or 00
FOSC1:FOSC0	CONFIG2L	Oscillator Selection bits 11 = EC oscillator, PLL enabled and under software control, CLKO function on OSC2 10 = EC oscillator, CLKO function on OSC2 01 = HS oscillator, PLL enabled and under software control 00 = HS oscillator
WDTPS3:WDTPS0	CONFIG2H	Watchdog Timer Postscale Select bits 1111 = 1:32,768 1110 = 1:16,384 1101 = 1:8,192 1100 = 1:4,096 1011 = 1:2,048 1010 = 1:1,024 1001 = 1:512 1000 = 1:256 0111 = 1:128 0110 = 1:64 0101 = 1:32 0100 = 1:16 0011 = 1:8 0010 = 1:4 0001 = 1:2 0000 = 1:1

PIC18F6XJXX/8XJXX

TABLE 5-3: PIC18F6XJXX/8XJXX BIT DESCRIPTIONS (CONTINUED)

Bit Name	Configuration Words	Description
WAIT	CONFIG3L	External Bus Wait Enable bit 1 = Wait states for operations on external memory bus disabled 0 = Wait states for operations on external memory bus enabled
BW	CONFIG3L	Data Bus Width Select bit 1 = 16-Bit External Bus mode 0 = 8-Bit External Bus mode
EMB1:EMB0	CONFIG3L	External Memory Bus Configuration bits 11 = Extended Microcontroller mode, 20-Bit Address mode 10 = Extended Microcontroller mode, 16-Bit Address mode 01 = Extended Microcontroller mode, 12-Bit Address mode 00 = Microcontroller mode – external bus disabled
EASHFT	CONFIG3L	External Address Bus Shift Enable bit 1 = Address shifting enabled; address on external bus is offset to start at 000000h 0 = Address shifting disabled; address on external bus reflects the PC value
ECCPMX	CONFIG3H	ECCP MUX bit 1 = ECCP1 outputs (P1B/P1C) are multiplexed with RE6 and RE5; ECCP3 outputs (P3B/P3C) are multiplexed with RE4 and RE3 0 = ECCP1 outputs (P1B/P1C) are multiplexed with RH7 and RH6; ECCP3 outputs (P3B/P3C) are multiplexed with RH5 and RH4
CCP2MX	CONFIG3H	CCP2 MUX bit 1 = ECCP2/P2A is multiplexed with RC1 0 = ECCP2/P2A is multiplexed with RE7 in Microcontroller mode (all devices) or with RB3 in Extended Microcontroller mode (80-pin devices only)

5.1 Device ID Word

The Device ID word for PIC18F6XJXX/8XJXX devices is located at 3FFFFEh:3FFFFFh. These read-only bits may be used by the programmer to identify what device type is being programmed and read out normally, even after code or read-protected. The process for reading the Device IDs is shown in Figure 5-1. A complete list of Device ID values for PIC18F6XJXX/8XJXX devices is presented in Table 5-4.

