

## Low Power Ambient Light and Proximity Sensor with Intelligent Interrupt and Sleep Modes

## ISL29028

The ISL29028 is an integrated ambient and infrared light-to-digital converter with a built-in IR LED driver and  $I^2C$  Interface (SMBus Compatible). This device uses two independent ADCs for concurrently measuring ambient light and proximity in parallel. The flexible interrupt scheme is designed for minimal microcontroller utilization.

For ambient light sensor (ALS) data conversions, an ADC converts photodiode current (with a light sensitivity range up to 2000 Lux) in 100ms per sample. The ADC rejects 50Hz/60Hz flicker noise caused by artificial light sources.

For proximity sensor (Prox) data conversions, the built-in driver turns on an external infrared LED and the proximity sensor ADC converts the reflected IR intensity to digital. This ADC rejects ambient IR noise (such as sunlight) and has a 540 $\mu$ s conversion time.

The ISL29028 provides low power operation of ALS and proximity sensing with a typical 138 $\mu$ A normal operation current (110 $\mu$ A for sensors and internal circuitry, ~28 $\mu$ A for external LED) with 220mA current pulses for a net 100 $\mu$ s, repeating every 800ms (or under).

The ISL29028 uses both a hardware pin and software bits to indicate an interrupt event has occurred. An ALS interrupt is defined as a measurement which is outside a set window. A proximity interrupt is defined as a measurement over a threshold limit. The user may also require that both ALS/prox interrupts occur at once, up to 16 times in a row before activating the interrupt pin.

The ISL29028 is designed to operate from 2.25V to 3.63V over the -40°C to +85°C ambient temperature range. It is packaged in a clear, lead-free 8 lead ODFN package.

## **Pin Configuration**

ISL29028

\*THERMAL PAD CAN BE CONNECTED TO GND OR ELECTRICALLY ISOLATED

1

### **Features**

- Works Under All Light Sources Including Sunlight
- Dual ADCs Measure ALS/Prox Concurrently
- Intelligent Interrupt Scheme Simplifies  $\mu$ C Code **Ambient Light Sensing**
- Simple Output Code Directly Proportional to lux
- 50Hz/60Hz Flicker Noise and IR Rejection
- Light Sensor Close to Human Eye Response
- Selectable 125/2000 Lux Range

#### **Proximity Sensing**

- Proximity Sensor with Broad IR Spectrum
   Can Use 850nm and 950nm External IR LEDs
- IR LED Driver with I<sup>2</sup>C Programmable Sink Currents
  - Net 100µs Pulse with 110mA or 220mA Amplitudes
  - Periodic Sleep Time up to 800ms Between Pulses
- Ambient IR Noise Cancellation (Including Sunlight)

### **Intelligent and Flexible Interrupts**

- Independent ALS/Prox Interrupt Thresholds
- Adjustable Interrupt Persistency
  - 1/4/8/16 Consecutive Triggers Required Before Interrupt

### **Ultra Low Power**

- 138µA DC Typical Supply Current for ALS/Prox Sensing
  - 110µA for Sensors and Internal Circuitry
  - 28µA Typical Current for External IR LED (Assuming 220mA for 100µs Every 800ms)
- <1.0µA Supply Current When Powered Down

### Easy to Use

- Set Registers; Wait for Interrupt
- I<sup>2</sup>C (SMBus Compatible) Output
- Temperature Compensated
- Tiny ODFN8 2.0x2.1x0.7 (mm) Package

### **Additional Features**

- 1.7V to 3.63V Supply for I<sup>2</sup>C Interface
- 2.25V to 3.63V Sensor Power Supply
- Pb-Free (RoHS compliant)
- I<sup>2</sup>C Address Selection Pin

### **Applications**\*(see page 14)

- Display and Keypad Dimming Adjustment and Proximity Sensing for:
  - Mobile Devices: Smart Phone, PDA, GPS
  - Computing Devices: Laptop PC, Netbook
  - Consumer Devices: LCD-TV, Digital Picture Frame, Digital Camera
- Industrial and Medical Light and Proximity Sensing

NOTES:

- 1. Please refer to TB347 for details on reel specifications.
- 2. These Intersil Pb-free plastic packaged products employ special Pb-free material sets; molding compounds/die attach materials and NiPdAu plate e4 termination finish, which is RoHS compliant and compatible with both SnPb and Pb-free soldering operations. Intersil Pb-free products are MSL classified at Pb-free peak reflow temperatures that meet or exceed the Pb-free requirements of IPC/JEDEC J STD-020.
- 3. For Moisture Sensitivity Level (MSL), please see device information page for <u>ISL29028</u>. For more information on MSL please see techbrief <u>TB363</u>.

