SPLC780A1

16COM/40SEG CONTROLLER/DRIVER

GENERAL DESCRIPTION

The SPLC780A1, a dot-matrix LCD controller and driver from SUNPLUS, is a unique design for displaying alpha-numeric, Japanese-Kana characters and symbols. The SPLC780A1 provides two types of interfaces to MPU: 4-bit and 8-bit interfaces. The transferring speed of 8-bit is twice faster than 4-bit. A single SPLC780A1 is able to display up to two 8-character lines. By cascading with SPLC100 or SPLC063, the display capability can be extended. The CMOS technology ensures the power saves in the most efficient way and the performance keeps in the highest rank.

FUNCTION DESCRIPTION

■ OSCILLATOR

SPLC780A1 has a good oscillator that supports not only the internal oscillator operation but also the external clock operation.

■ CONTROL AND DISPLAY INSTRUCTIONS

Control and display instructions will show in details as following:

1. Clear Display

	RS	R/W	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
Code	0	0	0	0	0	0	0	0	0	1

It clears the whole display and sets display data RAM′s address 0 in address counter.

2. Return Home

	RS	R/W	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
Code	0	0	0	0	0	0	0	0	1	X

X: Do not care (0 or 1)

It sets display data RAM′s address 0 in address counter and display returns to its original position. The cursor or blink goes to the left edge of the display (to the 1st line if 2 lines are displayed). The contents of the Display Data RAM do not change.

3. Entry Mode Set

During writing and reading data, it sets cursor move direction and shifts the display.

	RS	R/W	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
Code	0	0	0	0	0	0	0	1	I / D	S

I / D = 1: Increment, I / D = 0: Decrement.

S = 1: The display shift, S = 0: The display does not shift.

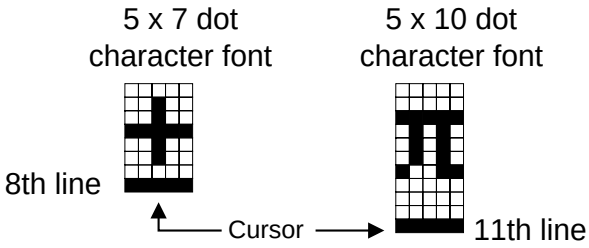
S = 1	I / D = 1	It shifts the display to the left
S = 1	I / D = 0	It shifts the display to the right

4. Display On/Off Control

	RS	R/W	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
Code	0	0	0	0	0	0	1	D	C	B

D = 1: Display on, D = 0: Display off

C = 1: Cursor on , C = 0: Cursor off

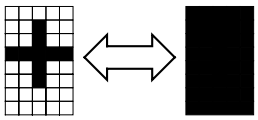


B = 1: Blinks on, B= 0: Blinks off

5. Cursor or Display Shift

Without changing DD RAM′s datas, it can move cursor and shift display.

	RS	R/W	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
Code	0	0	0	0	0	1	S/C	R/L	X	X



Blink display alternately

S/C	R/L	Description	Address Counter
0	0	Shift cursor to the left	AC = AC - 1
0	1	Shift cursor to the right	AC = AC + 1
1	0	Shift display to the left. Cursor follows the display shift	AC = AC
1	1	Shift display to the right. Cursor follows the display shift	AC = AC

6. Function Set

	RS	R/W	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
Code	0	0	0	0	1	DL	N	F	X	X

DL: It sets interface data length.

DL = 1: Datas are transferred with 8-bit lengths (DB7 - 0).

DL = 0: Datas are transferred with 4-bit lengths (DB7 - 4).

(It needs two times to transfer datas)

N: It sets the number of the display line.

N = 0: One-line display.

N = 1: Two-line display.

F: It sets the character font.

F = 0: 5 x 7 dots character font.