FIGURE 5-1: READ DEVICE ID WORD FLOW

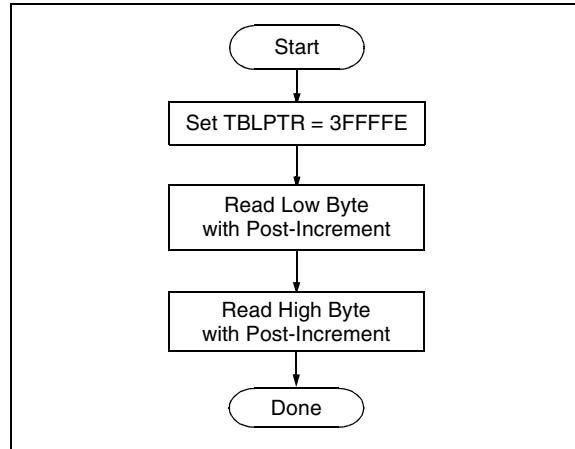

TABLE 5-4: DEVICE ID VALUE

Device	Device ID Value	
	DEVID2	DEVID1
PIC18F63J11	39h	000x xxxx
PIC18F63J90	38h	000x xxxx
PIC18F64J11	39h	001x xxxx
PIC18F64J90	38h	001x xxxx
PIC18F65J10	15h	001x xxxx
PIC18F65J11	39h	011x xxxx
PIC18F65J15	15h	010x xxxx
PIC18F65J90	38h	011x xxxx
PIC18F66J10	15h	011x xxxx
PIC18F66J15	15h	100x xxxx
PIC18F67J10	15h	101x xxxx
PIC18F83J11	39h	100x xxxx
PIC18F83J90	38h	100x xxxx
PIC18F84J11	39h	101x xxxx
PIC18F84J90	38h	101x xxxx
PIC18F85J10	15h	111x xxxx
PIC18F85J11	39h	111x xxxx

PIC18F86J15	17h	010x xxxx
PIC18F87J10	17h	011x xxxx

Legend: The 'x's in DEVID1 are reserved for the device revision code.

PIC18F6XJXX/8XJXX

6.0 AC/DC CHARACTERISTICS AND TIMING REQUIREMENTS FOR PROGRAM/VERIFY TEST MODE

Standard Operating Conditions						
Operating Temperature: 25°C is recommended						
Param No.	Symbol	Characteristic	Min	Max	Units	Conditions
	VDDCORE	External Supply Voltage for Microcontroller Core	2.00	2.70	V	(Note 1)
D111	VDD	Supply Voltage During Programming	VDDCORE	3.60	V	Normal programming (Note 2)
D112	I _{PP}	Programming Current on MCLR	—	5	μA	
D113	I _{DDP}	Supply Current During Programming	—	10	mA	
D031	V _{IL}	Input Low Voltage	V _{SS}	0.2 V _{DD}	V	
D041	V _{IH}	Input High Voltage	0.8 V _{DD}	V _{DD}	V	
D080	V _{OL}	Output Low Voltage	—	0.6	V	I _{OL} = 8.5 mA @ 3.6V
D090	V _{OH}	Output High Voltage	V _{DD} – 0.7	—	V	I _{OH} = -3.0 mA @ 3.6V
D012	C _{IO}	Capacitive Loading on I/O pin (PGD)	—	50	pF	To meet AC specifications
	C _F	Filter Capacitor Value on V _{CAP}	1	10	μF	Required for controller core operation when voltage regulator is enabled

- Note 1:** VDDCORE must be supplied to the VDDCORE/V_{CAP} pin if the on-chip voltage regulator is disabled. See **Section 2.1.1 “On-Chip Voltage Regulator”** for more information.
- 2:** VDD must also be supplied to the AVDD pins during programming and to the ENVREG pin if the on-chip voltage regulator is used. AVDD and AVSS should always be within ±0.3V of VDD and VSS, respectively.

