

Complete Single-Conversion Television Tuner

## General Description

The MAX3542 complete single-conversion television tuner is designed for use in analog/digital terrestrial applications and digital set-top boxes. This television tuner draws only 760 mW of power from a +3.3 V supply voltage.
The MAX3542 is designed to convert PAL or DVB-T signals in the 47 MHz to 862 MHz band to an intermediate frequency (IF) of 36 MHz .
The MAX3542 includes a variable-gain low-noise amplifier (LNA), multiband tracking filters, a harmonic-rejection mixer, a low-noise IF amplifier, an IF power detector, and a variable-gain IF amplifier. The MAX3542 also includes fully monolithic VCOs and tank circuits, as well as a complete frequency synthesizer. This highly integrated design allows for low-power tuner-on-board applications without the cost and power dissipation issues of dualconversion tuner solutions.

The MAX3542 is specified for operation in the $0^{\circ} \mathrm{C}$ to $+70^{\circ} \mathrm{C}$ temperature range and is available in a lead-free 48-pin flip-chip (fcLGA) package.

## Applications

Televisions
Analog/Digital Terrestrial Receivers
Digital Set-Top Boxes
Pin Configuration/Functional Diagram

## Complete Single-Conversion Television Tuner

## ABSOLUTE MAXIMUM RATINGS

VCC to GND .............................................................-0.3V, +3.6
UHF_IN, VHF_IN, IFIN_, IFOUT1_, IFOUT2_, IFAGC RFAGC, VTUNE, LDO, MUX, CP, XTAL_ to GND
-0.3 V to (Vcc + 0.3V)
SDA, SCL, ADDR2, ADDR1 to GND......................-0.3V to +3.6 V
IFOUT__ Short-Circuit Duration .....................................Indefinite
RF Input Power ............................................................. +10 dBm

| Continuous Power Dissipation ( $\left.\mathrm{T}_{\mathrm{A}}=+70^{\circ} \mathrm{C}\right)$ |  |
| :---: | :---: |
| 48-Pin LGA (derate $25 \mathrm{~mW} /{ }^{\circ} \mathrm{C}$ above $+70^{\circ}$ |  |
| Operating Temperature Range........................... $0^{\circ} \mathrm{C}$ to $+70^{\circ} \mathrm{C}$ | C to $+70^{\circ} \mathrm{C}$ |
| Junction Temperature |  |
| Storage Temperature Range .......................... $65^{\circ} \mathrm{C}$ to $+165^{\circ} \mathrm{C}$ |  |
| Lead Temperature (soldering, 10s) |  |
|  |  |

Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.
caution! ESD SENSITIVE device

## DC ELECTRICAL CHARACTERISTICS

(MAX3542 EV kit, VCC $=+3.1 \mathrm{~V}$ to $+3.5 \mathrm{~V}, \mathrm{~T}_{\mathrm{A}}=0^{\circ} \mathrm{C}$ to $+70^{\circ} \mathrm{C}$, no RF signals at RF inputs, default register settings, $\mathrm{V}_{\text {RFAGC }}=\mathrm{V}_{\text {IFAGC }}=$ +3 V (minimum attenuation), unless otherwise noted. Typical values are at $\mathrm{V}_{\mathrm{CC}}=+3.3 \mathrm{~V}, \mathrm{~T}_{\mathrm{A}}=+25^{\circ} \mathrm{C}$, unless otherwise noted.) (Note 1)

| PARAMETER | CONDITIONS | MIN TYP MAX | UNITS |
| :---: | :---: | :---: | :---: |
| SUPPLY VOLTAGE AND CURRENT |  |  |  |
| Supply Voltage |  | +3.1 +3.5 | V |
| Supply Current | Receive mode | 230275 | mA |
|  | Shutdown mode | 5 |  |
| RF and IF AGC Input Bias Current | At +0.5 V and +3 V | -50 +50 | $\mu \mathrm{A}$ |
| RF and IF AGC Control Voltage (Note 2) | Minimum attenuation | +3 | V |
|  | Maximum attenuation | +0.5 |  |

