# High Voltage Dual EL Lamp Driver 

## Features

- Independent input control for lamp selection
- Split supply capability
- Patented output timing
- One miniature inductor to power both lamps
- Low shutdown current
- Wide input voltage range 2.0 V to 5.0 V
- Output voltage regulation
- No SCR output
- Available in 10-Lead MSOP package

## Applications

- Mobile cellular phones, dual display
- Keypad and LCD backlighting
- Portable instrumentation
- Dual segment lamps
- Hand held wireless communication devices

## General Description

The Supertex HV831 is a high voltage driver designed for driving two EL lamps with a combined area of 3.5 square inches. The input supply voltage range is from 2.0 to 5.0 V . The device is designed to reduce the amount of audible noise emitted by the lamp. This device uses a single inductor and minimum number of passive components to drive two EL lamps. The nominal regulated output voltage of $\pm 80 \mathrm{~V}$ is applied to the EL lamps. The two EL lamps can be turned on and off by the two logic input control pins, C1 and C2. The device is disabled when both C1 and C2 (pins 1 and 4) are at logic low.
The HV831 has an internal oscillator, a switching MOSFET, and two high voltage ELlamp drivers. An external resistor connected between the RSW-OSC and the voltage supply pin VDD sets the frequency for the switching MOSFET. The EL lamp driver frequency is set by dividing the MOSFET switching frequency by 128. An external inductor is connected between the LX and the VDD pins. Depending on the EL lamp size, a 1.0 to $10.0 \mathrm{nF}, 100 \mathrm{~V}$ capacitor is connected between CS and Ground. The two EL lamps are connected between EL1 to Com and EL2 to Com.
The switching MOSFET charges the external inductor and discharges it into the capacitor at CS. The voltage at CS increases. Once the voltage at CS reaches a nominal value of 80 V , the switching MOSFET is turned off to conserve power. The outputs EL1 to Com and EL2 to Com are configured as H bridges and switch in opposite states to achieve 160 V across the EL lamp.

## Typical Application Circuit

1. The bigger sized lamp should be tied to EL1 and the smaller sized lamp to EL2 terminals (pins 10 and 9 respectively)

Ordering Information

|  | Package Option |
| :---: | :---: |
| Device | 10-Lead MSOP |
|  | $3.00 \times 3.00 \mathrm{~mm}$ body |
|  | 1.10mm height (max) |
|  | 0.50mm pitch |
| HV831 | HV831MG-G |

-G indicates package is RoHS compliant ('Green')

## Absolute Maximum Ratings

| Parameter | Value |
| :--- | ---: |
| Supply voltage, $\mathrm{V}_{\mathrm{DD}}$ | -0.5 to +7.5 V |
| Supply voltage, $\mathrm{V}_{\mathrm{CS}}$ | -0.5 to +120 V |
| Operating ambient temperature range | $-40^{\circ} \mathrm{C}$ to $+85^{\circ} \mathrm{C}$ |
| Storage temperature range | $-65^{\circ}$ to $+150^{\circ} \mathrm{C}$ |
| Power dissipation 10-Lead MSOP | 250 mW |

Absolute Maximum Ratings are those values beyond which damage to the device may occur. Functional operation under these conditions is not implied. Continuous operation of the device at the absolute rating level may affect device reliability. All voltages are referenced to device ground, GND

## Thermal Resistance

| Package | $\boldsymbol{\theta}_{j a}$ |
| :---: | :---: |
| MSOP-10 | $400^{\circ} \mathrm{C} / \mathrm{W}$ |

(Mounted on FR4 board, $25 \mathrm{~mm} \times 25 \mathrm{~mm} \times 1.57 \mathrm{~mm}$ )

Pin Configuration

## Product Marking

Function Table

## Functional Block Diagram

Figure 1: Test Circuit

## Split Supply Configuration

The HV831 can be used in applications operating from a battery where a regulated voltage is available. This is shown in Figure 2. The regulated voltage can be used to drive the internal logic of HV831. The amount of current used to drive
the internal logic is less than $150 \mu \mathrm{~A}$. Therefore, the regulated voltage could easily provide the current without being loaded down.