## **Pin Descriptions**

| PIN NUMBER | PIN NAME |  | DESCRIPTION   |  |  |  |  |
|------------|----------|--|---|--|--|--|--|
| 0          | T.PAD    | Thermal Pad (connect to C                              | hermal Pad (connect to GND or float)  |  |  |  |  |
| 1          | ADDR0    | I <sup>2</sup> C address pin - pull high               | C address pin - pull high or low (do not float)   |  |  |  |  |
| 2          | VDD      | Positive supply: 2.25V to 2                            | ositive supply: 2.25V to 3.63V  |  |  |  |  |
| 3          | GND      | Ground   |   |  |  |  |  |
| 4          | REXT     | External resistor (499kΩ;                              | 1%) connects this pin to ground   |  |  |  |  |
| 5          | SCL      | I <sup>2</sup> C clock line                            | The $\mathrm{I}^2\mathrm{C}$ bus lines can be pulled from 1.7V to above $\mathrm{V}_{\mathrm{DD}},$ 3.63V |  |  |  |  |

| http://www.intersil.com/pbfree/Pb-FreeReflo | w.asp                  |

CAUTION: Do not operate at or near the maximum ratings listed for extended periods of time. Exposure to such conditions may adversely impact product reliability and result in failures not covered by warranty.

#### NOTES:

- 4.  $\theta_{JA}$  is measured in free air with the component mounted on a high effective thermal conductivity test board with "direct attach" features. See Tech Brief TB379.
- 5. ESD on all pins is 2kV except for IRDR, which is 1.5kV.

IMPORTANT NOTE: All parameters having Min/Max specifications are guaranteed. Typical values are for information purposes only. Unless otherwise noted, all tests are at the specified temperature and are pulsed tests, therefore:  $T_J = T_C = T_A$

#### **Electrical Specifications** $V_{DD} = 3.0V$ , $T_A = +25^{\circ}C$ , $R_{EXT} = 499k\Omega 1\%$ tolerance. (Continued)

NOTES:

6. A 550nm green LED is used in production test. The 550nm LED irradiance is calibrated to produce the same DATA count against a fluorescent light source of the same lux level.

- 7. 850nm infrared LED is used in production test for proximity/IR sensitivity testing.
- 8. Ability to guarantee  $I_{IRDR}$  leakage of  ${\sim}1nA$  is limited by test hardware.

### **Register Map**

There are ten 8-bit registers accessible via  $I^2C$ . Registers 0x1 and 0x2 define the operation mode of the device. Registers 0x3 through 0x7 store the various ALS/IR/Prox thresholds which trigger interrupt events. Registers 0x8 through 0xA store the results of ALS/IR/Prox ADC conversions.

|      |           |           |                           |              |           | BIT      |        |           |            |         |

FIGURE 2. I<sup>2</sup>C DRIVER TIMING DIAGRAM FOR MASTER AND SLAVE CONNECTED TO COMMON BUS

## **Principles of Operation**

### I<sup>2</sup>C Interface

The ISL29028's I<sup>2</sup>C interface slave address is internally hardwired as 0b100010<x>, where "0b" signifies binary notation and x represents the logic level on pin ADDR0. Figure 2 shows a sample one-byte read. The I<sup>2</sup>C bus master always drives the SCL (clock) line, while either the master or the slave can drive the SDA (data) line. Every I<sup>2</sup>C transaction begins with the master asserting a start condition (SDA falling while SCL remains high). The first transmitted byte is initiated by the master and includes 7 address bits and a R/W bit. The slave is responsible for pulling SDA low during the ACK bit after every transmitted byte.

