EASY control relay, MFD-Titan

Networking

Addressing the stations:

If all stations are connected, the addresses can be assigned automatically, each station number assigned on the basis of geographical location. Stations can also be addressed individually. The geographical address does not have to match the station address.

Example of a network topology:

4 stations are interconnected. Station address 1 is always the first location. All other station addresses do not have to match the geographical location.

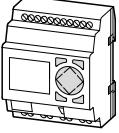

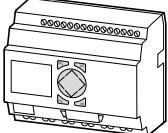

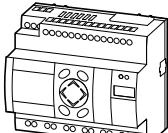

Technical data

- A total of 320 digital inputs and outputs are possible
- 8 stations
- Baud rate: 10 kBit/s to 1000 kBit/s
- Length: up to 1000 m possible
- Modes
 - 1 master (location 1, station address 1), 7 I/O stations
 - Up to
 - 1 master (location 1, station address 1) and 7 intelligent stations
- Transfer of up to 32 double words
- Synchronise time, date
- Direct access to inputs/outputs
- Upload/download program via NET