Pin Description

| PIN | NAME |  |
| :---: | :---: | :--- |
| 1 | SCL | 2-Wire Serial-Clock Interface. Requires a pullup resistor to VCC. |
| 2 | SDA | 2-Wire Serial-Data Interface. Requires a pullup resistor to VCC. |
| $3,10,23,28$, <br> $32,33,37$, <br> 41,44 | VCC | Power-Supply Connections. Bypass each supply pin to ground with a 1000pF capacitor. |
| 4 | UHF_IN | UHF RF Input. Requires a DC-blocking capacitor. |
| 5 | VHF_IN | VHF RF Input. Requires a DC-blocking capacitor. |
| 6 | RFGND2 | RF Ground. Bypass to the PCB's ground plane with a 1000pF capacitor. Do not connect RFGND2 <br> and RFGND3 together. |
| 7 | LEXT | RF VGA Supply Voltage. Connect through a 270nH pullup inductor to VCc. |
| 8 | RFGND3 | RF Ground. Bypass to the PCB's ground plane with a 1000pF capacitor. Do not connect RFGND2 <br> and RFGND3 together. |
| 9 | RFAGC | RF VGA Gain Control Voltage. Accepts a DC voltage from 0.5V (minimum gain) to 3V (maximum gain). |
| $11-22,27,31$ | GND | Ground. Connect to the PCB's ground plane. |
| 24 | IFOUT2- | Inverting IF VGA Output. Connect to the input of an anti-aliasing filter. Requires a DC-blocking capacitor. |
| 25 | IFOUT2+ | Noninverting IF VGA Output. Connect to the input of an anti-aliasing filter. Requires a DC-blocking capacitor. |
| 26 | IFAGC | IF VGA Gain Control Voltage. Accepts a DC voltage from 0.5V (minimum gain) to 3V (maximum gain). |
| 29 | IFIN- | Inverting IF VGA Input. Connect to the output of an IF-SAW filter. |
| 30 | IFIN+ | Noninverting IF VGA Input. Connect to the output of an IF-SAW filter. |
| 34 | IFOVLD | IF Overload Detector Open-Collector Output. Requires a 10k pullup resistor to VCC. |
| 35 | IFOUT1+ | Noninverting IF LNA Output. Requires a DC-blocking capacitor. |
| 36 | IFOUT1- | Inverting IF LNA Output. Requires a DC-blocking capacitor. |
| 38 | LDO | VCO LDO Bypass. Bypass to ground with a 0.47 F capacitor. |

# Complete Single-Conversion Television Tuner 

Pin Description (continued)

| PIN | NAME | FUNCTION |
| :---: | :---: | :--- |
| 39 | GND_TUNE | VTUNE Ground Connection. Connect to the PCB ground plane. All loop filter component GNDs must <br> be connected to this pin (see the Typical Application Circuit). |
| 40 | VTUNE | VCO Tuning Input. Connect to the PLL loop filter output. |
| 42 | MUX | Test Output. Leave this pin unconnected during normal operation. |
| 43 | CP | Charge-Pump Output. Connect to PLL loop filter input. |
| 45 | XTALN | Crystal Oscillator Feedback. See the Typical Application Circuit. |
| 46 | XTALP | Crystal Oscillator Feedback. See the Typical Application Circuit. |
| 47 | ADDR1 | 2-Wire Serial-Interface Address Line 1. This pin along with ADDR2 sets the device address for the <br> I2C-compatible serial interface. |
| 48 | ADDR2 | 2-Wire Serial-Interface Address Line 2. This pin along with ADDR1 sets the device address for the <br> I2C-compatible serial interface. |
| - | EP | Exposed Paddle. Internally connected to GND. Solder evenly to the PCB ground plane for proper <br> operation. |

## Complete Single-Conversion Television Tuner

## Detailed Description

## Register Descriptions

The MAX3542 includes 11 programmable registers and two read-only registers. The 11 programmable registers include two N -divider registers, an R-divider register, a VCO register, an IFOVLD/Charge Pump/Filter Select register, a Control register, a Shutdown register, and

Tracking Filter Control registers. These 11 programmable registers are also readable. The read-only registers include a Status register and a ROM Table Data register. Recommended default bit settings are provided for user convenience only and are not guaranteed. The user must write all registers after power-up and no earlier than $100 \mu \mathrm{~s}$ after power-up.

Table 1. Register Configuration

| REGISTER <br> NAME | READ/ WRITE | REGISTER ADDRESS | MSB |  |  |  |  |  |  | LSB |

## Complete Single-Conversion Television Tuner

## 2-Wire Serial Interface

The MAX3542 uses a 2 -wire $1^{2} \mathrm{C}$-compatible serial interface consisting of a serial-data line (SDA) and a serialclock line (SCL). SDA and SCL facilitate bidirectional communication between the MAX3542 and the master at clock frequencies up to 400 kHz . The master initiates a data transfer on the bus and generates the SCL signal to permit data transfer. The MAX3542 behaves as a slave device that transfers and receives data to and from the master. Pull SDA and SCL high with external pullup resistors ( $1 \mathrm{k} \Omega$ or greater) for proper bus operation.
One bit is transferred during each SCL clock cycle. A minimum of nine clock cycles is required to transfer a byte in or out of the MAX3542 (8 data bits and an ACK/NACK). The data on SDA must remain stable during the high period of the SCL clock pulse. Changes in SDA while SCL is high and stable are considered control signals (see the START and STOP Conditions section). Both SDA and SCL remain high when the bus is not busy.

