

Description

The PSS/PSK Series of positive switching regulators is designed as power supplies for electronic systems, where no input-to-output isolation is required. Their major advantages include a high level of efficiency, high reliability, low output ripple, and excellent dynamic response. Models with input voltages up to 144 V are specially designed for secondary switched and battery-driven mobile applications. The converters are suitable for railway applications according to EN 50155 and EN 50121.

Two type of housings are available allowing operation up to 71 °C. They are designed for insertion into a 19" DIN-rack or for chassis mounting. Replacing the heat sink by an optional cooling plate, allows chassis or wall mounting on top of a metal surface, acting as heat sink.

Various options are available to adapt the converter to different applications. Connector type: H15 or H15S4, depending on output current.

Features

- Input voltage up to 144 VDC
- Single output of 3.3 to 48 VDC
- No input-to-output isolation
- High efficiency up to 97%
- Extremely wide input voltage range
- Low input-to-output differential voltage
- Very good dynamic properties
- Input undervoltage lockout
- Active current sharing for parallel operation
- Output voltage adjustment, inhibit, and sense lines
- Continuously no-load and short-circuit proof
- All boards are coated with a protective lacquer

⁴ Not available for PSK3E25

Note: Non-standard input/output configurations or special custom adaptations are available on request.

Part Number Description

Positive switching regulator in case S01, K01	PSS, PSK	PSK 12 12 -7 E P C B G
Nominal output voltage in volt	3.3 – 48	
Nominal output current in ampere	9 – 25	
Operational ambient temperature range T_A		
-10 to 50 °C	-2	
-25 to 71 °C	-7	
-40 to 71 °C (optional)	-9	
Options:		
Inrush current limitation	E	
Potentiometer to adjust V_o ¹	P	
Thyristor crowbar	C	
Cooling plate large/small	B, B1	
RoHS-compliant for all 6 substances	G ²	

¹ Option P excludes R-features and vice versa.

² G is always placed at the end of the part number. Consult Power-One for availability!

Example: PSS 129-7EPCB = Positive switching regulator with output 12 V, 9 A, ambient temperature range of -25 to 71 °C, inrush current limitation, potentiometer, crowbar, and large cooling plate option B.

Product Marking

Type designation, applicable safety approvals and recognition marks, warnings, pin allocation, Power-One patents and company logo.

Identification of LED, test sockets, and optional potentiometer.

Input voltage range, nominal output voltage and current, protection degree, batch no., serial no., and data code including production site, version (modificationstatus), and date of production.

Functional Description

The switching regulators are using the buck converter topology. The input is not electrically isolated from the output. During the on period of the switching FET, current is transferred to the output, and energy is stored in the output choke. During the off period, this energy forces the current to continue flowing through the output chocke to the load and

back through the freewheeling diode. Regulation is accomplished by varying on/off duty cycle.

These regulators are ideal for applications, where an input to output isolation is not necessary or where it is already provided by an external front end, e.g., a transformer with rectifier. To optimize customer's needs, various options and accessories are available.

Input Filter and Fuse

An input filter and a fuse are incorporated in all converters as standard. The filter reduces emitted electrical noise and prevents oscillations caused by the negative input impedance

Table 3: Input fuses

Model	Fuse type	Size	Supplier
PSK3E25, PSK5A20, PSK5A25 PSK1220, PSK2420, PSK3620	F 25 A	6.3 × 32 mm	Littlefuse
PSK5A16, PSK1216, PSK1218 PSK2416, PSK2418, PSK3620	F 20 A		
PSS5A12, PSS5A14, PSS1212, PSK1212, PSS1214 PSS2412, PSK2412, PSS2414 PSS3612, PSK3612, PSK3616 PSK4812	F 15 A		
PSS129, PSS249 PSS369, PSS489	F 10 A		

characteristic of a switched mode regulator. The input fuse protects against severe defects.

The maximum permissible additionally superimposed ripple v_i of the input voltage (rectifier mode) at a specified input frequency f_i has the following values:

$$V_{i\text{ max}} = 10 V_{pp} \text{ at } 100 \text{ Hz, or } V_{pp} = 1000 \text{ Hz}/f_i \cdot 1 \text{ V}$$

The input fuses are specified in the table 3.

Inrush Current

Depending on the input source and the input impedance, the inrush current into the converter may reach a very high peak value during the switch-on sequence. It also determine the rating of input devices such as switches, relays, fuses, etc. To protect these input devices by limiting the inrush current, we recommend the choice of the active inrush current limitation circuit, option E.

