MAXIM

825MHz to 915MHz, SiGe High-Linearity Active Mixer

MAX9982

General Description

The MAX9982 fully integrated SiGe mixer is optimized to meet the demanding requirements of GSM850, GSM900, and CDMA850 base-station receivers. Each high-linearity device includes a local oscillator (LO) switch, LO driver, and active mixer. On-chip baluns are also integrated to allow for single-ended RF and LO inputs. Since the active mixer provides 2dB of conversion gain, the device effectively replaces the IF amplifier stage, which typically follows most passive mixer implementations.

The MAX9982 provides exceptional linearity with an input IP3 of greater than +26dBm. The integrated LO driver allows for a wide range of LO drive levels from -5dBm to +5dBm. In addition, the built-in switch enables rapid LO selection of less than 250ns, as needed for GSM frequency-hopping applications.

The MAX9982 is available in a 20-pin QFN package (5mm × 5mm) with an exposed paddle and is specified over the -40°C to +85°C extended temperature range.

Applications

GSM850/GSM900 2G and 2.5G EDGE Base Station Receivers

Cellular cdmaOne™ and cdma2000™ Base Station Receivers

TDMA and Integrated Digital Enhanced Network (iDEN)™ Base Station Receivers

Digital and Spread-Spectrum Communication Systems

Microwave Links

Typical Application Circuit appears at end of data sheet.

cdmaOne is a trademark of CDMA Development Group.

cdma2000 is a trademark of Telecommunications Industry Association.

*iDEN is a trademark of Motorola, Inc.*

Features

♦ **+26.8dBm Input IP3**

♦ **+13dBm Input 1dB Compression Point**

♦ **825MHz to 915MHz RF Frequency Range**

♦ **70MHz to 170MHz IF Frequency Range**

♦ **725MHz to 1085MHz LO Frequency Range**

♦ **2dB Conversion Gain**

♦ **12dB Noise Figure**

♦ **-5dBm to +5dBm LO Drive**

♦ **5V Single-Supply Operation**

♦ **Built-In LO Switch**

♦ **ESD Protection**

♦ **Internal RF and LO Baluns for Single-Ended Inputs**

Ordering Information

Detailed Description

The MAX9982 downconverter mixer is designed for GSM and CDMA base station receivers with an RF frequency between 825MHz and 915MHz. It implements an active mixer that provides 2dB of overall conversion gain to the receive path, removing the need for an additional IF amplifier. The mixer has excellent input IP3 measuring +26.8dBm. The device also features integrated RF and LO baluns that allow the mixers to be driven with single-ended signals.

RF Inputs

The MAX9982 has one input (RF) that is internally matched to 50Ω requiring no external matching components. A 33pF DC-blocking capacitor is required at the input since the input is internally DC shorted to ground through a balun. The input frequency range is 825MHz to 915MHz.

LO Inputs

The mixer can be used for either high-side or low-side injection applications with an LO frequency range of

/VI/IXI/VI

725MHz to 1085MHz. An internal LO switch allows for switching between two single-ended LO ports; this is useful for fast frequency changes/frequency hopping. LO switching time is typically less than 250ns. The switch is controlled by a digital input (LOSEL) that when high, selects LO1 and when low, selects LO2.

Internal LO buffers allow for a wide power range on the LO ports. The LO signal power can vary from -5dBm to +5dBm. LO1 and LO2 are internally matched to 50Ω, so only a 33pF DC-blocking capacitor is required at each LO port.

IF Outputs

This mixer has an IF frequency range of 70MHz to 170MHz. The differential IF output ports require external pullup inductors to V_{CC} to resonate out the differential on-chip capacitance of 1.8pF. See the *Typical Application Circuit* for recommended component values for an IF optimized for 70MHz to 100MHz. Higher IF frequencies can be optimized by reducing the values of L1 and L2.

Removing the ground plane from underneath L1 and L2 reduces parasitic capacitive loading and improves VSWR.

Bias Circuitry

Connect a bias resistor from RFBIAS to ground to set the mixer bias current. A nominal resistor value of 249Ω sets an input IP3 of +26.8dBm and supply current of 168mA.

Applications Information

Layout Considerations

A properly designed PC board is an essential part of any RF/microwave circuit. Keep RF signal lines as short as possible to reduce losses, radiation, and inductance. For best performance, route the ground pin traces directly to the exposed paddle underneath the package. Solder the exposed pad on the bottom of the device package evenly to the board ground plane to provide a heat transfer path along with RF grounding. If the PC board ground plane is not immediately available on the top metal layer, provide multiple vias between the exposed paddle connection and the PC board ground plane.

Power-Supply Bypassing

Proper voltage supply bypassing is essential for high-frequency circuit stability. Bypass each V_{CC} pin with a 0.1µF capacitor. Bypass TAP by placing a 33pF (C2) to ground within 100 mils of the TAP pin.