Each  $I^2C$  transaction ends with the master asserting a stop condition (SDA rising while SCL remains high).

For more information about the I<sup>2</sup>C standard, please consult the Philips<sup>TM</sup> I<sup>2</sup>C specification documents.

### **Photodiodes and ADCs**

The ISL29028 contains two photodiode arrays which convert photons (light) into current. The ALS photodiodes are constructed to mimic the human eye's wavelength response curve to visible light (see Figure 6). The ALS photodiodes' current output is digitized by a 12-bit ADC in 100ms. These 12 bits can be accessed by reading from I<sup>2</sup>C registers 0x9 and 0xA when the ADC conversion is completed.

The ALS converter is a charge-balancing integrating 12-bit ADC. Charge-balancing is best for converting small current signals in the presence of periodic AC noise. Integrating over 100ms highly rejects both 50Hz and 60Hz light flicker by picking the lowest integer number of cycles for both 50Hz/60Hz frequencies.

FIGURE 3. TIMING DIAGRAM FOR PROX/ALS EVENTS - NOT TO SCALE

The proximity sensor is an 8-bit ADC which operates in a similar fashion. When proximity sensing is enabled, the IRDR pin will drive a user-supplied infrared LED, the emitted IR reflects off an object (i.e., a human head) back into the ISL29028, and a sensor converts the reflected IR wave to a current signal in 0.54ms. The ADC subtracts the IR reading before and after the LED is driven (to remove ambient IR such as sunlight), and converts this value to a digital count stored in Register 0x8.

The ISL29028 is designed to run two conversions concurrently: a proximity conversion and an ALS (or IR) conversion. Please note that because of the conversion times, the user must let the ADCs perform one full conversion first before reading from I<sup>2</sup>C Registers PROX\_DATA (wait 0.54ms) or ALSIR\_DT1/2 (wait 100ms). The timing between ALS and Prox conversions is arbitrary (as shown in Figure 3). The ALS runs continuously with new data available every 100ms. The proximity sensor runs continuously with a time between conversions decided by PROX\_SLP (Register 1 Bits [6:4]).

### **Ambient Light and IR Sensing**

The ISL29028 is set for ambient light sensing when Register bit ALSIR\_MODE = 0 and ALR\_EN = 1. The light-wavelength response of the ALS appears as shown in Figure 6. ALS measuring mode (as opposed to IR measuring mode) is set by default.

When the part is programmed for infrared (IR) sensing (ALSIR\_MODE = 1; ALS\_EN = 1), infrared light is converted into a current and digitized by the same ALS ADC. The result of an IR conversion is *strongly related* to the amount of IR energy incident on our sensor, but is unitless and is referred to in digital counts.

### **Proximity Sensing**

When proximity sensing is enabled (PROX\_EN = 1), the external IR LED is driven for 0.1ms by the built-in IR LED driver through the IRDR pin. The amplitude of the IR LED

current depends on Register 1 bit 3: PROX\_DR. If this bit is low, the load will see a fixed 110mA current pulse. If this bit is high, the load on IRDR will see a fixed 220mA current pulse as seen in Figure 4.

**FIGURE 4. CURRENT DRIVE MODE OPTIONS** 

When the IR from the LED reaches an object and gets reflected back into the ISL29028, the reflected IR light is converted into current as per the IR spectral response shown in Figure 7. One entire proximity measurement takes 0.54ms for one conversion (which includes 0.1ms spent driving the LED), and the period *between* proximity measurements is decided by PROX\_SLP (sleep time) in Register 1 Bits 6:4.

Average LED driving current consumption is given by Equation 1.

$$I_{\text{IRDR;AVE}} = \frac{I_{\text{IRDR;PEAK}} \times 100 \,\mu\text{s}}{T_{\text{SLEEP}}}$$
(EQ. 1)

A typical IRDR scheme is 220mA amplitude pulses every 800ms, which yields 28 $\mu A$  DC.

### **Total Current Consumption**

Total current consumption is the sum of  $I_{DD}$  and  $I_{IRDR}.$  The IRDR pin sinks current (as shown in Figure 4) and the average IRDR current can be calculated using Equation 1 above.  $I_{DD}$  depends on voltage and the mode-of-operation as seen in Figure 11.

