

Ergonomic adjustable wrenches

BAHCO

The grip

The adjustable wrench is an unbeatable hand tool for people who are tired of having to carry loads of heavy spanners and socket wrenches around.

We know that you the professional expect your tools to maintain a high quality as regards precision, ease of use, strength and design so that you can do a good job in all situations.

Sandvik Bahco's ergo adjustable wrenches make work easier for assembly and repair workers all over the world and their place in the professional's toolbox is well motivated.

Made to withstand rough use

Ergo adjustable wrenches have been designed to cope with the most demanding work. Scientific studies on how professionals use adjustable wrenches have formed the basis of the design. The handle of an ergo adjustable wrench has been designed to use the strength of the hand and to give the best possible grip in different work situations.

Available with hard or soft handle

The ergo adjustable wrench is available in two types. The 80 series has a traditional, extra wide, rounded steel handle. The 90 series has a forged handle with a comfortable sleeve of thermoplastic elastomer. The sleeve is suited to the way in which the hand works and strain can therefore be reduced. The sleeve also gives a "warm" grip under cold working conditions and a "cool" grip at high temperatures.

The plastic material withstands temperatures ranging from -40° to +100° C. The roughened surface of the sleeve offers a firm grip even when the handle is oily and dirty.

The forging design protects the hand

Sandvik Bahco's ergonomic adjustable wrenches are produced in one of the world's most modern forging plants using more than a hundred years experience in manufacturing adjustable wrenches. The handles are smoothly rounded and have no sharp edges which can injure the hand. The adjustable wrench's unique design is trade mark protected.

Functions

A Sandvik Bahco ergo adjustable wrench has more functions and advantages than any other adjustable wrench on the market. The idea behind all these finesses is of course to make work easier, more effortless, safer and more enjoyable. Sandvik Bahco has the market's widest range of adjustable wrenches to cope with most sizes of nut, bolt and screw. We also have the combination adjustable wrench and a number of classic special adjustable wrenches like No. 31 the "shark jaw" and No.10 the "bike adjustable".

Stronger than the demands set by ISO and US standards – whichever drive direction is used.

15° angle for maximum access in confined spaces.

Narrower and thinner jaws for better access.

Shaft on moveable jaw completely hidden in handle allows better access and gives greater strength.

Parallel jaw faces

Scale for pre-setting jaw opening and for measuring bolt heads, metal thickness, etc.

Extra coarse serrating on the adjustable knurl for easier setting.

Generous opening for adjustable knurl makes setting jaw opening easy even when wearing gloves.

Ergonomically designed sleeve distributes pressure evenly in the hand, reducing the risk for work related injuries.

Good balance between head and handle makes the 90 series adjustable wrenches very comfortable to use.

One piece forged steel handle for extra strength.

The combination adjustable wrench solves many round problems

By removing and turning the moveable jaw you can change the adjustable wrench into a pipe wrench. The largest adjustable wrench offers a firm grip on round objects with a diameter between 5 and 34 mm. The toothed jaw is induction hardened and will bite into even the hardest material. With the moveable jaw in the normal position the adjustable wrench will grip nuts and bolts of up to 34 mm.

The combination adjustable wrench is the perfect solution for loosening rounded nuts and bolts which cannot be gripped with a normal adjustable wrench, spanner or socket. With a combination adjustable wrench in your toolbox, rounded nuts and bolts are no longer a problem.

With the pipe centre opposite the horizontal line on the moveable jaw you can easily read the pipe diameter against the vertical marking.

Quality

There is nothing more irritating for a professional than a tool that breaks, doesn't work or wears out.

Of course this always seems to happen at a critical moment, for example when the job has to be finished by a certain time, when you are at the top of a ladder or when you are 50 miles from the nearest hardware store. That's why you need an adjustable wrench of top professional quality – just like those from Sandvik Bahco!

Our quality control system guarantees that every ergo adjustable wrench you buy is of the same high even quality.

100 years of development work behind today's ergo handtools

Sandvik Bahco has more than a century of experience from heat treatment of special steel and manufacturing adjustable wrenches and other hand tools. By consolidating, using and developing these reserves of knowledge, we have become world leaders in producing new generations of adjustable wrenches that combine good ergonomics with top performance.

The right finish ensures maximum life

The ergo adjustable wrenches are available with different finishes according to the type of rust protection required. The phosphated adjustable wrenches are suitable for all normal use while the chromiumplated adjustable wrenches are more suited to working environments which demand better protection against rust.

First in Europe with the ISO 9001 quality system

Our quality system covers all stages of manufacture from development to delivery. Sandvik Bahco was the first manufacturer of hand tools in Europe to be internationally approved according to the ISO 9001 quality system. This guarantees that every stage of the manufacturing process is right and that our tools live up to your expectations.

ergo – for your own safety

Tools ergonomically designed after scientific studies

Sandvik Bahco guarantees that every handtool that carries the ergo marking has been subjected to a unique scientific, 11 point test programme for ergonomics and function.

The testing programme includes exhaustive tests with users from different professions and trades. The test

group's task is to test a prototype series of the new tool in normal working day conditions. The test results are then carefully analysed by experts in medicine, ergonomics and industrial design. After adjustments, another user test is carried out before the design is finally trade mark protected and the tool is approved

for manufacture. The testing programme ensures that each ergo tool has several unique qualities which increase its usefulness and the pleasure of using it while radically reducing the risk for painful and costly work related injuries.

The original

On May 11th, 1892 J.P. Johansson of Enköping, Sweden was granted the first patent for an "Adjustable wrench" with the same general design as today's modern adjustable wrenches. This laid the foundation for Sandvik Bahco in

Enköping – the factory which today is one of the world's leading manufacturers of adjustable wrenches and pliers. That J.P. Johansson was a mechanical genius is proved by the fact that he had already been given a patent in 1888 for

the pipe wrench and the fact that his adjustable wrench has been developed in only six stages from the patented "Adjustable wrench" of 1892 to today's modern ergonomic adjustable wrenches in the ergo 90-series.