6.0 AC/DC CHARACTERISTICS AND TIMING REQUIREMENTS FOR PROGRAM/VERIFY TEST MODE (CONTINUED)

Standard Operating Conditions						
Operating Temperature: 25°C is recommended						
Param No.	Symbol	Characteristic	Min	Max	Units	Conditions
P1	T _R	MCLR Rise Time to Enter Program/Verify mode	—	1.0	μs	
P2	T _{PGC}	Serial Clock (PGC) Period	100	—	ns	
P2A	T _{PGCL}	Serial Clock (PGC) Low Time	40	—	ns	
P2B	T _{PGCH}	Serial Clock (PGC) High Time	40	—	ns	
P3	T _{SET1}	Input Data Setup Time to Serial Clock ↓	15	—	ns	
P4	T _{HLD1}	Input Data Hold Time from PGC ↓	15	—	ns	
P5	T _{DLY1}	Delay between 4-bit Command and Command Operand	40	—	ns	
P5A	T _{DLY1A}	Delay between 4-bit Command Operand and Next 4-bit Command	40	—	ns	
P6	T _{DLY2}	Delay between Last PGC ↓ of Command Byte to First PGC ↑ of Read of Data Word	20	—	ns	
P9	T _{DLY5}	PGC High Time (minimum programming time)	2.8	—	ms	
P10	T _{DLY6}	PGC Low Time after Programming	400	—	ns	
P11	T _{DLY7}	Delay to allow Bulk Erase to Occur	400	—	ms	
P12	T _{HLD2}	Input Data Hold Time from MCLR ↑	300	—	μs	
P13	T _{SET2}	VDD ↑ Setup Time to MCLR ↑	100	—	ns	
P14	T _{VALID}	Data Out Valid from PGC ↑	10	—	ns	
P16	T _{DLY8}	Delay between Last PGC ↓ and MCLR ↓	0	—	s	
P17	T _{HLD3}	MCLR ↓ to Vdd ↓	—	100	ns	
P19	T _{KEY1}	Delay from First MCLR ↓ to First PGC ↑ for Key Sequence on PGD	40	—	ns	
P20	T _{KEY2}	Delay from Last PGC ↓ for Key Sequence on PGD to Second MCLR ↑	40	—	ns	

Note 1: VDDCORE must be supplied to the VDDCORE/V_{CAP} pin if the on-chip voltage regulator is disabled. See **Section 2.1.1 “On-Chip Voltage Regulator”** for more information.

- 2:** VDD must also be supplied to the AVDD pins during programming and to the ENVREG pin if the on-chip voltage regulator is used. AVDD and AVss should always be within ±0.3V of VDD and Vss, respectively.

PIC18F6XJXX/8XJXX

NOTES:

Note the following details of the code protection feature on Microchip devices:

- Microchip products meet the specification contained in their particular Microchip Data Sheet.
- Microchip believes that its family of products is one of the most secure families of its kind on the market today, when used in the intended manner and under normal conditions.
- There are dishonest and possibly illegal methods used to breach the code protection feature. All of these methods, to our knowledge, require using the Microchip products in a manner outside the operating specifications contained in Microchip's Data Sheets. Most likely, the person doing so is engaged in theft of intellectual property.
- Microchip is willing to work with the customer who is concerned about the integrity of their code.
- Neither Microchip nor any other semiconductor manufacturer can guarantee the security of their code. Code protection does not mean that we are guaranteeing the product as "unbreakable."

Code protection is constantly evolving. We at Microchip are committed to continuously improving the code protection features of our products. Attempts to break Microchip's code protection feature may be a violation of the Digital Millennium Copyright Act. If such acts allow unauthorized access to your software or other copyrighted work, you may have a right to sue for relief under that Act.

Information contained in this publication regarding device applications and the like is provided only for your convenience and may be superseded by updates. It is your responsibility to ensure that your application meets with your specifications. **MICROCHIP MAKES NO REPRESENTATIONS OR WARRANTIES OF ANY KIND WHETHER EXPRESS OR IMPLIED, WRITTEN OR ORAL, STATUTORY OR OTHERWISE, RELATED TO THE INFORMATION, INCLUDING BUT NOT LIMITED TO ITS CONDITION, QUALITY, PERFORMANCE, MERCHANTABILITY OR FITNESS FOR PURPOSE.** Microchip disclaims all liability arising from this information and its use. Use of Microchip's products as critical components in life support systems is not authorized except with express written approval by Microchip. No licenses are conveyed, implicitly or otherwise, under any Microchip intellectual property rights.

Trademarks

**QUALITY MANAGEMENT SYSTEM
CERTIFIED BY DNV
=ISO/TS 16949:2002=**

Microchip received ISO/TS-16949:2002 quality system certification for its worldwide headquarters, design and wafer fabrication facilities in Chandler and Tempe, Arizona and Mountain View, California in October 2003. The Company's quality system processes and procedures are for its PICmicro® 8-bit MCUs, KEELOQ® code hopping devices, Serial EEPROMS, microperipherals, nonvolatile memory and analog products. In addition, Microchip's quality system for the design and manufacture of development systems is ISO 9001:2000 certified.