### **Interrupt Function**

The ISL29028 has an intelligent interrupt scheme designed to shift some logic processing away from intensive microcontroller  $I^2C$  polling routines (which consume power) and towards a more independent light sensor which can instruct a system to "wake up" or "go to sleep".

An ALS interrupt event (ALS\_FLAG) is governed by Registers 5 through 7. The user writes a high and low threshold value to these registers and the ISL29028 will issue an ALS interrupt flag if the actual count stored in Registers 0x9 and 0xA are outside the user's programmed window. The user must write 0 to clear the ALS\_FLAG.

A proximity interrupt event (PROX\_FLAG) is governed by the high and low thresholds in registers 3 and 4 (PROX\_LT and PROX\_HT). PROX\_FLAG is set when the measured proximity data is more than the higher threshold X-times-in-a-row (X is set by user; see next paragraph). The proximity interrupt flag is cleared when the prox data is lower than the low proximity threshold X-times-in-a-row, or when the user writes "0" to PROX\_FLAG.

Interrupt persistency is another useful option available for both ALS and proximity measurements. Persistency requires X-in-a-row interrupt flags before the INT pin is driven low. Both ALS and Prox have their own independent interrupt persistency options. See ALS\_PRST and PROX\_PRST bits in Register 2.

The final interrupt option is the ability to AND or OR the two interrupt flags using Register 2 Bit 0 (INT\_CTRL). If the user wants both ALS/Prox interrupts to happen at the same time before changing the state of the interrupt pin, set this bit high. If the user wants the interrupt pin to change state when *either* the ALS or the Proximity interrupt flag goes high, leave this bit to its default of 0.

### V<sub>DD</sub> Power-up and Power Supply Considerations

Upon power-up, please ensure a V<sub>DD</sub> slew rate of 0.5V/ms or greater. After power-up, or if the user's power supply temporarily deviates from our specification (2.25V to 3.63V), Intersil recommends the user write 0x00 to three registers: 0x0E, 0x0F, and 0x01 (in that order), wait ~1ms or more and then rewrite all registers to the desired values. If the user prefers a hardware reset method instead of writing to test registers: set V<sub>DD</sub> = 0V for 1 second or more, power back up at the required slew rate, and write registers to the desired values.

### **Power-Down**

To put the ISL29028 into a power-down state, the user can set both PROX\_EN and ALS\_EN bits to 0 in Register 1. Or more simply, set all of Register 1 to 0x00.

### **Calculating Lux**

The ISL29028's ADC output codes are directly proportional to lux when in ALS mode (see ALSIR\_MODE bit).

10

 $\mathsf{E}_{\texttt{calc}} = \alpha_{\texttt{RANGE}} \times \mathsf{OUT}_{\texttt{ADC}}$ 

In Equation 2,  $E_{calc}$  is the calculated lux reading and *OUT* represents the ADC code. The constant  $\alpha$  to plug in is determined by the range bit ALS\_RANGE (register 0x1 bit 1) and is independent of the light source type.

| ALS_RANGE | a <sub>RANGE</sub><br>(Lux/Count) |
|-----------|-----------------------------------|
| 0         | 0.0326                            |
| 1         | 0.522                             |

Table 15 shows two different scale factors: one for the low range (ALS\_RANGE = 0) and the other for the high range (ALS\_RANGE = 1).

### **Noise Rejection**

Charge balancing ADC's have excellent noise-rejection characteristics for periodic noise sources whose frequency is an integer multiple of the conversion rate. For instance, a 60Hz AC unwanted signal's sum from 0ms to k\*16.66ms (k =  $1,2...k_i$ ) is zero. Similarly, setting the device's integration time to be an integer multiple of the periodic noise signal greatly improves the light sensor output signal in the presence of noise. Since wall sockets may output at 60Hz or 50Hz, our integration time is 100ms: the lowest common integer number of cycles for both frequencies.