Figure 2: Split Supply Configuration

1. The bigger sized lamp should be tied to EL1 and the smaller sized lamp to EL2 terminals (pins 10 and 9 respectively)

## Audible Noise Reduction

This section describes a method (patented) developed at Supertex to reduce the audible noise emitted by the EL lamps used in application sensitive to audible noise. The waveform takes the shape of approximately $2 R C$ time constants for rising and 2RC time constants for falling, where $C$ is the capacitance of the EL lamp, and $R$ is the external resistor,
$\mathrm{R}_{\text {SER }}$ connected in series with the EL lamp.
Figure 3 shows a general circuit schematic that uses the series resistors, $R_{\text {SER1 }}$ and $R_{\text {SER2 }}$, for each of the EL lamps. $\mathrm{R}_{\mathrm{SER} 1}$ and $\mathrm{R}_{\mathrm{SER} 2}$ are connected in series with the EL lamp. The audible noise can be set a desirable level by selecting the resistances for $R_{\text {SER } 1}$ and $R_{\text {SER2 }}$. It is important to note

## Figure 3: Typical Application Circuit For Audible Noise Reduction

## Typical HV831 Performance Curves

(When driving both $E L$ Lamps, $E L_{1}$ Lamp $=1.3 i n^{2}, E L_{2} \operatorname{Lamp}=0.93 i i^{2}, V_{D D}=3.0 \mathrm{~V}$ )

## Pin Configuration and Description

| Pin \# | Name | Function |
| :---: | :---: | :---: |
| 1 | C1 | Enable input signal for EL lamp 1. Logic high will turn ON the EL lamp 1 and logic low will turn it OFF. Refer to the Function Table. |
| 2 | VDD | Input supply voltage pin. |
| 3 | RSW-Osc | External resistor connection to set both the switching MOSFET frequency and EL Lamp frequency. The external resistor should be connected between this pin and the $\mathrm{V}_{\mathrm{DD}}$ pin. The EL lamp frequency is switching frequency divided by 128. <br> The switching frequency increases as the value of $R_{\text {sw-osc }}$ decreases. A $470 \mathrm{k} \Omega$ resistor wilt provide a switching frequency of 31.2 kHz , and an EL lamp frequency of 244 Hz . To change the frequency to $f_{\text {sw1 }}$, the value of the resistor $R_{\text {sw-osc } 1}$ can be determined as $R_{\text {sw-osc } 1}=(470 \times 244)$ $/ \mathrm{f}_{\mathrm{EL}} \mathrm{M} \Omega$. |
| 4 | C2 | Enable input signal for EL lamp 2. Logic high will turn ON the EL lamp 2 and logic low will turn it OFF. Refer to the Function Table. |
| 5 | GND | IC Ground Pin. |
| 6 |  | External inductor connection to boost the low input voltage using inductive flyback. Connect an inductor between VIN and this pin. Also connect a high voltage fast recovery diode between this pin and the CS pin. The anode of the diode needs to be connected to the LX pin and the cathode to the CS pin. In general, small valued inductors, which can handle more current, are more suitable for driving large sized lamps. As the inductor value decreases, the switching frequency should be increased to avoid saturation. <br> When the switching MOSFET is turned ON, the inductor is being charged. When the MOSFET is turned OFF, the energy stored in the inductor is transferred to the high voltage capacitor connected at the CS pin. |
|  | CS | Connect a 100 V capacitor between this pin and GND. This capacitor stores the energy transferred from the inductor. |
| 8 | COM | Common connection for both EL lamps. Connect one end of both the lamps to this pin. |
| 9 | EL2 | EL lamp 2 connection. For optimum performance, the smaller of the two lamps should be connected to this pin. |
| 10 | EL1 | EL lamp 1 connection. For optimum performance, the larger of the two lamps should be connected to this pin. |
