

Smart Four Channel Highside Power Switch

for Industrial Applications

Features

- Overload protection
- Current limitation
- Short-circuit protection
- Thermal shutdown
- Overvoltage protection (including load dump)
- Fast demagnetization of inductive loads
- Reverse battery protection¹)
- Undervoltage and overvoltage shutdown with auto-restart and hysteresis
- Open drain diagnostic output
- Open load detection in ON-state
- CMOS compatible input
- \bullet Loss of ground and loss of V_{bb} protection
- Electrostatic discharge (ESD) protection

Application

- μC compatible power switch with diagnostic feedback for 12 V and 24 V DC grounded loads in industrial applications
- All types of resistive, inductive and capacitive loads
- Replaces electromechanical relays and discrete circuits

General Description

N channel vertical power FET with charge pump, ground referenced CMOS compatible input and diagnostic feedback, monolithically integrated in Smart SIPMOS[®] technology. Providing embedded protective functions.

Pin	Symbol	Function
1,10, 11,12, 15,16, 19,20	V _{bb}	Positive power supply voltage . Design the wiring for the simultaneous max. short circuit currents from channel 1 to 4 and also for low thermal resistance
3	IN1	Input 1 4, activates channel 1 4 in case of
5	IN2	logic high signal
7	IN3	
9	IN4	
18	OUT1	Output 1 4, protected high-side power output
17	OUT2	of channel 1 4. Design the wiring for the
14	OUT3	max. short circuit current
13	OUT4	
4	ST1/2	Diagnostic feedback 1/2 of channel 1 and channel 2, open drain, low on failure
8	ST3/4	Diagnostic feedback 3/4 of channel 3 and
		channel 4, open drain, low on failure
2	GND1/2	Ground 1/2 of chip 1 (channel 1 and channel 2)
6	GND3/4	Ground 3/4 of chip 2 (channel 3 and channel 4)

⁹⁾ Add I_{ST} , if $I_{ST} > 0$

 $I_{\rm L} = -1.9 \, \text{A}, T_{\rm j} = +150^{\circ} \text{C}$

¹²⁾ Requires a 150 Ω resistor in GND connection. The reverse load current through the intrinsic drain-source diode has to be limited by the connected load. Note that the power dissipation is higher compared to normal operating conditions due to the voltage drop across the intrinsic drain-source diode. The temperature protection is not active during reverse current operation! Input and Status currents have to be limited (see max. ratings page 3 and circuit page 8).

¹⁰⁾ Integrated protection functions are designed to prevent IC destruction under fault conditions described in the data sheet. Fault conditions are considered as "outside" normal operating range. Protection functions are not designed for continuous repetitive operation.

¹¹⁾ If channels are connected in parallel, output clamp is usually accomplished by the channel with the lowest V_{ON(CL)}

H = "High" Level Status signal valid after the time delay shown in the timing diagrams

Parallel switching of channel 1 and 2 (also channel 3 and 4) is easily possible by connecting the inputs and outputs in parallel (see truth table). If switching channel 1 to 4 in parallel, the status outputs ST1/2 and ST3/4 have to be configured as a 'Wired OR' function with a single pull-up resistor.

Terms

Leadframe (V_{bb}) is connected to pin 1,10,11,12,15,16,19,20 External R_{GND} optional; two resistors R_{GND1/2}, R_{GND3/4} = 150 Ω or a single resistor R_{GND} = 75 Ω for reverse battery protection up to the max. operating voltage.

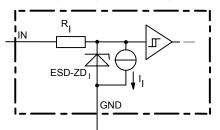

¹⁷⁾ Low resistance to V_{bb} may be detected by no-load-detection

¹⁵⁾ With additional external pull up resistor

¹⁶⁾ An external short of output to V_{bb} in the off state causes an internal current from output to ground. If R_{GND} is used, an offset voltage at the GND and ST pins will occur and the $V_{ST low}$ signal may be errorious.