### **Proximity Detection of Various Objects**

Proximity sensing relies on the amount of IR reflected back from objects. A perfectly black object would absorb all light and reflect no photons. The ISL29028 is sensitive enough to detect black ESD foam which reflects only 1% of IR. For biological objects, blonde hair reflects more than brown hair and customers may notice that skin tissue is much more reflective than hair. IR penetrates into the skin and is reflected or scattered back from within. As a result, the proximity count peaks at contact and monotonically decreases as skin moves away. The reflective characteristics of skin are very different from that of paper.

## **Typical Circuit**

A typical application for the ISL29028 is shown in Figure 5. The ISL29028's I<sup>2</sup>C address is internally hardwired as 0b100010<x>, with x representing the logic state of input I<sup>2</sup>C address pin ADDR0. The device can be tied onto a system's I<sup>2</sup>C bus together with other I<sup>2</sup>C compliant devices.

### **Soldering Considerations**

Convection heating is recommended for reflow soldering; direct-infrared heating is not recommended. The plastic ODFN package does not require a custom reflow soldering profile, and is qualified to +260°C. A standard reflow soldering profile with a +260°C maximum is recommended.

## **Suggested PCB Footprint**

It is important that users check the "Surface Mount Assembly Guidelines for Optical Dual FlatPack No Lead (ODFN) Package" before starting ODFN product board mounting.

### Layout Considerations

The ISL29028 is relatively insensitive to layout. Like other  $I^2C$  devices, it is intended to provide excellent performance even in significantly noisy environments. There are only a few considerations that will ensure best performance.

Route the supply and  $I^2C$  traces as far as possible from all sources of noise. A  $0.1\mu\text{F}$  and  $1\mu\text{F}$  power supply decoupling capacitors need to be placed close to the device.

**Typical Performance Curves**  $v_{DD} = 3.0V$ ,  $R_{EXT} = 499k\Omega$

## **Revision History**

The revision history provided is for informational purposes only and is believed to be accurate, but not warranted. Please go to web to make sure you have the latest Rev.

| DATE   | REVISION | CHANGE           |
|--------|----------|------------------|
| 3/2/10 | FN6780.0 | Initial release. |

## **Products**

Intersil Corporation is a leader in the design and manufacture of high-performance analog semiconductors. The Company's products address some of the industry's fastest growing markets, such as, flat panel displays, cell phones, handheld products, and notebooks. Intersil's product families address power management and analog signal processing functions. Go to <u>www.intersil.com/products</u> for a complete list of Intersil product families.

\*For a complete listing of Applications, Related Documentation and Related Parts, please see the respective device information page on intersil.com: <u>ISL29028</u>

To report errors or suggestions for this datasheet, please go to www.intersil.com/askourstaff

FITs are available from our website at http://rel.intersil.com/reports/search.php

For additional products, see <u>www.intersil.com/product\_tree</u>

Intersil products are manufactured, assembled and tested utilizing ISO9000 quality systems as noted in the quality certifications found at <u>www.intersil.com/design/quality</u>

Intersil products are sold by description only. Intersil Corporation reserves the right to make changes in circuit design, software and/or specifications at any time without notice. Accordingly, the reader is cautioned to verify that data sheets are current before placing orders. Information furnished by Intersil is believed to be accurate and reliable. However, no responsibility is assumed by Intersil or its subsidiaries for its use; nor for any infringements of patents or other rights of third parties which may result from its use. No license is granted by implication or otherwise under any patent or patent rights of Intersil or its subsidiaries.

### L8.2.1x2.0

8 LEAD OPTICAL DUAL FLAT NO-LEAD PLASTIC PACKAGE (ODFN) Rev 1, 12/09

BOTTOM VIEW

TYPICAL RECOMMENDED LAND PATTERN

NOTES:

- 1. Dimensions are in millimeters. Dimensions in ( ) for Reference Only.
- 2. Dimensioning and tolerancing conform to ASME Y14.5m-1994.
- 3. Unless otherwise specified, tolerance : Decimal ± 0.05
- 4. Dimension b applies to the metallized terminal and is measured between 0.25mm and 0.35mm from the terminal tip.
- 5. Tiebar shown (if present) is a non-functional feature.
- 6. The configuration of the pin #1 identifier is optional, but must be located within the zone indicated. The pin #1 identifier may be either a mold or mark feature.
