

Hall IC Series / Hall IC(Latch type)

# Bipolar Detection Hall ICs

**BU52001GUL, BU52011HFV, BU52021HFV,  
BU52015GUL, BU52025G, BU52051NVX, BD7411G**
**●Description**

The bipolar Hall ICs are magnetic switches that can operate both S-and N-pole , upon which the output goes from Hi to Low. In addition to regular single-output Hall ICs, We offers a line up of dual-output units with a reverse output terminal (active High).

**●Features**

- 1) Bipolar detection
- 2) Micropower operation (small current using intermittent operation method)(BD7411G is excluded.)
- 3) Ultra-compact CSP4 package (BU52001GUL,BU52015GUL)
- 4) Ultra-Small outline package HVSO5 (BU52011HFV,BU52021HFV)
- 5) Ultra-Small outline package SSON004X1216 (BU52051NVX)
- 6) Small outline package (BU52025G,BD7411G)
- 7) Line up of supply voltage
  - For 1.8V Power supply voltage (BU52011HFV,BU52015GUL,BU52051NVX)
  - For 3.0V Power supply voltage (BU52001GUL)
  - For 3.3V Power supply voltage (BU52021HFV,BU52025G)
  - For 5.0V Power supply voltage (BD7411G)
- 8) Dual output type (BU52015GUL)
- 9) High ESD resistance 8kV(HBM)

**●Applications**

Mobile phones, notebook computers, digital video camera, digital still camera, white goods etc.

**●Product Lineup**

Product name	Supply voltage (V)	Operate point (mT)	Hysteresis (mT)	Period (ms)	Supply current (AVG) (A)	Output type	Package
BU52001GUL	2.40~3.30	+/-3.7 ※	0.8	50	8.0 $\mu$	CMOS	VCSP50L1
BU52015GUL	1.65~3.30	+/-3.0 ※	0.9	50	5.0 $\mu$	CMOS	VCSP50L1
BU52051NVX	1.65~3.30	+/-3.0 ※	0.9	50	5.0 $\mu$	CMOS	SSON004X1216
BU52011HFV	1.65~3.30	+/-3.0 ※	0.9	50	5.0 $\mu$	CMOS	HVSO5
BU52021HFV	2.40~3.60	+/-3.7 ※	0.8	50	8.0 $\mu$	CMOS	HVSO5
BU52025G	2.40~3.60	+/-3.7 ※	0.8	50	8.0 $\mu$	CMOS	SSOP5
BD7411G	4.50~5.50	+/-3.4 ※	0.4	-	2.0m	CMOS	SSOP5

※Plus is expressed on the S-pole; minus on the N-pole

●Absolute Maximum Ratings

BU52001GUL (Ta=25°C)

PARAMETERS	SYMBOL	LIMIT	UNIT
Power Supply Voltage	V <sub>DD</sub>	-0.1~+4.5 <sup>※1</sup>	V
Output Current	I <sub>OUT</sub>	±1	mA

●Description of Operations

(Micropower Operation)

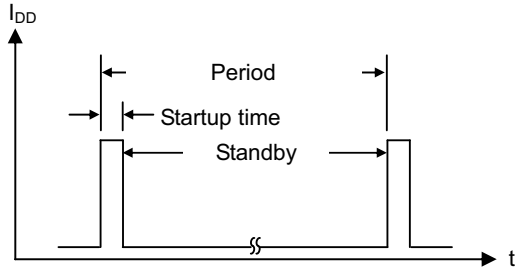

Fig.34

The bipolar detection Hall IC adopts an intermittent operation method to save energy. At startup, the Hall elements, amp, comparator and other detection circuits power ON and magnetic detection begins. During standby, the detection circuits power OFF, thereby reducing current consumption. The detection results are held while standby is active, and then output.

Reference period: 50ms (MAX100ms)

Reference startup time: 48  $\mu$  s

※BD7411G don't adopts an intermittent operation method.

(Offset Cancellation)

Fig.35

The Hall elements form an equivalent Wheatstone (resistor) bridge circuit. Offset voltage may be generated by a differential in this bridge resistance, or can arise from changes in resistance due to package or bonding stress. A dynamic offset cancellation circuit is employed to cancel this offset voltage.

