

Features

- ⊕ Positive-opening safety contacts (IEC 60947-5-1) (not dependent upon springs)
- Mechanically coded actuators utilize two independent operating elements to minimize intentional tampering or defeat
- Rotating head allows actuator engagement from front or back or either of two top positions
- Choice of four standard actuators; special high extraction force actuator is available as option
- IEC IP65 switch housing rating may be increased to IEC IP67 with addition of screw to wiring chamber door
- ☐ Insulated device (IEC 60947-5-1) on all models with plastic housings

Models

Kit Model†	Actuator Type†	Interlock Body†	Contact Configuration (Actuator Engaged)	Contact Configuration (Actuator Removed)	Switching Diagrams
SI-QS90MD	SI-QS-SSA-4 In-Line Stamped	SI-QS90D	One N.C. and One N.O. Contact		
SI-QS90MFD (Direct replacement for models SI-QS90MRHD and SI-QS90MRVD)	SI-QS-SSU Flexible				
SI-QS90MDHF (High Force)††	SI-QS-SSA In-Line Die-Cast	SI-QS90DHF	Two N.C. Contacts		
SI-QS90ME	SI-QS-SSA-4 In-Line Stamped	SI-QS90E	Two N.C. Contacts		
SI-QS90MFE (Direct replacement for models SI-QS90MRHE and SI-QS90MRVE)	SI-QS-SSU Flexible				
SI-QS90MEHF (High Force)††	SI-QS-SSA In-Line Die-Cast	SI-QS90EHF	Two N.C. Contacts		

NOTE: ⊕ This symbol is used in the switching diagrams to identify the point in actuator travel where the normally closed safety contact is fully open.

Contacts: ☐ Open ■ Closed ◐ Transition

† A kit contains an interlock and actuator. Individual interlock bodies or actuators are for replacement purposes only. See Warning on page 10.

†† High Force: 50 N (11.25 lbf) holding force integrated into switch. Use SI-QS-SSA In-Line Actuator only; also see accessory SI-QS-100 on page 9.

Machine Safety Switches – SI-QS75 and SI-QS90 Series Flat Pack Style

Important Information Regarding the Use of Safety Switches

In the United States, the functions that Banner safety switches are intended to perform are regulated by the Occupational Safety and Health Administration (OSHA). Whether or not any particular safety switch installation meets all applicable OSHA requirements depends upon factors that are beyond the control of Banner Engineering Corp. These factors include the details of how the safety switches are applied, installed, wired, operated, and maintained.

Banner Engineering Corp. has attempted to provide complete application, installation, operation, and maintenance instructions. This information is found in the instruction manual packaged with each safety switch. In addition, we suggest that any questions regarding the use or installation of safety switches be directed to the factory applications department at the telephone numbers or address shown below.

Banner Engineering Corp. recommends that safety switches be applied according to the guidelines set forth in international (ISO/IEC) standards listed below. Specifically, Banner Engineering Corp. recommends application of these safety switches in a configuration which meets safety category 4, per ISO 13849 (EN954-1).

In addition, the user of Banner safety switches has the responsibility to ensure that all local, state, and national laws, rules, codes, and regulations relating to the use of Banner safety switches in any particular application are satisfied. Extreme care is urged that all legal requirements have been met and that all installations and maintenance instructions are followed.

Overview

Figure 1. Rotating the actuator head and accessing the wiring chamber

Easy Access

The wiring chamber is accessed via a hinged door. Simply insert a flat-blade screwdriver, as shown, and pry gently down to open.

Rotating Actuator Head

The actuator head may be rotated 180° to create four possible actuator engagement locations. To rotate the head, first open the wiring chamber door, as shown, left. Then, using a small flat-blade screwdriver, dislodge the two locking tabs located on the backside of the switch. Lift the head straight off of the switch body. Rotate the head, as shown, and reinstall it on the switch body.

Machine Safety Switches – SI-QS75 and SI-QS90 Series Flat Pack Style

Mechanical Installation

IMPORTANT: A safety switch must be installed in a manner which discourages tampering or defeat. Mount switches to prevent bypassing of the switching function at the terminal chamber. A switch and its actuator must never be used as a mechanical stop. Overtravel may cause damage to switch.

1. Temporarily mount the switch body in place, with its actuator inserted, using the slotted 5 mm holes. See Figure 2.

NOTE: The slotted holes in the switch body must **ONLY** be used for alignment during installation. The round 5 mm holes (only) must be used for permanent mounting to prevent loosening or displacement of the actuator and the switch body. Only M5 (#10) screws (user supplied), should be used.

2. Slide the switch body on its temporary fasteners to locate and mark the actuator mounting position. Remove the actuator from the switch body and mount it using tamper-resistant 5 mm (#10) hardware (e.g., Torx-head screws, rivets, etc.).

All mounting hardware is supplied by the user. The fasteners must be of sufficient strength to guard against incidental breakage. Use of permanent fasteners or locking hardware is recommended to prevent loosening or displacement of the actuator and switch body.