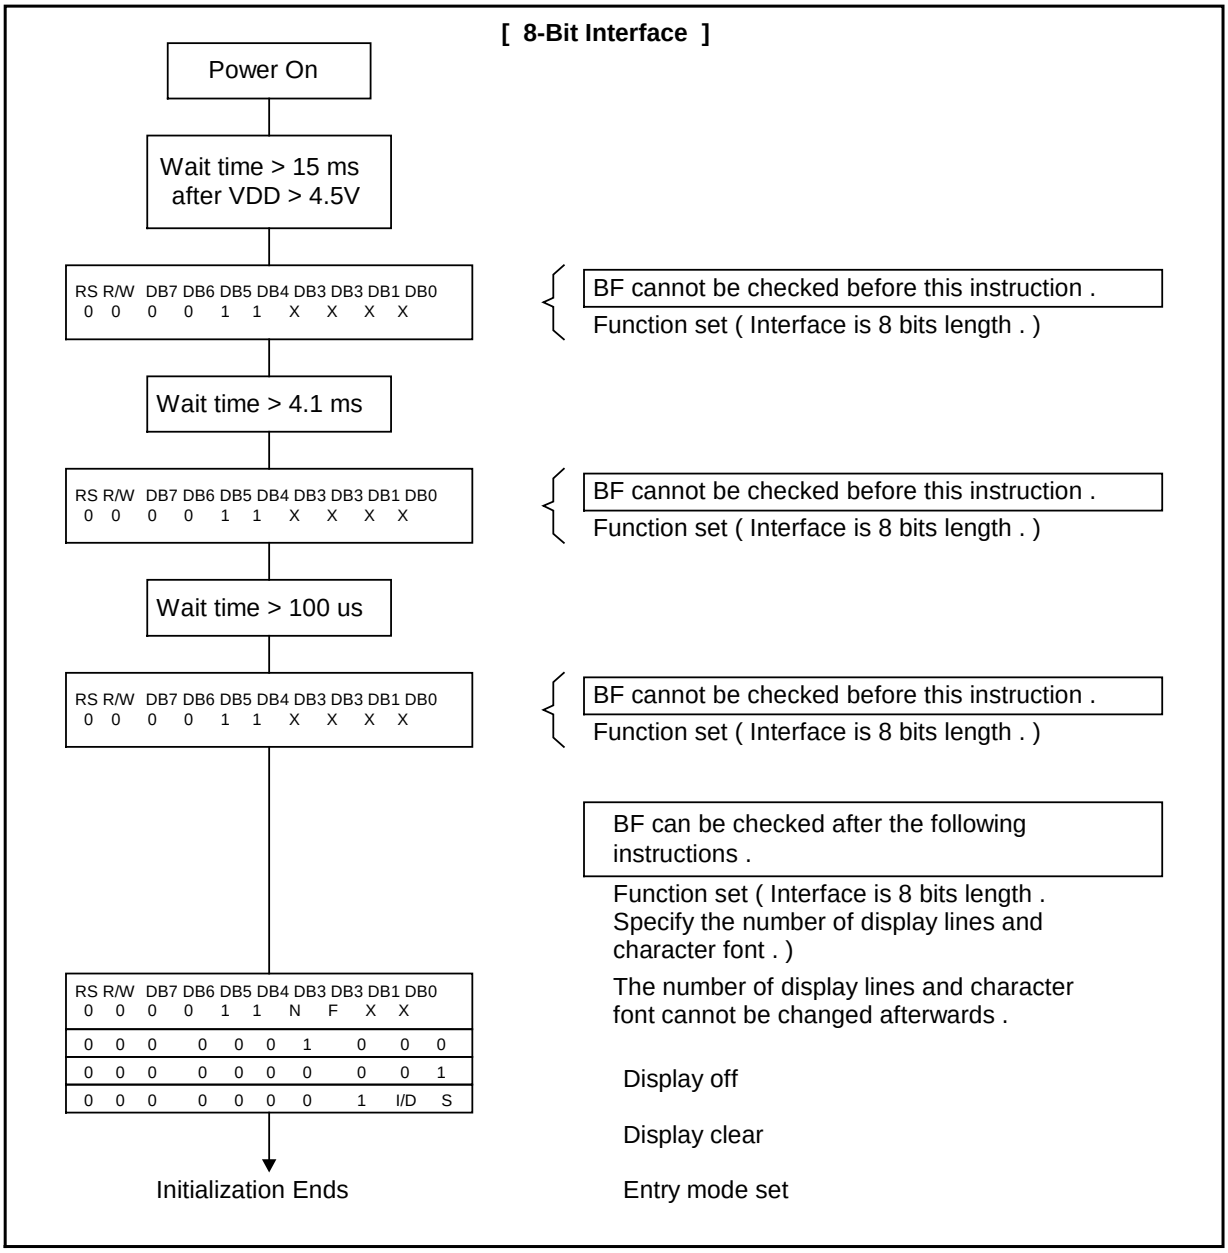