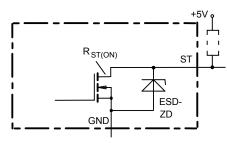

Input circuit (ESD protection), IN1...4

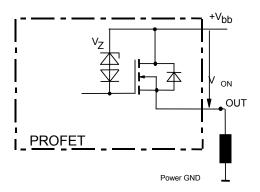

ESD zener diodes are not to be used as voltage clamp at DC conditions. Operation in this mode may result in a drift of the zener voltage (increase of up to 1 V).

Status output, ST1/2 or ST3/4

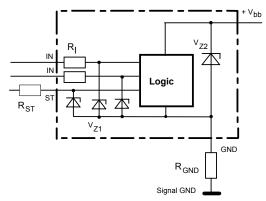

ESD-Zener diode: 6.1 V typ., max 5.0 mA; $R_{ST(ON)} < 380 \ \Omega$ at 1.6 mA, ESD zener diodes are not to be used as voltage clamp at DC conditions. Operation in this mode may result in a drift of the zener voltage (increase of up to 1 V).

Inductive and overvoltage output clamp, OUT1...4

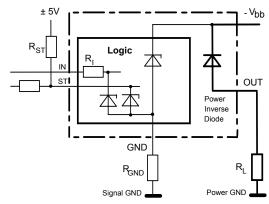

VON clamped to VON(CL) = 47 V typ.

Overvoltage protection of logic part GND1/2 or GND3/4

 V_{Z1} = 6.1 V typ., V_{Z2} = 47 V typ., R_I = 3.5 k Ω typ., R_{GND} = 150 Ω

Reverse battery protection

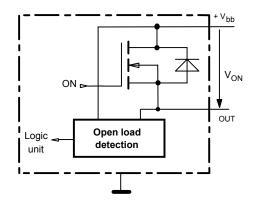

Temperature protection is not active during inverse current operation.

Open-load detection, OUT1...4

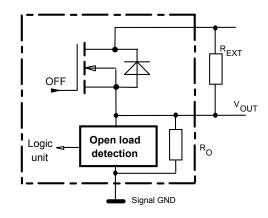

ON-state diagnostic condition:

 $V_{ON} < R_{ON} \cdot I_{L(OL)}$; IN high

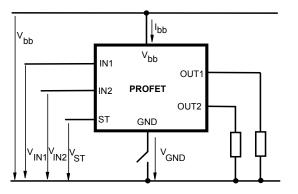

OFF-state diagnostic condition:

GND disconnect

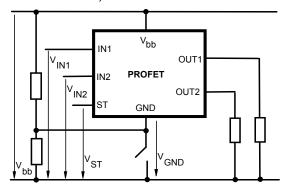

(channel 1/2 or 3/4)

Any kind of load. In case of IN = high is $V_{OUT} \approx V_{IN} - V_{IN(T+)}$. Due to $V_{GND} > 0$, no V_{ST} = low signal available.

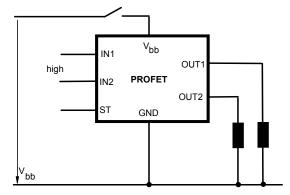

GND disconnect with GND pull up

(channel 1/2 or 3/4)

Any kind of load. If $V_{GND} > V_{IN} - V_{IN}(T+)$ device stays off Due to $V_{GND} > 0$, no $V_{ST} =$ low signal available.

$V_{\mbox{\scriptsize bb}}$ disconnect with energized inductive load

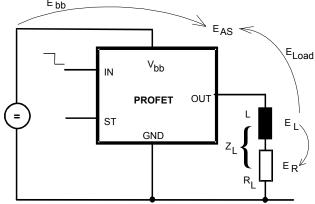

For an inductive load current up to the limit defined by ${\sf E}_{AS}$ (max. ratings see page 3 and diagram on page 10) each switch is protected against loss of ${\sf V}_{bb}.$

Consider at your PCB layout that in the case of Vbb disconnection with energized inductive load the whole load current flows through the GND connection.

