## MAX1790 Evaluation Kit

**Evaluates: MAX1790**

### General Description

The MAX1790 evaluation kit (EV kit) is a fully assembled and tested surface-mount circuit board that contains a fixed-frequency, pulse-width-modulated (PWM), step-up DC-DC converter. The EV kit provides a +5V output voltage from an input as low as +2.6V. It delivers up to 500mA output current. The MAX1790 features an internal MOSFET switch, programmable soft-start, and fast transient response.

The MAX1790 EV kit provides low quiescent current and high efficiency for maximum battery life. Operation at 640kHz allows the use of a tiny surface-mount inductor.

### Quick Start

The MAX1790 EV kit is fully assembled and tested. Follow these steps to verify board operation. **Do not turn on the power supply until all connections are completed.**

- 1) Connect a +2.6V to +5V supply to the VIN pad. Connect ground to the GND pad.
- 2) Connect a voltmeter to the VOUT pad.
- 3) Verify that the shunt is across JU1 pins 1 and 2 to enable the MAX1790.
- 4) Turn on the power supply and verify that the output is at +5V.

## Detailed Description

### Shutdown Mode

The EV kit features a shutdown mode that reduces the MAX1790 quiescent current to 0.1µA, preserving battery life. The three-pin header, JU1, selects the shutdown mode (Table 1).

### Evaluating Other Output Voltages

The EV kit output is programmed to 5V. However, the output voltage can also be adjusted from  $V_{IN}$  to 12V by selecting R1 and R2 values. R2 can have a value up to 500kΩ without sacrificing accuracy. R1 is then given by:

$$R1 = R2 [(V_{OUT} / V_{FB}) - 1]$$

where  $V_{FB} = 1.24V$ .

Refer to the *Application Circuits* section of the MAX1790 data sheet for different output voltage circuits.

### Switching Frequency Selection

The MAX1790 is shipped to operate at 640kHz. The switching frequency can be changed to 1.2MHz by installing jumper JU2 (Table 2). Refer to the MAX1790 data sheet for selecting the proper components to operate at 1.2MHz.

Table 1. Jumper JU1 Functions

SHUNT LOCATION	$\overline{\text{SHDN}}$ PIN	MAX1790 OUTPUT
1-2	Connected to $V_{IN}$	MAX1790 enabled, $V_{OUT} = +5V$
2-3	Connected to GND	Shutdown mode, $V_{OUT} = V_{IN} - V_{DIODE}$

Table 2. Frequency Pin Setting

SHUNT LOCATION	FREQUENCY PIN	SWITCHING FREQUENCY
Installed	Connected to $V_{IN}$	1.2MHz
Not installed	Floating	640kHz