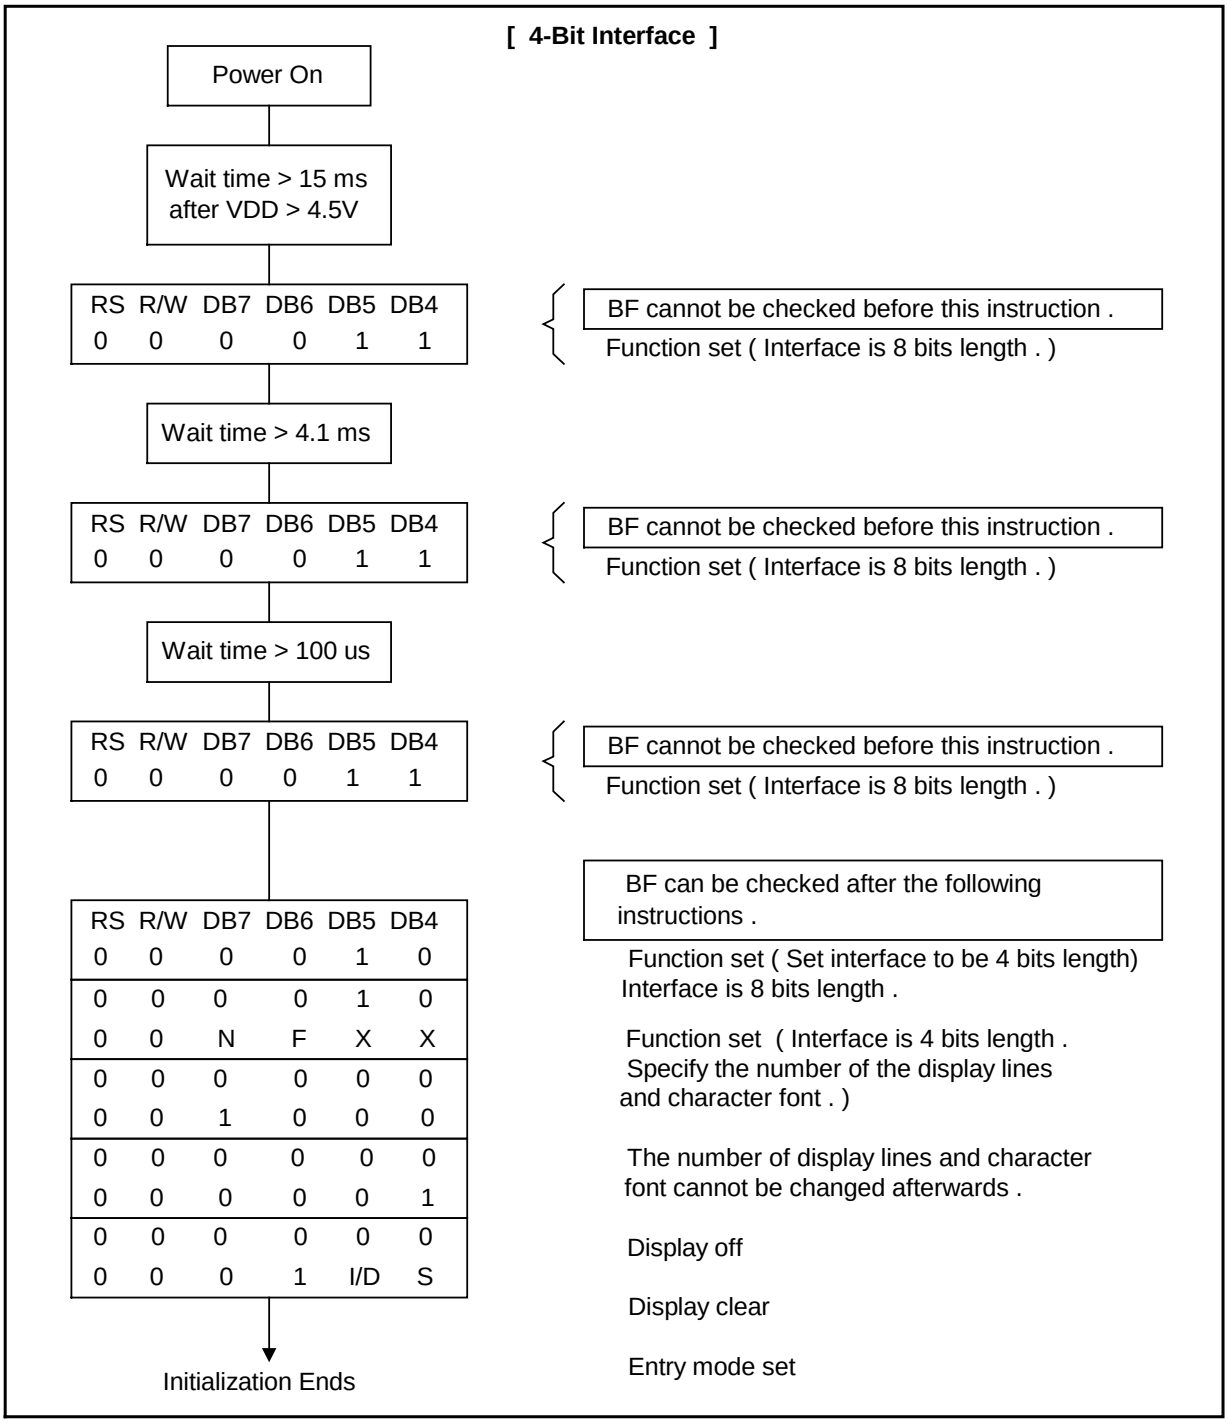
■ RESET FUNCTION