NOTE: The non-adjustable in-line actuator includes floating sleeves in the mounting holes to allow some forgiveness for switch-to-actuator alignment. Take care to not over-tighten the actuator fasteners so as to allow this movement. This actuator also includes a snap-on cap to cover the fasteners (see Figure 2).

3. Engage the actuator into the switch body. Align them so that the actuator is fully engaged. Fasten the switch body in place using two tamper-resistant 5 mm (#10) screws through the two round holes. Check switch engagement for misalignment and binding.

WARNING . . .

It must not be possible for personnel to reach any hazard point through an opened guard (or any opening) before hazardous machine motion has completely stopped. Please reference OSHA CFR 1910.217 and ANSI B11 standards (see page 2) for information on determining safety distances and safe opening sizes for your guarding devices.

Figure 2. Mounting holes installation

Machine Safety Switches – SI-QS75 and SI-QS90 Series Flat Pack Style

CAUTION . . . Electrical Installation

Two safety switches must be used for each interlock guard to achieve control reliability or Safety Category 4 (per ISO 13849-1, EN 954-1) of a machine stop circuit. Use of only one safety switch per interlock guard is not recommended.

In addition, normally closed safety contacts from each of the two safety switches should be connected to the two separate inputs of a 2-channel safety module or safety interface, as illustrated in Figure 3. This is required to provide monitoring for safety switch contact failure, and to provide the necessary reset routine, as required by IEC 60204-1 and NFPA 79 machine safety standards.

WARNING . . . Series Connection of Safety Interlock Switches

Monitoring multiple guards with a series connection of multiple safety interlock switches is not a Safety Category 4 Application (per ISO 13849-1, EN 954-1). A single failure may be masked or not detected at all. When such a configuration is used, procedures must be performed regularly to verify proper operation of each switch.

Electrical Installation

Access to the Wiring Chamber

The wiring chamber is accessed via the hinged door. See Figure 1. Select the best wiring entrance and thread in the ½" x 14 NPT conduit adapter (supplied), or the optional M20 x 1.5 or M16 x 1.5 cable gland. The switch knockout will break loose with the final turn of the conduit adapter or cable gland (i.e., as it bottoms out).

Connection to a Machine

As illustrated in Figure 3, a normally-closed safety contact (i.e., a safety contact that is closed when the actuator is engaged) **from each of two safety switches per interlock guard** must connect to a 2-channel safety module or safety interface in order to achieve a control reliable interface to the master stop control elements of a machine. Examples of appropriate safety modules include 2-channel emergency stop (E-stop) safety modules and gate monitor safety modules.

Two functions of the safety module or safety interface are:

1. to provide a means of monitoring the contacts of both safety switches for contact failure, and to prevent the machine from restarting if either switch fails; and
2. to provide a reset routine after closing the guard and returning the safety switch contacts to their closed position. This prevents the controlled machinery from restarting by simply reinserting the safety switch actuators. This necessary reset function is required by ANSI B11 and NFPA 79 machine safety standards.

Use only a positively driven, normally closed safety contact from each switch for connection to the safety module. *The normally open contact may be used for control functions that are not safety-related.* A typical use is to communicate with a process controller. Refer to the installation instructions provided with the safety modules for more information regarding the interface of the safety module to the machine stop control elements.

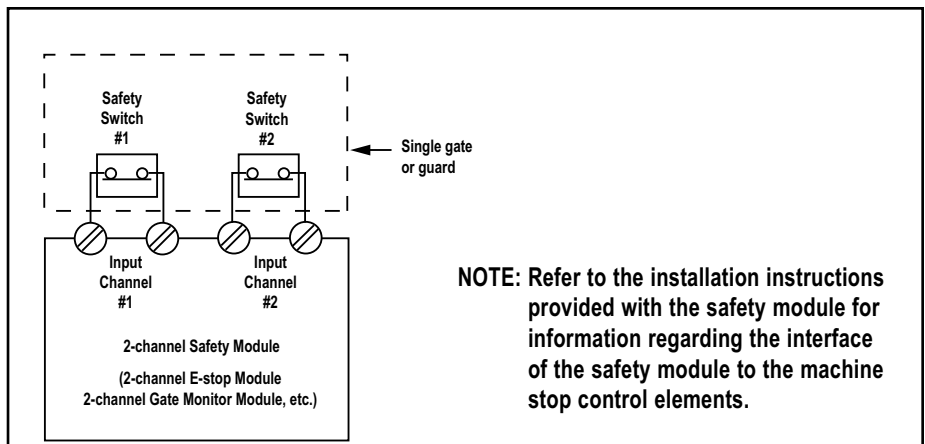

Figure 3. Connect two redundant safety switches per interlock guard to an appropriate 2-channel input safety module.

Machine Safety Switches – SI-QS75 and SI-QS90 Series Flat Pack Style

Periodic Checks

Safety switches should be checked at each shift change or machine setup by a *designated person* (see below) for:

1. Breakage of the switch body or actuator,
2. Good alignment and full engagement of the actuator with the receptor,
3. Confirmation that the safety switch is not being used as an end stop,
4. Loosening of the switch or actuator mounting hardware, and
5. Verification that it is not possible to reach any hazard point through an opened guard (or any opening) before hazardous machine motion has completely stopped.