Electrical Output Data

General Conditions:

- $T_A = 25^\circ\text{C}$, unless T_C is specified
- R control (pin 16) not connected or programmed to $V_{O\text{ nom}}$ at $I_{O\text{ nom}}$
- Inhibit input (pin 14) connected to Go-
- Sense lines S+ and S- connected at female connector

Output Voltage Regulation

The dynamic load regulation is shown in fig. 2

Fig. 2
Dynamic load regulation.

Output Protection

A voltage suppressor diode, which in worst case conditions fails into a short-circuit, protects the output against an internally generated overvoltage. Such an overvoltage could occur due to a failure of either the control circuit or the switching transistor. The output protection is not designed to withstand externally applied overvoltages.

Current Limitation

A constant current limitation circuit holds the output current I_o almost constant in the area of 100 to 120% of $I_{o\text{ nom}}$, when an overload or a short-circuit is applied to the output. It acts self-protecting and recovers – in contrary to the fold back method – automatically after removal of the overload or short-circuit condition.

Fig. 3
Overload, short-circuit behaviour V_o versus I_o .

Parallel and Series Connection

Outputs of equal nominal voltage may be parallel-connected. Interconnect the current sharing pins T (pin 22) for even distribution of the output current; see *Auxiliary Functions*.

Outputs can be series-connected with any other regulator, provided that the regulators are powered by electrically isolated source voltages. In series connection the maximum output current is limited by the lowest current limitation.

Thermal Considerations and Protection

When a switching regulator is located in free, quasi-stationary air (convection cooling) at a temperature $T_{A \max}$ and is operated at its nominal output current $I_{o \text{ nom}}$, the case temperature T_C can rise over $T_{C \max}$ after the warm-up phase. T_C is measured at the measuring point of case temperature; see *Mechanical Data*.

Under practical operating conditions, the ambient temperature T_A may exceed $T_{A \max}$, provided that additional measures (heat

Fig. 4a
Output current derating versus temperature (models -2)

sink, forced cooling, etc.) are taken to ensure that the case temperature T_C does not exceed its maximum value.

The regulator is protected by an internal temperature sensor, which inhibits the output above $T_{C \max}$. The output automatically recovers, when the temperature drops below $T_{C \max}$.

Fig. 4b
Output current derating versus temperature (models -7 or -9).

Auxiliary Functions

Inhibit (Remote On / Off)

The inhibit input allows to enable or disable the output with a control signal. In systems with several regulations, this feature can be used to control the activation sequence of the regulators by a logic signal (TTL, C-MOS, etc.). An output voltage overshoot will not occur, when switching on or off.

The inhibit signal is referenced to the S- (pin 18). The signal i and the switching times are specified in table 5, fig. 5, and fig. 6.

Note: With open i input, the output is enabled.

Table 5: Inhibit characteristics

Characteristics		Conditions	min	typ	max	Unit
V_{inh}	Inhibit input voltage	$V_o = \text{on}$	$V_{i \text{ min}} - V_{i \text{ max}}$	-50	+0.8	V
		$V_o = \text{off}$	$T_{C \text{ min}} - T_{C \text{ max}}$	+2.4	+50	
t_r	Switch-on time	$V_i = V_{i \text{ nom}}$		130		ms
t_f	Switch-off time	$R_L = V_o \text{ nom} / I_o \text{ nom}$		25		
$I_{i \text{ inh}}$	Input current when inhibited	$V_i = V_{i \text{ nom}}$		25		mA

Fig. 5
Specification of the inhibit signal (typical)

Fig. 6
Output response as a function of the inhibit signal

Sense Lines

This feature enables compensation of the voltage drop across the connector contacts and the load lines. If the sense lines are connected at the load rather than directly at the connector, the user must ensure that $V_{o\ max}$ (between Vo+ and Go-) is not exceeded.

Applying generously dimensioned cross-section load leads reduces the voltage drop. To minimize noise pick-up, the sense lines should be wired in parallel or twisted.

To ensure correct operation, both sense lines must be connected to their respective power output. The voltage difference between any sense line and its respective power output pin (as measured on the connector) should not exceed the values given in table 4.

Note: Sense lines should always be connected! It is recommended to connect the sense lines directly at the female connector.