When Hall elements are connected as shown in Fig. 35 and a magnetic field is applied perpendicular to the Hall elements, voltage is generated at the mid-point terminal of the bridge. This is known as Hall voltage.

Dynamic cancellation switches the wiring (shown in the figure) to redirect the current flow to a 90° angle from its original path, and thereby cancels the Hall voltage.

The magnetic signal (only) is maintained in the sample/hold circuit during the offset cancellation process and then released.

(Magnetic Field Detection Mechanism)

Fig.36

The Hall IC cannot detect magnetic fields that run horizontal to the package top layer. Be certain to configure the Hall IC so that the magnetic field is perpendicular to the top layer.

Fig.37

The bipolar detection Hall IC detects magnetic fields running perpendicular to the top surface of the package. There is an inverse relationship between magnetic flux density and the distance separating the magnet and the Hall IC: when distance increases magnetic density falls. When it drops below the operate point (Bop), output goes HIGH. When the magnet gets closer to the IC and magnetic density rises, to the operate point, the output switches LOW. In LOW output mode, the distance from the magnet to the IC increases again until the magnetic density falls to a point just below Bop, and output returns HIGH. (This point, where magnetic flux density restores HIGH output, is known as the release point, Brp.) This detection and adjustment mechanism is designed to prevent noise, oscillation and other erratic system operation.

● Intermittent Operation at Power ON

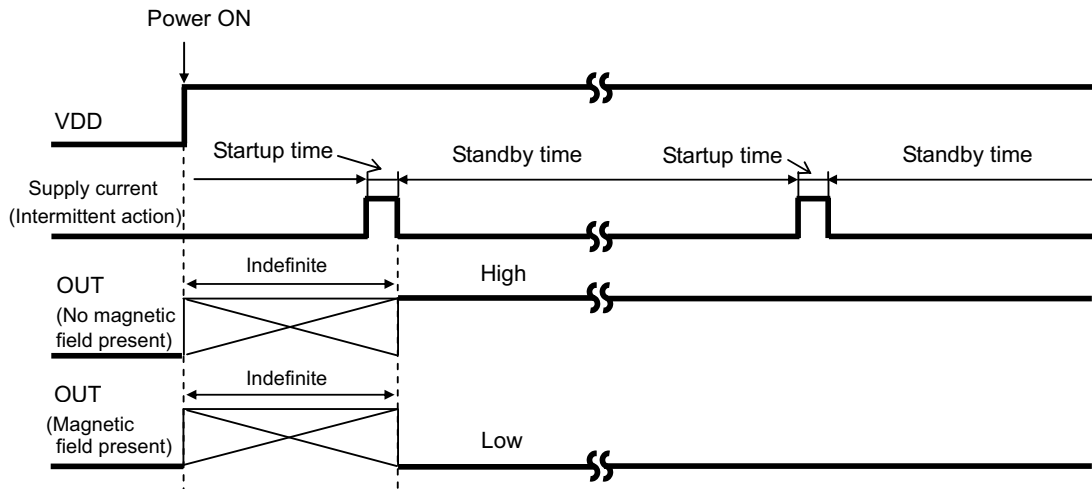

Fig.38

The bipolar detection Hall IC adopts an intermittent operation method in detecting the magnetic field during startup, as shown in Fig. 38. It outputs to the appropriate terminal based on the detection result and maintains the output condition during the standby period. The time from power ON until the end of the initial startup period is an indefinite interval, but it cannot exceed the maximum period, 100ms. To accommodate the system design, the Hall IC output read should be programmed within 100ms of power ON, but after the time allowed for the period ambient temperature and supply voltage.  
 ※BD7411G don't adopts an intermittent operation method.

● Magnet Selection

Of the two representative varieties of permanent magnet, neodymium generally offers greater magnetic power per volume than ferrite, thereby enabling the highest degree of miniaturization. Thus, neodymium is best suited for small equipment applications. Fig. 39 shows the relation between the size (volume) of a neodymium magnet and magnetic flux density. The graph plots the correlation between the distance (L) from three versions of a 4mm X 4mm cross-section neodymium magnet (1mm, 2mm, and 3mm thick) and magnetic flux density. Fig. 40 shows Hall IC detection distance – a good guide for determining the proper size and detection distance of the magnet. Based on the BU52011HFV, BU52015GUL operating point max 5.0 mT, the minimum detection distance for the 1mm, 2mm and 3mm magnets would be 7.6mm, 9.22mm, and 10.4mm, respectively. To increase the magnet's detection distance, either increase its thickness or sectional area.