Inductive load switch-off energy dissipation E bb

Energy stored in load inductance:

$$E_{\rm L} = \frac{1}{2} \cdot {\rm L} \cdot {\rm I}_{\rm L}^2$$

While demagnetizing load inductance, the energy dissipated in PROFET is

 $E_{AS} = E_{bb} + E_L - E_R = \int V_{ON(CL)} \cdot i_L(t) dt$

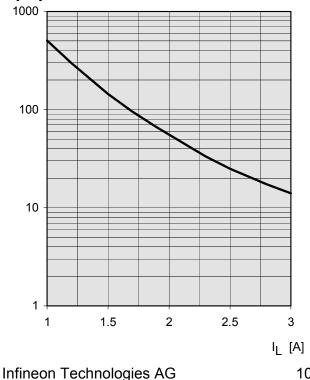

with an approximate solution for $R_{I} > 0 \Omega$:

$$E_{\text{AS}} = \frac{I_{\text{L}} \cdot L}{2 \cdot R_{\text{L}}} (V_{\text{bb}} + |V_{\text{OUT}(\text{CL})}|) ln (1 + \frac{I_{\text{L}} \cdot R_{\text{L}}}{|V_{\text{OUT}(\text{CL})}|})$$

Maximum allowable load inductance for a single switch off (one channel)⁵⁾

 $L = f(\bar{I_L})$; T_{j,start} = 150°C, V_{bb} = 12 V, R_L = 0 Ω

L [mH]

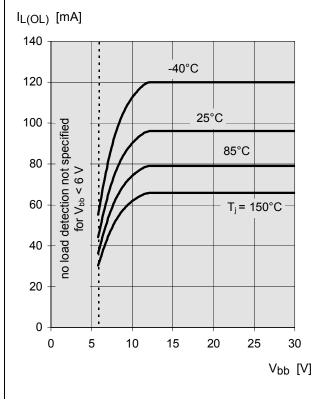

Typ. on-state resistance

 $R_{ON} = f(V_{bb}, T_i); I_{L} = 1.8 \text{ A}, IN = high$

Typ. open load detection current

 $I_{L(OL)} = f(V_{bb}, T_i);$ IN = high

Typ. standby current

 $I_{bb(off)} = f(T_j); V_{bb} = 9...34 \text{ V}, \text{IN1...4} = \text{Iow}$

Typ. initial short circuit shutdown time

 $t_{off(SC)} = f(T_{j,start}); V_{bb} = 12 V$

Timing diagrams

Timing diagrams are shown for chip 1 (channel 1/2). For chip 2 (channel 3/4) the diagrams are valid too. The channels 1 and 2, respectively 3 and 4, are symmetric and consequently the diagrams are valid for each channel as well as for permuted channels

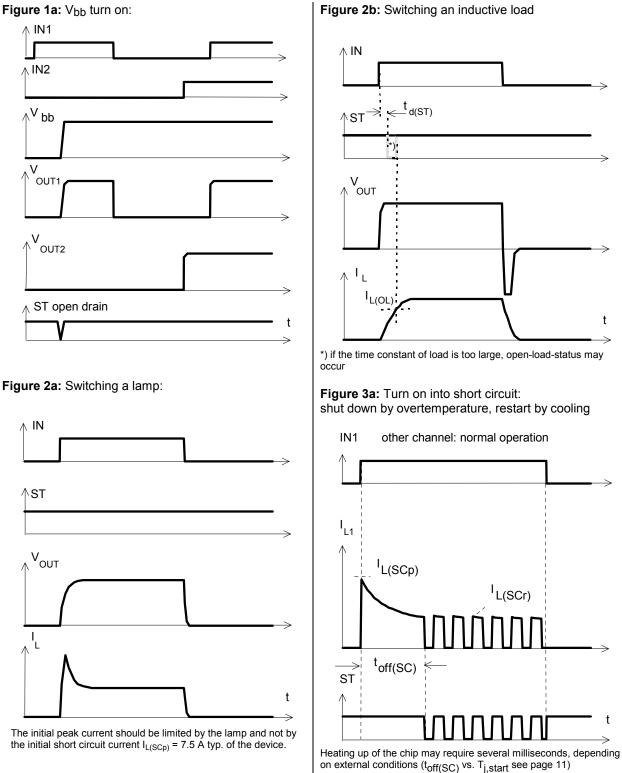

Figure 3b: Turn on into short circuit: shut down by overtemperature, restart by cooling (two parallel switched channels 1 and 2)