Table 6: Allowed voltage compensation using sense lines

Nominal output voltage	Total voltage difference between both sense lines and their respective output	Voltage difference between Go- and S-
3.3 V, 5.1 V	≤ 0.5 V	≤ 0.25 V
12 – 48 V	≤ 1.0 V	≤ 0.25 V

Fig. 7
Sense lines connection

Current Sharing

For parallel operation of several regulators, interconnect all T-pins to ensure that the output currents are evenly distributed. This feature improves transient load performance and increases system reliability. All paralleled regulators should be supplied by equal input voltage (V_i). The output lines should exhibit equal length and cross section to provide equal voltage drop.

Table 7: Maximum adjustable output voltage

$V_{o\ nom}$	Nominal Output Volt.	Conditions	3.3 V min typ	5.1 V min typ	12/15 V min typ	24 V min typ	36 V min typ	48 V min typ	Unit
$V_{o\ max}$	Maximum adjustable output voltage with R-input	$V_{i\ nom}, I_{o\ nom}$??	5.6	16	26	42.5	52.8	V

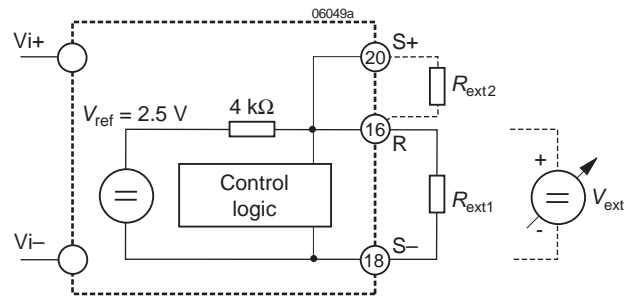

Fig. 8
Voltage adjustment via R-input

R Control (Output Voltage Adjust)

Note: With open R input, $V_o \approx V_{o\ nom}$.

The output voltage V_o can either be adjusted with an external voltage source (V_{ext}) or with an external resistor (R_1 or R_2). The adjustment range is 0 – $V_{o\ max}$. The minimum differential voltage $\Delta V_{i\ min}$ between input and output (see *Electrical Input Data*) should be maintained.

a) $V_o = 0 - V_{o\ max}$, using V_{ext} between R and S-:

$$V_{ext} \approx 2.5\text{ V} \cdot \frac{V_o}{V_{o\ nom}} \quad V_o \approx V_{o\ nom} \cdot \frac{V_{ext}}{2.5\text{ V}}$$

Caution: To prevent damage V_{ext} should not exceed 20 V, nor be negative.

b) $V_o = 0$ to $V_{o\ nom}$, using R_1 between R and S-:

$$R_1 \approx \frac{4000\ \Omega \cdot V_o}{V_{o\ nom} - V_o} \quad V_o \approx \frac{V_{o\ nom} \cdot R_1}{R_1 + 4000\ \Omega}$$

c) $V_o = V_{o\ nom}$ to $V_{o\ max}$, using R_2 between R and S+:

$$R_2 \approx \frac{4000\ \Omega \cdot V_o \cdot (V_{o\ nom} - 2.5\text{ V})}{2.5\text{ V} \cdot (V_o - V_{o\ nom})}$$

$$V_o \approx \frac{V_{o\ nom} \cdot 2.5\text{ V} \cdot R_2}{2.5\text{ V} \cdot (R_2 + 4000\ \Omega) - V_{o\ nom} \cdot 4000\ \Omega}$$

Caution: To prevent damage, R_2 should never be less than 47 kΩ.

Test Sockets

Test sockets (pin $\varnothing = 2\text{ mm}$) for measuring the output voltage V_o at the sense lines, are located at the front side of the regulator. The test sockets are protected by a series resistor.

LED Output Voltage Indicator

A green indicator LED illuminates, when the output voltage is present.

Electromagnetic Compatibility (EMC)

Electromagnetic Immunity

General condition: Case not earthed.

Table 8: Immunity type tests

Mechanical Data

PSS Models

The regulators are designed to be inserted into a rack according to IEC 60297-3. Dimensions in mm.

Fig. 10
Case S01 for PSS models; weight 1.3 kg
Aluminium, fully enclosed, black finish EP power-coated, and self cooling.

Notes:

- $d \geq 15$ mm, recommended minimum distance to next part to ensure proper air circulation at full output power.
- Free air locations: the regulator should be mounted with its fins in vertical position to achieve a maximum air flow through heat sink.

