### Description

A compact universal input voltage 60W constant voltage/ constant current switching power module suitable for driving high power LEDs. The LED drivers have a dual mode of operation: CV mode: at loads below the preset current limit, the RACD60 behaves as a voltage source. CC mode: at loads above the preset current limit, the RACD60 behaves as a current source. Thus the same power supply can be used with both CV and CC LED modules. The current limit can be set by the user. The RACD 60 series have a universal input voltage range and are fully protected against output short circuit, overload and over-temperature. The converters feature built-in power factor correction as standard.

### Application Information

LEDs are typically wired in series to make a string of LEDs and then the strings can be wired in parallel to generate enough light. If only two or three strings are wired in parallel then it is recommended to add resistors (e.g. 0.5R) to each string to help balance out the LED currents in each string. All strings must share a common heatsink for better current matching.

A typical 1W high brightness white LED has a forward voltage of around 3.3V at its operating temperature and draws 350mA. Thus each LED actually draws about 1.15W. Similarly, 3W white LEDs have usually the same forward voltage but can be run at 700mA or more. Using the LED datasheet specification, the optimum LED arrangement and the best driver for each application can be worked out.

The tables below show some examples. Other LED combinations may have different forward voltages at their recommended operating currents.