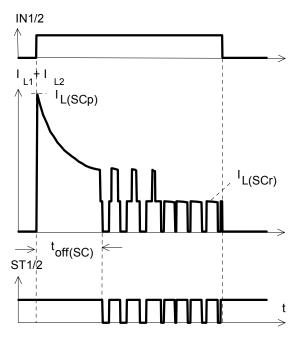

Figure 4a: Overtemperature: Reset if $T_j < T_{jt}$

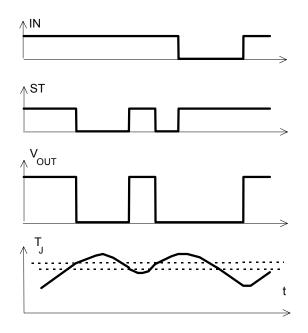

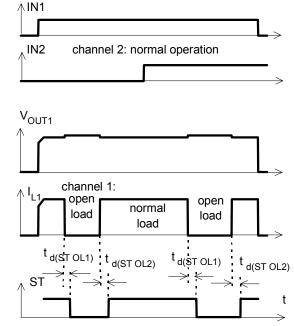

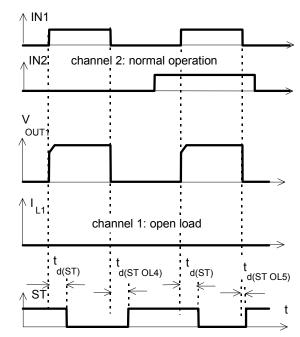

Figure 5a: Open load: detection in ON-state, open load occurs in on-state

 $t_{d(ST OL1)}$ = 30 µs typ., $t_{d(ST OL2)}$ = 20 µs typ

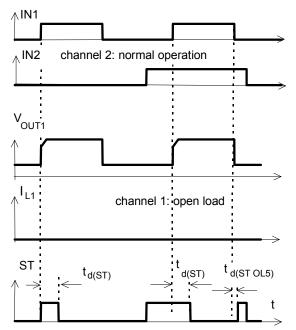

Figure 5b: Open load: detection in ON-state, turn on/off to open load

The status delay time td(STOL4) allows to distinguish between the failure modes "open load in ON-state" and "overtemperature".

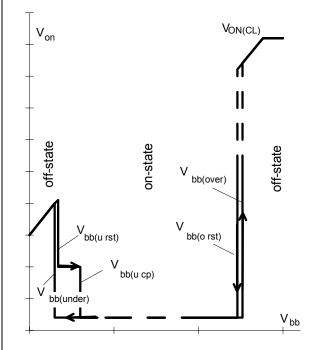

Figure 5c: Open load: detection in ON- and OFF-state (with R_{EXT}), turn on/off to open load

 $t_{d(\text{ST OL5})}$ depends on external circuitry because of high impedance

Figure 6b: Undervoltage restart of charge pump

IN = high, normal load conditions. Charge pump starts at $V_{bb(ucp)}$ = 5.6V typ.

Figure 6a: Undervoltage:

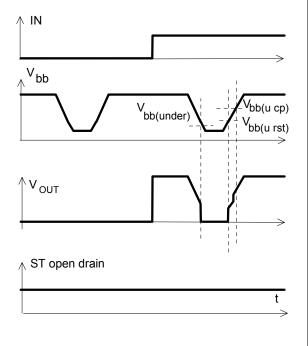

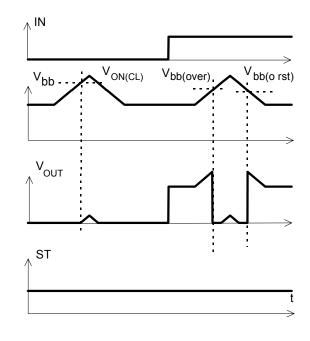

Figure 7a: Overvoltage:
