## NPN Silicon RF Transistor

- For low current applications
- For oscillators up to 12 GHz
- Noise figure $F=1.25 \mathrm{~dB}$ at 1.8 GHz outstanding $G_{m s}=23 \mathrm{~dB}$ at 1.8 GHz
- Transition frequency $f_{\mathrm{T}}=25 \mathrm{GHz}$

- Gold metallization for high reliability
- SIEGET ® 25 GHz fT - Line

ESD (Electrostatic discharge) sensitive device, observe handling precaution!

## Package Equivalent Circuit:

The SOT343 package has two emitter leads. To avoid high complexity to the package equivalent circuit both leads are combined in one electrical connection

## For non-linear simulation:

- Use transistor chip parameters in Berkeley SPICE 2G. 6 syntax for all simulators.
- If you need simulation of the reverse characteristics, add the diode with the C'-E'- diode data between collector and emitter.
- Simulation of package is not necessary for frequencies $<100 \mathrm{MHz}$.

For higher frequencies add the wiring of package equivalent circuit around the non-linear transistor and diode model.
Note:

- This transistor is constructed in a common emitter configuration. This feature causes an additional reverse biased diode between emitter and collector, which does not effect normal operation.

## Transistor Schematic Diagram

The common emitter configuration shows the following advantages:

- Higher gain because of lower emitter inductance.
- Power is dissipated via the grounded emitter leads, because the chip is mounted on copper emitter leadframe.

Please note, that the broadest lead is the emitter lead.