Fig.40 Magnet Dimensions and Flux Density Measuring Point

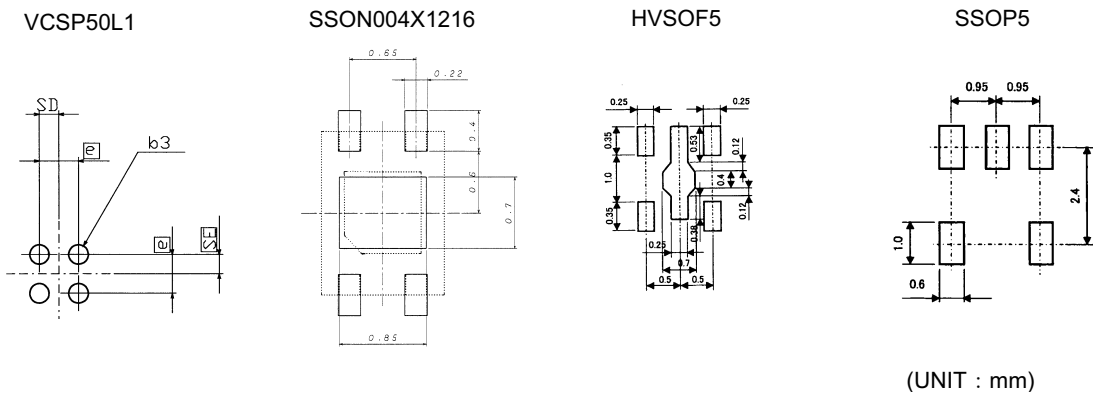

Magnet material: NEOMAX-44H (material)  
 Maker: NEOMAX CO.,LTD.

● Position of the Hall Effect IC(Reference)

● Footprint dimensions (Optimize footprint dimensions to the board design and soldering condition)

Symbol	Reference Value
e	0.50
b3	0.25
SD	0.25
SE	0.25

● Terminal Equivalent Circuit Diagram

Fig.41

Because they are configured for CMOS (inverter) output, the output pins require no external resistance and allow direct connection to the PC. This, in turn, enables reduction of the current that would otherwise flow to the external resistor during magnetic field detection, and supports overall low current (micropower) operation.

## ● Operation Notes

### 1) Absolute maximum ratings

Exceeding the absolute maximum ratings for supply voltage, operating conditions, etc. may result in damage to or destruction of the IC. Because the source (short mode or open mode) cannot be identified if the device is damaged in this way, it is important to take physical safety measures such as fusing when implementing any special mode that operates in excess of absolute rating limits.

### 2) GND voltage

Make sure that the GND terminal potential is maintained at the minimum in any operating state, and is always kept lower than the potential of all other pins.

### 3) Thermal design

Use a thermal design that allows for sufficient margin in light of the power dissipation ( $P_d$ ) in actual operating conditions.

### 4) Pin shorts and mounting errors

Use caution when positioning the IC for mounting on printed circuit boards. Mounting errors, such as improper positioning or orientation, may damage or destroy the device. The IC may also be damaged or destroyed if output pins are shorted together, or if shorts occur between the output pin and supply pin or GND.

### 5) Positioning components in proximity to the Hall IC and magnet

Positioning magnetic components in close proximity to the Hall IC or magnet may alter the magnetic field, and therefore the magnetic detection operation. Thus, placing magnetic components near the Hall IC and magnet should be avoided in the design if possible. However, where there is no alternative to employing such a design, be sure to thoroughly test and evaluate performance with the magnetic component(s) in place to verify normal operation before implementing the design.