PSK Models

The regulators are designed to be inserted into a rack according to IEC 60297-3. Dimensions in mm.

Fig. 11
Case K01 for PSK models, weight 1.6 kg
Aluminium, fully enclosed, black finish EP power-coated, and self cooling.

Notes:

- $d \geq 15$ mm, recommended minimum distance to next part to ensure proper air circulation at full output power.
- Free air locations: the regulator should be mounted with its fins in vertical position to achieve a maximum air flow through heat sink.

Safety and Installation Instructions

Connector Pin Allocation

The connector pin allocation table defines the electrical potentials and the physical pin positions on the H15 or H15S4 connector. Pin 24 (protective earth) is a leading pin, which provides electrical contact first. The regulators should only be wired via the female connector H15 (according to DIN 41612) to ensure requested safety!

Fig. 12
View of H15 and H15S4 male connector

Table 12: H15 and H15S4 connector pin allocation

Electrical Determination	Type H15		Type H15S4	
	Pin no.	Ident.	Pin no.	Ident.

¹ Not available with option P

Installation Instruction

Installation of the regulators must strictly follow the national safety regulations in compliance with the enclosure, mounting, creepage, clearance, casualty, markings, and segregation requirements of the end-use application.

The input and the output circuit are not separated. The negative path is internally interconnected.

The regulators should be connected to a secondary circuit. Make sure that a regulator failure (e.g. by an internal short-circuit) does not result in a hazardous condition.

Do not open the regulator!

Standards and Approvals

All switching regulators are class-I equipments and have been approved according to UL 60950, CSA 60950, and IEC/EN 60950.

The regulators have been evaluated for:

- Building in
- Operational insulation from input to output and input/output to case
- The use in a pollution degree 2 environment
- Connecting the input to a secondary circuit, which is subject to a maximum transient rating of 1500 V.

The switching regulators are subject to manufacturing surveillance in accordance with the above mentioned standards and with ISO 9001:2000.

Cleaning Agents

In order to avoid possible damage, any penetration of cleaning fluids must be prevented, since the regulators are not hermetically sealed.

Protection Degree

The protection degree is IP 30 (IP 20, if equipped with option P). It applies only, if the regulator is plugged-in or the matching female connector is properly attached.

Isolation and Protective Earth

The resistance of the protective earth connection (max. 0.1 Ω) is tested. Also the electric strength between the input interconnected with the output and the case is tested with 500 VDC (all -2 models), 750 VDC (models with $V_{i\max} = 80$ V), or 1500 VDC (models with $V_{i\max} = 144$), ≥ 1 s.

These tests are performed in the factory as routine test in accordance with EN 50116 and IEC/EN 60950. The electric strength test should not be repeated by the customer. Power-One will not honor any warranty claims resulting from electric strength tests.

Railway Application

The regulators have been developed observing the railway standards EN 50155 and EN 50121. All boards are coated with a protective lacquer.

Description of Options

-9 Extended Temperature Range

This option defines an extended temperature range as specified in table 10.

P Potentiometer to Adjust the Output

Note: Option P is not recommended, if several regulators are operated in parallel connection.

Option P excludes R function; the R-input (pin 16) should be left open-circuit. The output voltage V_o can be adjusted in the range 90 - 110% of $V_{o\text{ nom}}$.

However, the minimum differential voltage $V_{i\text{ max}}$ between input and output as specified in *Electrical Input Data* should be maintained.

E Inrush Current Limitation

Note: This option requires an increased minimum input voltage $V_{i\text{ max}}$ of up to 1 V, dependent upon input range.

In regulators without option E, after application of the input supply the inrush current is limited by parasitic components of the voltage source and the regulator input only. The regulator input exhibits a very low impedance, and when driven from a low impedance source, for example a battery, the inrush current can peak at several orders of magnitude above the continuous input current.

Option E dramatically reduces this peak current and is recommended for any application to protect series elements such as fuses, switches, or circuit breakers. The startup circuit is bypassed during normal operation.

C Thyristor Crowbar

Note: The crowbar can be reset by removal of the input voltage only. The inhibit signal cannot deactivate the thyristor.

Option C protects the load against power supply malfunction. It is not designed to sink external currents.

As a central overvoltage protection device, the crowbar is usually connected to the external load via distributed inductance of the lines. For this reason, the overvoltage at the load can temporarily exceed the trigger voltage $V_{o\text{ c}}$.