## START and STOP Conditions

The master initiates a transmission with a START condition (S), which is a high-to-low transition on SDA while SCL is high. The master terminates a transmission with a STOP condition (P), which is a low-to-high transition on SDA while SCL is high.

## Acknowledge and Not-Acknowledge Conditions

Data transfers are framed with an acknowledge bit (ACK) or a not-acknowledge bit (NACK). Both the master and the MAX3542 (slave) generate acknowledge bits. To generate an acknowledge, the receiving device must pull SDA low before the rising edge of the acknowledge-related clock pulse (ninth pulse) and keep it low during the high period of the clock pulse.

To generate a not-acknowledge condition, the receiver allows SDA to be pulled high before the rising edge of the acknowledge-related clock pulse, and leaves SDA high during the high period of the clock pulse. Monitoring the acknowledge bits allows for detection of unsuccessful data transfers. An unsuccessful data transfer happens if a receiving device is busy or if a system fault has occurred. In the event of an unsuccessful data transfer, the bus master must reattempt communication at a later time.

## Slave Address

The MAX3542 has a 7-bit slave address that must be sent to the device following a START condition to initiate communication. The slave address is determined by the state of the ADDR2 and ADDR1 pins and is equal to 11000[ADDR2][ADDR1]. The 8th bit (R/W) following the 7 -bit address determines whether a read or write operation occurs. Table 15 shows the possible address configurations.
The MAX3542 continuously awaits a START condition followed by its slave address. When the device recognizes its slave address, it acknowledges by pulling the SDA line low for one clock period; it is ready to accept or send data depending on the R/W bit (Figure 1).

Table 15. MAX3542 Address Configurations

| ADDR2 | ADDR1 | WRITE ADDRESS | READ ADDRESS |
| :---: | :---: | :---: | :---: |
| 0 | 0 | $0 \times \mathrm{C} 0$ | $0 \times \mathrm{C} 1$ |
| 0 | 1 | $0 \times \mathrm{C} 2$ | $0 \times \mathrm{C} 3$ |
| 1 | 0 | $0 \times \mathrm{C} 4$ | $0 \times \mathrm{C} 5$ |
| 1 | 1 | $0 \times \mathrm{C} 6$ | $0 \times \mathrm{C} 7$ |

Figure 1. MAX3542 Slave Address Byte

## Complete Single-Conversion Television Tuner

## Write Cycle

When addressed with a write command, the MAX3542 allows the master to write to a single register or to multiple successive registers.
A write cycle begins with the bus master issuing a START condition followed by the seven slave address bits and a write bit $(R / \bar{W}=0)$. The MAX3542 issues an ACK if the slave address byte is successfully received. The bus master must then send to the slave the address of the first register it wishes to write to. If the slave acknowledges the address, the master can then write one byte to the register at the specified address. Data is written beginning with the most significant bit. The MAX3542 again issues an ACK if the data is successfully written to the register. The master can continue to write data to the successive internal registers with the MAX3542 acknowledging each successful transfer, or it can terminate transmission by issuing a STOP condition. The write cycle does not terminate until the master issues a STOP condition.
Figure 2 illustrates an example in which registers 0 through 2 are written with $0 x 0 E, 0 x D 8$, and $0 x E 1$, respectively.

## Read Cycle

A read cycle begins with the bus master issuing a START condition followed by the seven slave address bits and a write bit $(R / \bar{W}=0)$. The MAX3542 issues an ACK if the slave address byte is successfully received. The master then sends the 8-bit address of the first register that it wishes to read. The MAX3542 then issues another ACK. Next, the master must issue a START condition followed by the seven slave address bits and a read bit $(\mathrm{R} / \overline{\mathrm{W}}=1)$. The MAX3542 issues an ACK if it successfully recognizes its address and begins sending data from the specified register address starting with the most significant bit (MSB). Data is clocked out of the MAX3542 on the rising edge of SCL. On the 9th rising edge of SCL, the master can issue an ACK and continue reading successive registers or it can issue a NACK followed by a STOP condition to terminate transmission. The read cycle does not terminate until the master issues a STOP condition. Figure 3 illustrates an example in which registers 0 and 1 are read back.