At power on, it starts the internal auto-reset circuit and executes the initial instructions.

There are the initial procedures shown as belows:



[4-Bit Interface]



■ DISPLAY DATA RAM (DD RAM)

The DD RAM stores display data and its RAM size is 80 bytes. The area in DD RAM that is not used for display can be used as a general data RAM. Its address is set in the address counter. There are the relations between the display data RAM′s address and the LCD′s position shown belows.

1-line display , 80 display characters

1	2	3	4	5	6	⋯	79	80
00	01	02	03	04	05	⋯	4E	4F

← Display position

← Display data RAM address

(Example) 1-line display , 8 display characters

1	2	3	4	5	6	7	8
00	01	02	03	04	05	06	07

← Display position

← Display data RAM address

When the display shift operation is performed , the display data RAM's address moves as :

(i) Left shift

01	02	03	04	05	06	06	07	08

(ii) Right shift

4F	00	01	02	03	04	05	06

■ CHARACTER GENERATOR ROM (CG ROM)

Using 8-bit character code, the character generator ROM generates 5 x 7 dot or 5 x 10 dot character patterns. It also can generate 160 5 x 7 dot character patterns and 32 5 x 10 dot character patterns.

■ CHARACTER GENERATOR RAM (CG RAM)

Using the programs, users can easily change the character patterns in the character generator RAM. It can be written with 5 x 7 dots, 8 character patterns or written with 5 x 10 dots, 4 character patterns.

Here are the SPLC780A1′s character patterns shown as belows:

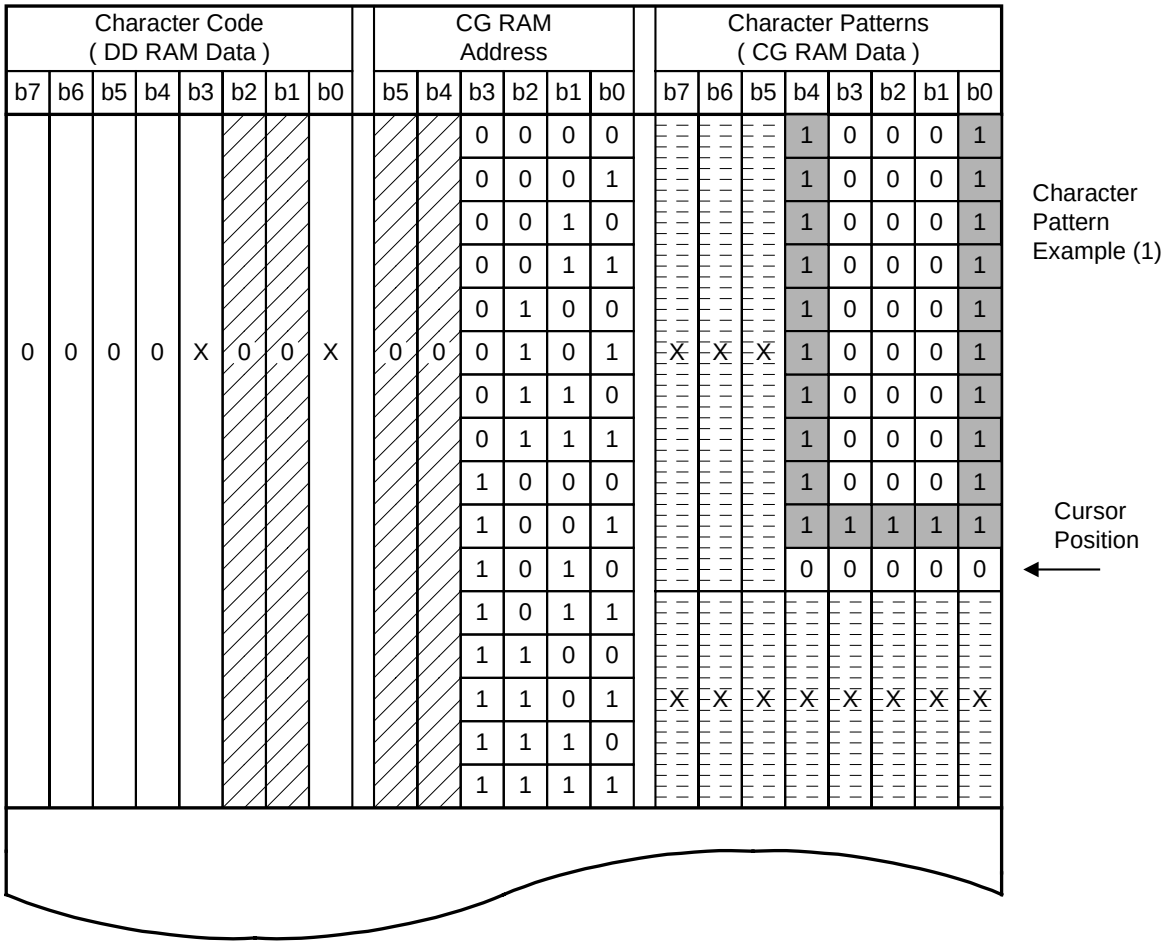
Note :

1. ▨ : It means that the bit0~2 of the character code correspond to the bit3~5 of the CG RAM address .
2. ▤ : These areas are not used for display , but can be used for the general data RAM .
3. When all of the bit4-7 of the character code are 0 , CG RAM character patterns are selected .
4. " 1 " : Selected , " 0 " : No selected , " X " : Do not care (0 or 1) .
5. For example (1), to set character code (b2 = b1 = b0 = 0, b3 = 0 or 1, b7-b4 = 0) is to display " T ". That means character code $(00)_{16}$,and $(08)_{16}$ can display " T " character.
6. The bits 0-2 of the character code RAM is character pattern line position. The 8th line is the cursor position and display is formed by logical OR with the cursor.

5 X 10 dot character patterns



Note :

1.  : It means that the bit1~2 of the character code correspond to the bit4~5 of the CG RAM address .
2.  : These areas are not used for display , but can be used for the general data RAM .
3. When all of the bit4-7 of the character code are 0 , CG RAM character patterns are selected .
4. " 1 " : Selected , " 0 " : No selected , " X " : Do not care (0 or 1) .
5. For example (1), to set character code (b2 = b1 = 0, b3 = b0 = 0 or 1, b7-b4 = 0) is to display " U ". That means all of the character codes $(00)_{16}$, $(01)_{16}$, $(08)_{16}$,and $(09)_{16}$ can display " U " character.
6. The bits 0-3 of the character code RAM is character pattern line position. The 11th line is the cursor position and display is formed by logical OR with the cursor.

■ TIMING GENERATION CIRCUIT

The timing generation circuit can generate needed timing signals to the internal circuits. In order to prevent the internal timing interface, the MPU access timing and the RAM access timing are separately generated.

■ LCD DRIVER CIRCUIT

There are 16 commons x 40 segments signal drivers in the LCD driver circuit. When a program specifies the character fonts and line numbers, the corresponding common signals will output drive waveforms and the others still output unselected waveforms.

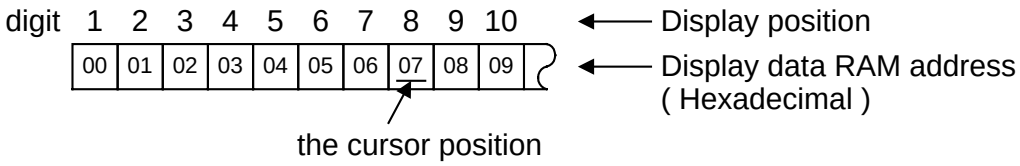
■ CURSOR / BLINK CONTROL CIRCUIT

It can generate the cursor or blink in the cursor / blink control circuit. The cursor or the blink appears in the digit at the display data RAM address set in the address counter.

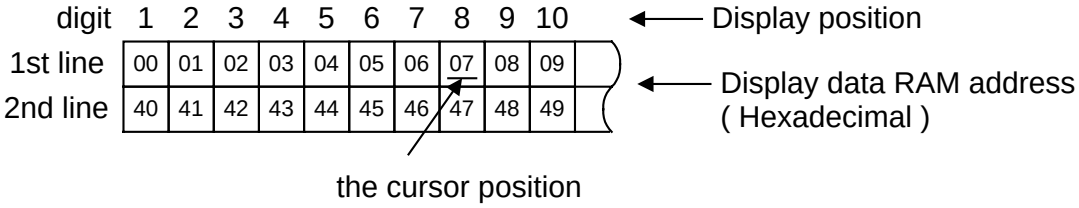
When the address counter is $(07)_{16,}$ the cursor's position is shown as belows:

	b6	b5	b4	b3	b2	b1	b0
AC	0	0	0	0	1	1	1

In a 1-line display



In a 2-line display



■ INTERFACING TO MPU

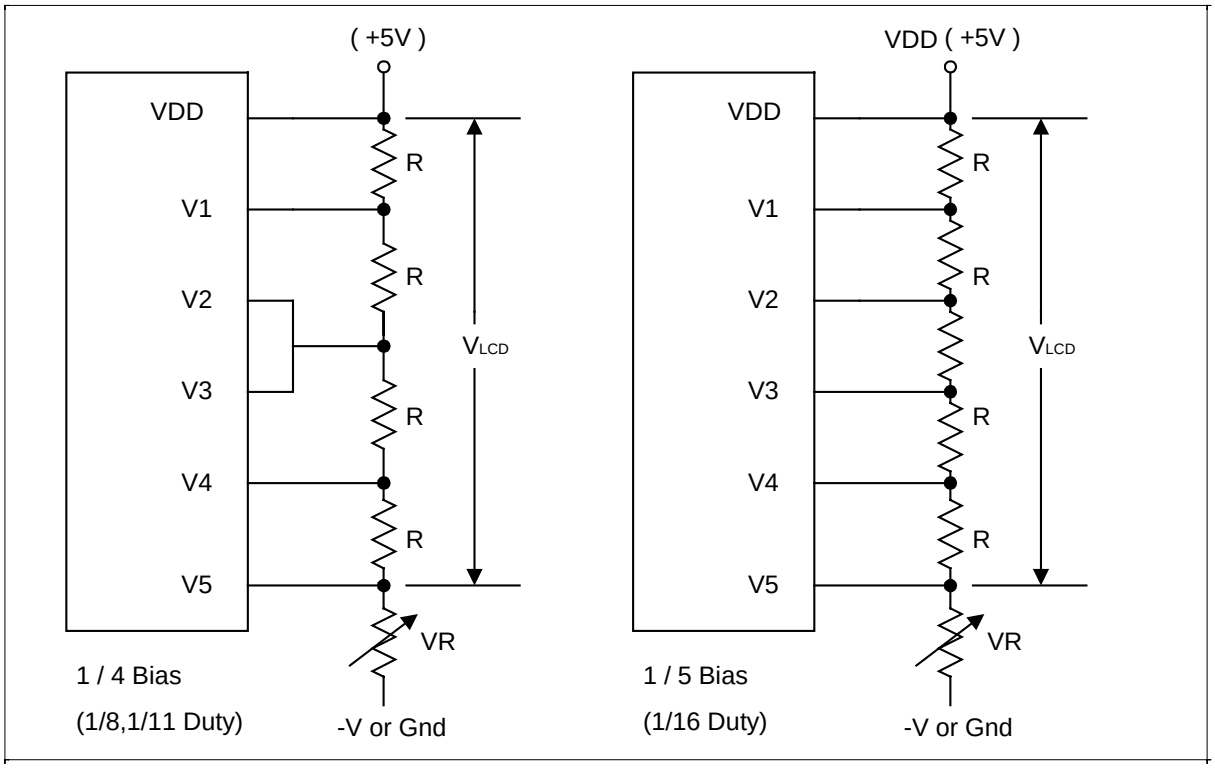
There are two kinds of data operations - one is 4-bit operations, the other is 8-bit operations. Using 4-bit MPU, the interfacing 4-bit datas are transferred by 4-busline (DB7 - 4). DB3 - 0 buslines are not used. Using 4-bit MPU to interface 8-bit datas needs two times. First, the higher order 4-bit datas are transferred by 4-busline (DB7 - 4). Secondly, the lower order 4-bit datas are transferred by 4-busline (DB3 - 0). Using 8-bit MPU, the interfacing 8-bit datas are transferred by 8-buslines (DB7 - 0).