Fig. 13

Option E: Inrush current versus time. R_s is the startup resistor ($R_s = 1 \Omega$ for models with $V_{i\text{ max}} \leq 80 \text{ V}$, $R_s = 15 \Omega$ for models with $V_{i\text{ max}} > 80 \text{ V}$)

Depending on the application, further decentralized overvoltage protection elements may have to be used additionally.

A fixed-value monitoring circuit checks the output voltage V_o , and when the trigger voltage $V_{o\text{ c}}$ is reached, the thyristor crowbar triggers and disables the output.

An external connection C (crowbar trigger control) is provided. When crowbar option is used with two or more power supplies in parallel connection, all crowbar trigger terminals (C) should be interconnected. This ensures all crowbar circuits triggering simultaneously, in order to disable all outputs at once. The crowbar trigger voltage is maintained between V_{o+} and V_{o-} . To prevent false triggering, the user should ensure that V_o (between V_{o+} and V_{o-}) does not exceed $V_{o\text{ c}}$.

G RoHS Compliance

Models with G are RoHS-compliant for all six substances.

Table 13: Crowbar trigger levels

¹ Models with option P

B, B1 Cooling Plate

Where a cooling surface is available, a cooling plate (option B or option B1) can be fitted instead of the standard heatsink. The mounting system must ensure sufficient cooling capacity

to guarantee that the maximum case temperature $T_{C \max}$ is not exceeded. The required cooling capacity can be calculated by the following formula:

$$P_{\text{Loss}} = \frac{100\% - \eta}{\eta} \cdot (V_o \cdot I_o)$$

Fig. 14
Option B, large cooling plate
Weight: 1.3 kg

Fig. 15
Option B1, small cooling plate
Weight: 1.2 kg

Accessories

A variety of electrical and mechanical accessories are available including:

- Various mating connectors H15 and H15S4 including fast-on, screw, solder or press-fit terminals, code key system and coding clips [HZZ00202]
- Connector retention brackets CRB [HZZ01216]
- Connector retention clips V [HZZ01209]
- Cable connector housing (cable hood) KSG-H15/H15S4 [HZZ00141], also available with fixation [HZZ00142]
- Various front panels for 19" racks with 3U height, 12 or 16 TE, Schroff or Intermas
- Wall-mounting plate K02 [HZZ01213] for models with option B1
- Brackets for DIN-rail and wall mounting [HZZ00610]
- DIN-rail mounting assembly DMB-K/S [HZZ0615]
- Additional external input and output filters
- Battery sensor [S-KSMH...] for using the converter as a battery charger. Different cell characteristics can be selected; see *Battery Charging/Temperature Sensor*

For additional accessory product information, see the accessory data sheets listed with each product series or individual model listing at www.power-one.com.

NUCLEAR AND MEDICAL APPLICATIONS - Power-One products are not designed, intended for use in, or authorized for use as critical components in life support systems, equipment used in hazardous environments, or nuclear control systems without the express written consent of the respective divisional president of Power-One, Inc.

TECHNICAL REVISIONS - The appearance of products, including safety agency certifications pictured on labels, may change depending on the date manufactured. Specifications are subject to change without notice.

EC Declaration of Conformity

We

Power-One AG
Ackerstrasse 56 CH-8610 Uster

declare under our sole responsibility that all PSx Series switching regulators carrying the CE-mark are in conformity with the provisions of the Low Voltage Directive (LVD) 2006/95/EC of the European Communities..

Conformity with the directive is presumed by conformity with the following harmonized standards:

- EN 61204: 1995 (= IEC 61204: 1993, modified)
Low-voltage power supply devices, DC output - Performance characteristics and safety requirements
- EN 60950: 1992 + A1: 1993 + A2 (= IEC 950 second edition 1991 + A1: 1992 + A2: 1993) - Safety of information technology equipment

The installation instructions given in the corresponding data sheet describe correct installation leading to the presumption of conformity of the end product with the LVD. All PSx Series Switching Regulators are components, intended exclusively for inclusion within other equipment by an industrial assembly operation or by professional installers. They must not be operated as stand alone products.

Hence conformity with the Electromagnetic Compatibility Directive 89/336/EEC (EMC Directive) needs not to be declared. Nevertheless, guidance is provided in most product application notes on how conformity of the end product with the indicated EMC standards under the responsibility of the installer can be achieved, from which conformity with the EMC directive can be presumed.