| START | WRITE DEVICE ADDRESS | R/W | ACK | WRITE REGISTER ADDRESS | ACK | $\begin{aligned} & \hline \text { WRITE DATA TO } \\ & \text { REGISTER } 0 \times 00 \\ & \hline \end{aligned}$ | ACK | $\begin{aligned} & \text { WRITE DATA TO } \\ & \text { REGISTER } 0 \times 01 \\ & \hline \end{aligned}$ | ACK | WRITE DATA TO REGISTER $0 \times 02$ | ACK | STOP |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

## Complete Single-Conversion Television Tuner

## Applications Information

## RF Inputs

The MAX3542 features separate UHF and VHF inputs that are matched to $75 \Omega$. Both inputs require a DCblocking capacitor. The active inputs are selected by the input registers. In addition, the input registers enable or disable the lowpass filter, which can be used when the VHF input is selected. For 47 MHz to 100 MHz , select the VHF_IN with the LPF filter enabled (INPT = 00 ). For 100 MHz to 326 MHz , select VHF _IN with LPF disabled (INPT $=01$ ). For 326 MHz to 862 MHz , select UHF_IN (INPT = 10).
The separate VHF and UHF inputs can be driven from a single RF source using a diplex filter. For diplex filter schematic and component values, refer to the MAX3542 Evaluation Kit data sheet.

## RF Gain Control

The gain of the RF LNA can be adjusted over a typical range of 45 dB with the RFAGC pin. The RFAGC input accepts a DC voltage from 0.5 V to 3 V , with 3 V providing maximum gain. This pin can be controlled with the IF power-detector output to form a closed RF gain-control loop. See the Closed-Loop RF Gain Control section for more information.

## RF Tracking Filter

The MAX3542 includes a programmable tracking filter for each band of operation to optimize rejection of out-of-band interference while minimizing insertion
loss for the desired received signal. The center frequency of each tracking filter is selected by a switched-capacitor array that is programmed by the TFS[7:0] bits in the Tracking Filter Series Capacitor register and the TFP[5:0] bits in the Tracking Filter Parallel Capacitor register.
Optimal tracking filter settings for each channel vary from part to part due to process variations. To accommodate part-to-part variations, each part is factory calibrated by Maxim. During calibration, the y-intercept and slope for the series and parallel tracking capacitor arrays are calculated and written into an internal ROM table. The user must read the ROM table upon powerup and store the data in local memory (8 bytes total) to calculate the optimal TFS[7:0] and TFP[5:0] settings for each channel. Table 16 shows the address and bits for each ROM table entry. See the Interpolating Tracking Filter Coefficients section for more information on how to calculate the required values.

Reading the ROM Table
Each ROM table entry must be read using a two-step process. First, the address of the ROM bits to be read must be programmed into the TFA[3:0] bits in the Tracking Filter ROM Address register (Table 11).
Once the address has been programmed, the data stored in that address is transferred to the TFR[7:0] bits in the ROM Table Data Readback register (Table 13). The ROM data at the specified address can then be read from the TFR[7:0] bits and stored in the microprocessor's local memory.

Table 16. ROM Table

# Complete Single－Conversion Television Tuner 

## Interpolating Tracking Filter Coefficients

The TFS［7：0］and TFP［5：0］bits must be reprogrammed for each channel frequency to optimize performance． The optimal settings for each channel can be calculat－ ed from the ROM table data using the equations below：
Analog（PAL）Channels：
VHF＿LO Filter：

$$
\begin{aligned}
& \text { TFS }=\operatorname{INT}\left[10^{\left[\left(1.1 \times \frac{\mathrm{LSO}}{64}+2.2\right)+\left(4 \times \frac{\mathrm{LS} 1}{16}-12\right) \times \mathrm{f}_{\mathrm{RF}} \times 10^{-3}\right]}\right]-10 \\
& \text { TFP }=\text { INT }\left[10^{\left[\left(0.8 \times \frac{\mathrm{LPO}}{64}+1.6\right)+\left(8 \times \frac{\mathrm{LP} 1}{16}-14\right) \times \mathrm{f}_{\mathrm{RF}} \times 10^{-3}\right]}\right] \\
& \text { VHF_HI Filter: }
\end{aligned}
$$

$$
\begin{aligned}
& \text { TFS }=\operatorname{INT}\left[10^{\left[\left(1.3 \times \frac{\mathrm{HSO}}{64}+2.5\right)+\left(4 \times \frac{\mathrm{HS} 1}{16}-8\right) \times \mathrm{f}_{\mathrm{RF}} \times 10^{-3}\right]}\right]-10 \\
& \mathrm{TFP}=\operatorname{INT}\left[10^{\left[\left(0.8 \times \frac{\mathrm{HPO}}{64}+1.6\right)+\left(1.6 \times \frac{\mathrm{HP} 1}{16}-3.2\right) \times \mathrm{f}_{\mathrm{RF}} \times 10^{-3}\right]}\right]
\end{aligned}
$$