■ SUPPLY VOLTAGE FOR LCD DRIVE

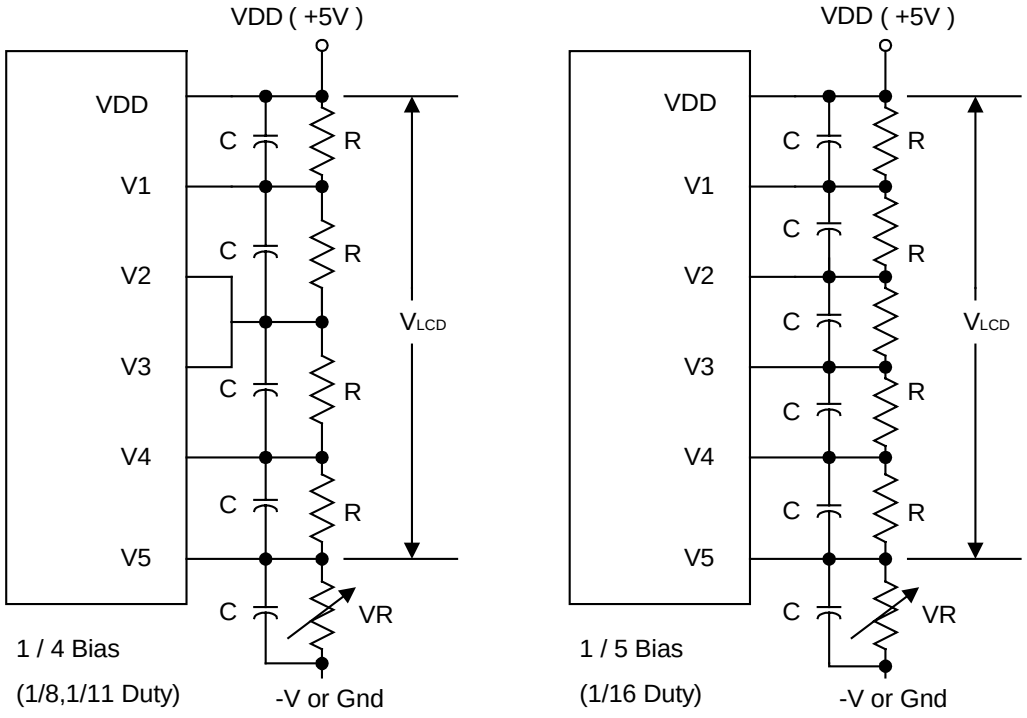
There are different voltages that supply to SPLC780A1's pins (V5 - 1) to obtain LCD drive waveform. The relations of the bias, duty factor and supply voltages are shown as belows:

Duty Factor / Supply Voltage \ Bias	1 / 8 , 1 / 11	1 / 16
	1 / 4	1 / 5
V1	VDD - 1/4 V_{LCD}	VDD - 1/5 V_{LCD}
V2	VDD - 1/2 V_{LCD}	VDD - 2/5 V_{LCD}
V3	VDD - 1/2 V_{LCD}	VDD - 3/5 V_{LCD}
V4	VDD - 3/4 V_{LCD}	VDD - 4/5 V_{LCD}
V5	VDD - V_{LCD}	VDD - V_{LCD}

— **The power connections for LCD (1/4 Bias, 1/5 Bias) are shown belows:**



The bypass-capacitor can improve the LCD display's quality.



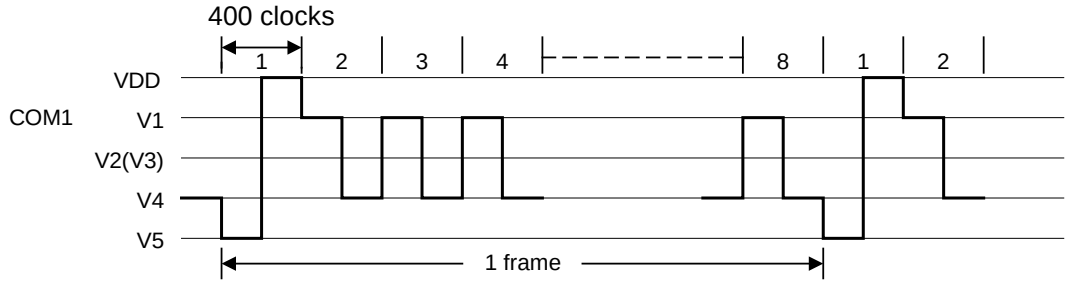
The bias voltage must have the following relations:

VDD > V1 > V2 ≧ V3 > V4 > V5, V5 ≦0 (volt).

— **The relations between LCD frame's frequency and oscillator's frequency**

(Assume the oscillation frequency is 250KHz, 1 clock cycle time = 4 μs)

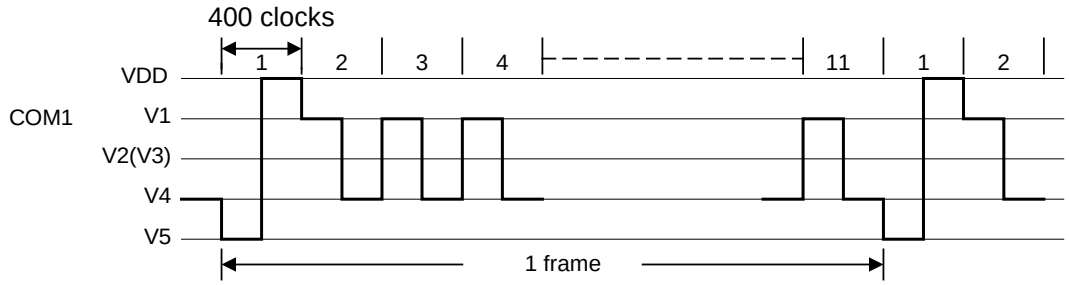
1. 1 / 8 Duty



1 frame = 4 (μs) x 400 x 8 = 12800 (μs) = 12.8 ms

Frame frequency = $\frac{1}{12.8\ (ms)}$ = 78.1 (Hz)