### 6) Slide-by position sensing

Fig.42 depicts the slide-by configuration employed for position sensing. Note that when the gap ( $d$ ) between the magnet and the Hall IC is narrowed, the reverse magnetic field generated by the magnet can cause the IC to malfunction. As seen in Fig.43, the magnetic field runs in opposite directions at Point A and Point B. Since the bipolar detection Hall IC can detect the S-pole at Point A and the N-pole at Point B, it can wind up switching output ON as the magnet slides by in the process of position detection. Fig. 44 plots magnetic flux density during the magnet slide-by. Although a reverse magnetic field was generated in the process, the magnetic flux density decreased compared with the center of the magnet. This demonstrates that slightly widening the gap ( $d$ ) between the magnet and Hall IC reduces the reverse magnetic field and prevents malfunctions.

### 7) Operation in strong electromagnetic fields

Exercise extreme caution about using the device in the presence of a strong electromagnetic field, as such use may cause the IC to malfunction.

### 8) Common impedance

Make sure that the power supply and GND wiring limits common impedance to the extent possible by, for example, employing short, thick supply and ground lines. Also, take measures to minimize ripple such as using an inductor or capacitor.

### 9) GND wiring pattern

When both a small-signal GND and high-current GND are provided, single-point grounding at the reference point of the set PCB is recommended, in order to separate the small-signal and high-current patterns, and to ensure that voltage changes due to the wiring resistance and high current do not cause any voltage fluctuation in the small-signal GND. In the same way, care must also be taken to avoid wiring pattern fluctuations in the GND wiring pattern of external components.

10) Exposure to strong light

Exposure to halogen lamps, UV and other strong light sources may cause the IC to malfunction. If the IC is subject to such exposure, provide a shield or take other measures to protect it from the light. In testing, exposure to white LED and fluorescent light sources was shown to have no significant effect on the IC.

11) Power source design

Since the IC performs intermittent operation, it has peak current when it's ON. Please taking that into account and under examine adequate evaluations when designing the power source.

●Product Designations (Selecting a model name when ordering)

VSCP50L1	: GUL	VSCP50L1	: E2
SSON004X1216	: NVX	SSON004X1216	: TR
HVSOF5	: HFV	HVSOF5	: TR
SSOP5	: G	SSOP5	: TR

**VCSP50L1**

**SSON004X1216**

## SSOP5

### <Dimensions>

(Unit:mm)

### < Tape/Reel Info >

Tape	Embossed carrier tape
Quantity	3000pcs
Direction of feed	TR (Correct direction: With reel in the left hand, the 1pin of the product should be at the upper left. Pull tape out with the right hand)

※Orders are available in complete units only.

## HVSOF5

### <Dimensions>

(Unit: mm)

### < Tape/Reel Info >

Tape	Embossed carrier tape
Quantity	3000pcs
Direction of feed	TR (Correct direction: With reel in the left hand, the 1pin of the product should be at the upper left. Pull tape out with the right hand)

※Orders are available in complete units only.

- The contents described herein are correct as of July, 2008
- The contents described herein are subject to change without notice. For updates of the latest information, please contact and confirm with ROHM CO., LTD.
- Any part of this application note must not be duplicated or copied without our permission.
- Application circuit diagrams and circuit constants contained herein are shown as examples of standard use and operation. Please pay careful attention to the peripheral conditions when designing circuits and deciding upon circuit constants in the set.
- Any data, including, but not limited to application circuit diagrams and information, described herein are intended only as illustrations of such devices and not as the specifications for such devices. ROHM CO., LTD. disclaims any warranty that any use of such devices shall be free from infringement of any third party's intellectual property rights or other proprietary rights, and further, assumes no liability of whatsoever nature in the event of any such infringement, or arising from or connected with or related to the use of such devices.
- Upon the sale of any such devices, other than for buyer's right to use such devices itself, resale or otherwise dispose of the same, implied right or license to practice or commercially exploit any intellectual property rights or other proprietary rights owned or controlled by ROHM CO., LTD. is granted to any such buyer.
- The products described herein utilize silicon as the main material.
- The products described herein are not designed to be X ray proof.

The products listed in this catalog are designed to be used with ordinary electronic equipment or devices (such as audio visual equipment, office-automation equipment, communications devices, electrical appliances and electronic toys). Should you intend to use these products with equipment or devices which require an extremely high level of reliability and the malfunction of which would directly endanger human life (such as medical instruments, transportation equipment, aerospace machinery, nuclear-reactor controllers, fuel controllers and other safety devices), please be sure to consult with our sales representative in advance.
