

Silicon Photo Darlington in Miniature 1206 SMD Package

OP520DA, OP521DA

Features:

- High Photo Sensitivity
- Fast Response Time
- 1206 Package Size
- Opaque or Water Clear Flat Lens
- High Current Gain

Descriptions:

The **OP520DA** and **OP521DA** are NPN silicon photo darlington mounted in miniature 1206 SMD packages. Both the **OP520DA** and **OP521DA** have a flat lens however, the **OP520DA** lens are opaque to shield the device from ambient light unlike the lens of the **OP521DA**. These sensors are packaged in compact 1206 size chip carriers that are compatible with most automated mounting equipment. The **OP520DA** and **OP521DA** are mechanically and spectrally matched to the OP250 series infrared LEDs.

Since these devices have a flat window lens, they enable a wide acceptance angle. It is packaged in a plastic leadless chip carrier which is compatible for new applications with that need smaller dimension packages for automated mounting and detection equipment with new innovative designs. **OP520DA** and **OP521DA** are 100% production tested using infrared light for close correlation with Optek GaAs and GaAlAs emitters. Photo darlington devices are normally used in application where light signals are low and more current gain is needed than in comparison to the standard phototransistors.

Applications

- Non-Contact Position Sensing
- Datum detection
- Machine automation
- Optical encoders

Absolute Maximum Ratings $T_A = 25^\circ\text{C}$ unless otherwise noted

Storage Temperature Range	-40° C to +100° C
Operating Temperature Range	-25° C to +85° C
Lead Soldering Temperature	260° C ⁽¹⁾
Collector-Emitter Voltage	35V
Emitter-Collector Voltage	5 V
Collector Current	30 mA
Power Dissipation	100 mW ⁽²⁾

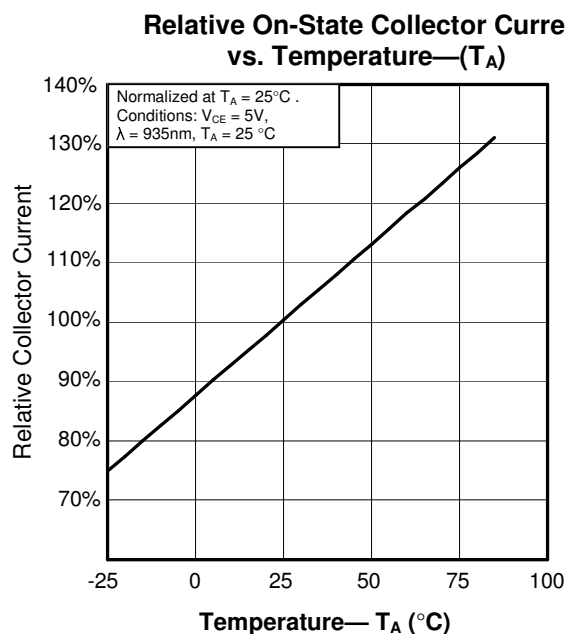

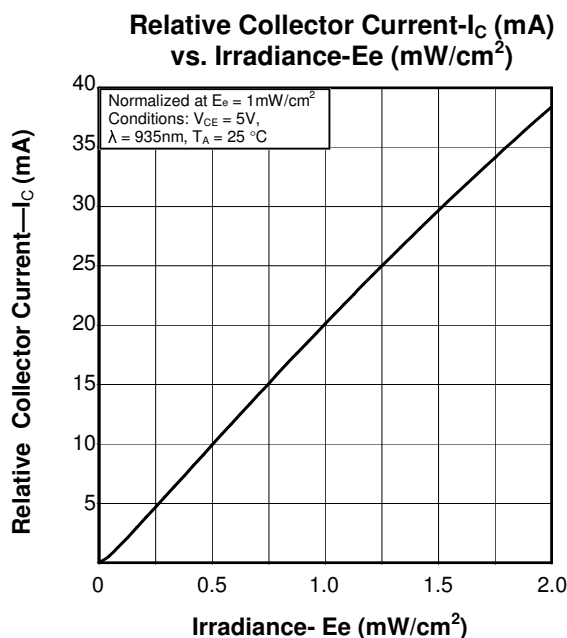

Notes:

- Solder time less than 5 seconds at temperature extreme.
- De-rate linearly at 2.17 mW/°C above 25° C.

- Light source is an unfiltered GaAs LED with a peak emission wavelength of 935nm and a radiometric intensity level which varies less than 10% over the entire lens surface of the photo darlington being tested.
- To Calculate typical collector dark current in μA , use the formula $I_{CEO} = 10^{(0.04 T_A - 3/4)}$ where T_A is the ambient temperature in °C.