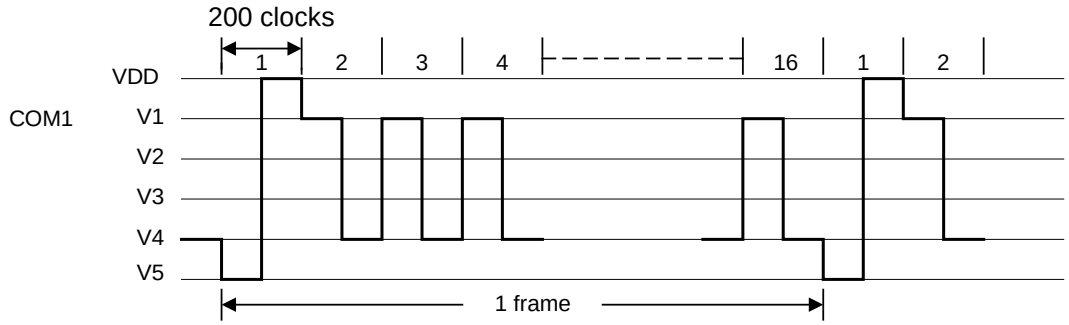
2. 1 / 11 Duty



1 frame = 4 (μs) x 400 x 11 = 17600 (μs) = 17.6 ms

Frame frequency = $\frac{1}{17.6\ (ms)}$ = 56.8 (Hz)

3. 1 / 16 Duty



1 frame = 4 (μs) x 200 x 16 = 12800 (μs) = 12.8 ms

Frame frequency = $\frac{1}{12.8\ (ms)}$ = 78.1 (Hz)

■ **REGISTER --- IR (Instruction Register) and DR (Data Register)**

SPLC780A1 has two 8-bit registers - IR (instruction register) and DR (data register).

In the followings, we can use the combinations of the RS pin and the R/W pin to select the IR and DR.

RS	R/W	Operation
0	0	IR write(Display clear, etc.)
0	1	Read busy flag (DB7) and address counter (DB6 - 0)
1	0	DR write (DR to Display data RAM or Character generator RAM)
1	1	DR read (Display data RAM or Character generator RAM to DR)

The IR can be written from the MPU but cannot read by the MPU.

■ **BUSY FLAG (BF)**

When RS = 0 and R/W = 1, the busy flag is output to DB7.

As the busy flag =1, SPLC780A1 is in busy state and does not accept any instructions until the busy flag = 0.

■ **ADDRESS COUNTER (AC)**

The address counter assigns addresses to display data RAM and character generator RAM. When an instruction for address is written in IR, the address information is sent from IR to AC. After writing into (or reading from) display data RAM or character generator RAM, AC is automatically incremented by+1 (or decremented by -1). AC contents are output to DB6 - DB0 when RS = 0 and R/W = 1.

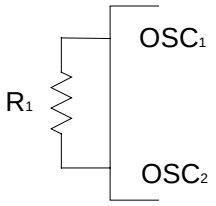
APPLICATION NOTES

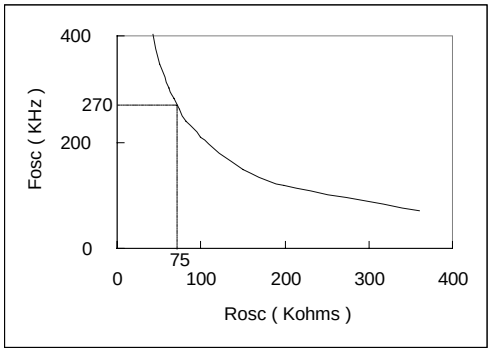
■ R-OSCILLATOR

The oscillation resistor R_f is used only for the internal oscillaotr operation mode.

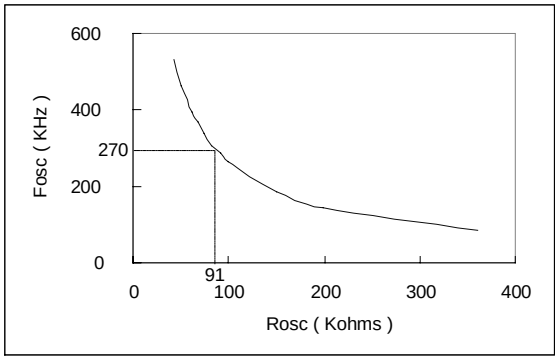


R_f : 75KΩ ± 2% (when VDD = 3V)
R_f : 91KΩ ± 2% (when VDD = 5V)

Since the oscillation frequency varies depending on the OSC_1 and OSC_2 pin capacitance, the wiring length to these pins should be minimized.



VDD = 3V



VDD = 5V