UHF Filter：

$$
\begin{aligned}
& \text { TFS }=\operatorname{INT}\left[10^{\left[\left(\frac{U S O}{64}+3\right)+\left(2 \times \frac{U S 1}{64}-3\right) \times f_{R F} \times 10^{-3}\right]}\right]-20 \\
& \operatorname{TFP}=\operatorname{INT}\left[10^{\left[\left(0.8 \times \frac{U P 0}{64}+1.6\right)+\left(2 \times \frac{U P 1}{64}-2.5\right) \times f_{R F} \times 10^{-3}\right]}\right]-10
\end{aligned}
$$

where：
$\mathrm{f}_{\mathrm{RF}}=$ operating frequency in megahertz．
TFS＝decimal value of the optimal TFS［7：0］setting （Table 9）for the given operating frequency．
TFP $=$ decimal value of the optimal TFP［5：0］setting （Table 10）for the given operating frequency．
LS0，LS1，LP0，LP1，HS0，HS1，HP0，HP1，US0， US1，UPO，and UP1＝the decimal values of the ROM table coefficients（Table 16）．
Digital（DVB－T）channels：
Consult the factory for DVB－T coefficients．

## IF Overload Detector

The MAX3542 includes a broadband IF overload detec－ tor，which provides an indication of the total power pre－ sent at the RF input．The overload－detector output voltage is compared to a reference voltage，and the difference is amplified．This error signal drives an open－collector tran－ sistor whose collector is connected to the IFOVLD pin， causing the IFOVLD pin to sink current．The nominal full－ scale current sunk by the IFOVLD pin is $300 \mu \mathrm{~A}$ ．The IFOVLD pin requires a $10 k \Omega$ pullup resistor to VCC．
The IF overload detector is calibrated at the factory to attack at $0.7 \mathrm{VP}-\mathrm{P}$ at the IFOUT1．Upon power－up，the baseband processor must read OD［2：0］from the ROM table and store it in the IFOVLD register．

Closed－Loop RF Gain Control
Closed－loop RF gain control can be implemented by connecting the IFOVLD output to the RFAGC input． Using a $10 \mathrm{k} \Omega$ pullup resistor on the IFOVLD pin as shown in the Typical Application Circuit results in a nominal control voltage range of 0.5 V to 3 V ．

## VCO and VCO Divider Selection

The MAX3542 frequency synthesizer includes three VCOs and eight VCO sub－bands to guarantee a 2200 MHz to 4400 MHz VCO frequency range．The fre－ quency synthesizer also features an additional VCO frequency divider that must be programmed to either 4， 8 ，16，or 32 by the VDIV［1：0］bits in the VCO register based on the channel being received．
To ensure PLL lock，the proper VCO and VCO sub－ band for the channel being received must be chosen by iteratively selecting a VCO and VCO sub－band，then reading the $L D[2: 0]$ bits to determine if the PLL is locked．Any reading from 001 to 110 indicates the PLL is locked．If $L D[2: 0]$ reads 000 ，the PLL is unlocked and the selected VCO is at the bottom of its tuning range；a lower VCO sub－band must be selected．If LD［2：0］reads 111，the PLL is unlocked and the selected VCO is at the top of its tuning range；a higher VCO sub－band must be selected．The VCO and VCO sub－band settings should be progressively increased or decreased until the $\operatorname{LD}[2: 0]$ reading falls in the 001 to 110 range．
Due to overlap between VCO sub－band frequencies， it is possible that multiple VCO settings can be used to tune to the same channel frequency．System per－ formance at a given channel should be similar between the various possible VCO settings，so it is sufficient to select the first VCO and VCO sub－band that provides lock．

## Layout Considerations

The MAX3542 EV kit can serve as a guide for PCB lay－ out．Keep RF signal lines as short as possible to mini－ mize losses and radiation．Use controlled impedance on all high－frequency traces．The exposed paddle must be soldered evenly to the board＇s ground plane for proper operation．Use abundant vias beneath the exposed pad－ dle for maximum heat dissipation．Use abundant ground vias between RF traces to minimize undesired coupling．
To minimize coupling between different sections of the IC，the ideal power－supply layout is a star configuration， which has a large decoupling capacitor at the central VCC node．The VCC traces branch out from this node， with each trace going to separate VCC pins of the MAX3542．Each Vcc pin must have a bypass capacitor with a low impedance to ground at the frequency of interest．Do not share ground vias among multiple con－ nections to the PCB ground plane．