In addition, a *qualified person* should check for the following on a periodic schedule determined by the user based upon the severity of the operating environment and the frequency of switch actuations:

1. Check the wiring chamber for signs of contamination.
2. Check the contacts for signs of deterioration or damage.
3. Inspect the electrical wiring for continuity and damage.
4. Verify that wiring conforms to the instructions on pages 3 and 4 of this data sheet.

A *designated person* is identified in writing by the employer as being appropriately trained to perform a specified checkout procedure. A *qualified person* possesses a recognized degree or certificate or has extensive knowledge, training, and experience to be able to solve problems relating to the safety switch installation (ANSI B30.2).

Repairs

Do not attempt any repairs to the switch. It contains no field-replaceable components. Return the switch to the factory for warranty repair or replacement.

If it ever becomes necessary to return a switch to the factory, please do the following:

1. Contact the Banner applications engineering department at the number or address listed on the front cover. They will attempt to troubleshoot the system from your description of the problem. If they conclude that a component is defective, they will issue an RMA (Return Merchandise Authorization) number for your paperwork, and give you the proper shipping address.
2. Pack the switch carefully. Damage which occurs in shipping is not covered by warranty.

Contact Material	Silver-nickel alloy														
Maximum Switching Speed	30 operations per minute														
Maximum Actuator Speed	1 m/second (39"/second)														
Minimum Actuator Engagement Radius	In-line actuators: 150 mm (6") Flexible actuators: 50 mm (2") in all directions														
Actuator Extraction Force	High force models: 50 Newtons (11 lbf) All other models: 10 Newtons (2.2 lbf)														
Short Circuit Protection	6 amp Slow Blow, 10 amp Fast Blow. Recommended external fusing or overload protection.														
Mechanical Life	1 million operations														
Wire Connections	Screw terminals with pressure plates accept the following wire sizes – For switches with one or two contacts: Stranded and solid: 20 AWG (0.5 mm ²) to 16 AWG (1.5 mm ²) for one wire Stranded: 20 AWG (0.5 mm ²) to 18 AWG (1.0 mm ²) for two wires For switches with three contacts: Stranded and solid: 20 AWG (0.5 mm ²) to 18 AWG (1.0 mm ²) for one wire Stranded: 20 AWG (0.5 mm ²) to 18 AWG (1.0 mm ²) for two wires														
Cable Entry	SI-QS75 models: M16 x 1.5 threaded entrance SI-QS90 models: M20 x 1.5 threaded entrance Adapter supplied to convert to ½"-14 NPT threaded entrance.														
Construction	Glass fiber-reinforced polyamide thermoplastic housing; UL 94-V0 rating														
Environmental Rating	IEC IP65 NOTE: Addition of a No. 3 x ¼" screw (max) to the wiring access door increases sealing to IEC IP67, NEMA 4X														
Operating Conditions	Temperature: -30° to +80° C (-22° to +176° F)														
Weight	SI-QS75 models: 0.11 kg (0.25 lb) SI-QS90 models: 0.13 kg (0.29 lb)														
Application Notes	Models with one and two contacts have three cable entry locations (bottom and two sides); models with three contacts have two cable entry locations (two sides). All entry locations are sealed with knockouts. To remove knockouts, thread the supplied M16 x 1.5 or M20 x 1.5 to ½"-14 NPT conduit adapter or optional M16 x 1.5 or M20 x 1.5 cable gland into one of the threaded entry locations. The knockout will break open just before the adapter or cable gland bottoms out.

½"-14 NPT Plastic	SI-QS-M16	SI-QS75	M16 x 1.5 to ½"-14 NPT	
½"-14 NPT Plastic	SI-QS-M20	SI-QS90	M20 x 1.5 to ½"-14 NPT	

NOTE: One conduit adapter is supplied with each switch.

Conduit Adapters

Type	Model	Application
High-Force 	SI-QS-100	High-force accessory for in-line actuator SI-QS-SSA. Provides additional holding force for particularly heavy doors, gates, or guards. Adjustable from 50 to 100 Newtons (force). Used only for switches with in-line actuator SI-QS-SSA.

Machine Safety Switches – SI-QS75 and SI-QS90 Series Flat Pack Style

Replacement Actuators		
Type	Model	Application
In-line 	SI-QS-SSA	For doors or covers with a radius of 150 mm (6"), or greater. A one-way snap-on cap is supplied to prevent unauthorized removal of the actuator mounting hardware. The actuator is die-cast stainless steel.
Flexible In-line 		
Flexible 	SI-QS-SSU	For hinged doors with a radius of 50 mm (2") or greater. Flexes in four directions. The actuator is die-cast stainless steel.
Adapter Plate 		
	SI-QS-SSUA	Clear acrylic adapter plate used to retrofit SI-QS-SSU to older flexible actuators SI-QS-HMA and SI-QS-VMA.

WARNING . . .

Spare actuators must NEVER be used to bypass or otherwise defeat the protective function of a safety switch. To do so may create an unsafe situation which could lead to serious injury or death.
