18-Bit, 10-Port Crossbar Switch

Product Features

- Full 10-way crossbar
- Independent controls for all ports
- Multiple parts can be used for wider data paths
- Near-zero propagation delay
- 25Ω switches connect input to outputs
- Direct bus connection when switches are ON
- Ultra Low Quiescent Power (1mA Typical)
- Packages available:
  - 256-pin BGA (NA256)

Applications

- Digital network switching:
  - Hubs & Routers
  - ATM Switch Systems
  - Backbone Access Routing
  - Add Drop Multiplexing
- Multiprocessor systems switching
- Large memory bus switching
- Video signal routing & Image processing
- Telecommunications switching
- RAID systems bus switching

Truth Table

Function	Pin	State
Port N - Port M connected*	S_{N-M}	Low
Port N - Port M disconnected*	S_{N-M}	High

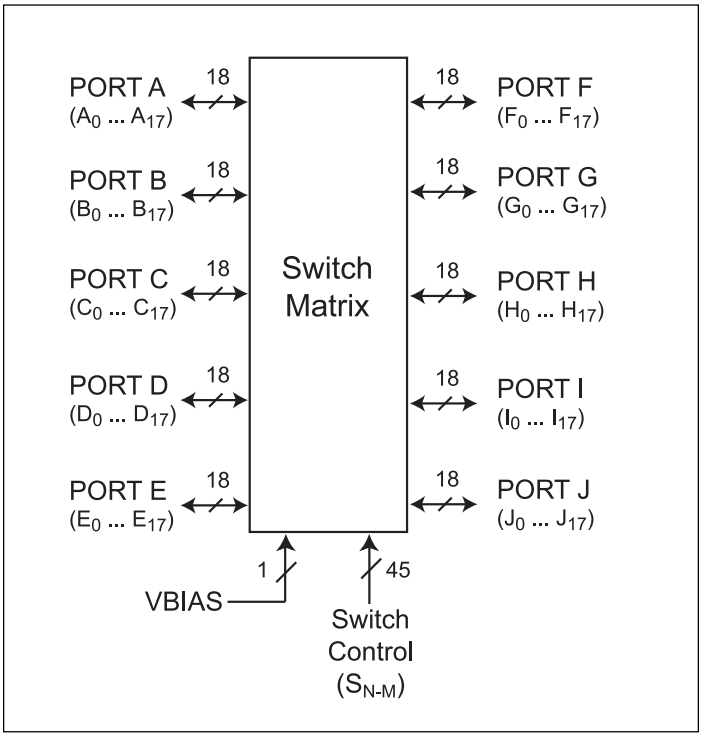
* Specify low numbered port first

Product Description

Pericom's PI5X series of high density logic circuits are produced using the Company's advanced submicron CMOS technology to achieve industry leading performance.

The PI5X1018 is an 18-bit, 10-port crossbar switch designed with a low ON resistance allowing inputs to be connected directly to outputs. The crossbar creates a low propagation delay and adds low additional ground bounce noise. Switches are turned ON in groups of 18 allowing any combination of connected ports. An additional bias voltage pin, VBIAS, permits control of internal pull-up resistors that can be used for pin termination. Several of these devices can be grouped together for wider data and control paths.

Logic Block Diagram



Product Pin Description

Pin Name	Description
A0…A17 through J0…J17	180 Pins total. Dedicated to ten 18-bit ports. Contains internal pull-up resistor controlled by pin V_{BIAS}.
S_{N-M}	45 Pins total. Dedicated to port switching. Where N is from A to I and M is from B to J and N< M. Also, contains internal pull-up resistor controlled by pin V_{BIAS}.
V_{BIAS}	Adjusts internal pull-up resistance value for all pins A-J & S_{N-M}; (default value with internal bias voltage of 2.9V is around 20kΩ). For V_{BIAS} = 0V, pull-up resistor value is less than 5kΩ. For V_{BIAS} = 4.1V, pull-up resistor value is greater than 100kΩ.
V_{DD} & V_{SS}	23 Pins dedicated to Power (VDD) and Ground (VSS)
NC	6 Pins are No Connect

PI5X1018 Pin Assignment (Top View)

Maximum Ratings

(Above which the useful life may be impaired. For user guidelines, not tested.)

Storage Temperature	–65°C to +150°C
Ambient Temperature with Power Applied	–40°C to +85°C
Supply Voltage to Ground Potential (Inputs & Vcc Only)	–0.5V to +7.0V
Supply Voltage to Ground Potential (Outputs & D/O Only)	–0.5V to +7.0V
DC Input Voltage	–0.5V to +7.0V
DC Output Current	120mA
Power Dissipation	0.5W

Note:
Stresses greater than those listed under MAXIMUM RATINGS may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect reliability.

DC Electrical Characteristics (Over the Operating Range, T_A = –40°C to +85°C, V_{CC} = 4.5V to 5.5V)

Parameters	Description	Test Conditions[1]		Min.	Typ.[2]	Max.	Units
V_{IH}	Input HIGH Voltage	Guaranteed Logic HIGH Level		2.0			V
V_{IL}	Input LOW Voltage	Guaranteed Logic LOW Level		-0.5		0.8	
I_{IH}	Input HIGH Current	V_{CC} = Max., V_{IN} = V_{CC}, V_{BIAS} = OPEN				±400	µA
I_{IL}	Input LOW Current	V_{CC} = Max., V_{IN} = GND, V_{BIAS} = OPEN				±400	
I_{OZH}	High Impedence Output Current	0 ≤ N, M ≤ V_{CC}, V_{BIAS} = OPEN				±1	
I_{OZL}	Low Impedence Output Current	V_{IN} = 0V, V_{BIAS} = OPEN				±400	
V_{IK}	Clamp Diode Voltage	V_{CC} = Min., I_{IN} = –18mA				-1.8	V
I_{OS}	Short Circuit Current[3]	N(M) = 0V, M(N) = V_{CC}		100			mA
V_H	Input Hysteresis at Control Pins				150		mV
R_{ON}	Switch On Resistance[4]	V_{CC} = Min., V_{IN} = 0.0V, I_{ON} = 48mA	Bits 0-9			20	Ω
			All other bits			25	
		V_{CC} = Min., V_{IN} = 2.4V, I_{ON} = 15mA	Bits 0-9			30	
			All other bits			40	

Capacitance (T_A = 25°C, f = 1 MHz)

Parameters[5]	Description	Test Conditions	Typ.	Units
C_{IN}	Control Input Capacitance	V_{IN} = 0V	4	pF
C_{OFF}	Port Pin Capacitance, Port Disconnected	V_{IN} = 0V	27	pF
C_{ON}	Port Pin Capacitance, Port Connected to One Other Port	V_{IN} = 0V	52	pF

Notes:

1. For Max. or Min. conditions, use appropriate value specified under Electrical Characteristics for the applicable device type.
2. Typical values are at V_{CC} = 5.0V, T_A = 25°C ambient and maximum loading.
3. Not more than one output should be shorted at one time. Duration of the test should not exceed one second.
4. Measured by the voltage drop between N and M pin at indicated current through the switch. ON resistance is determined by the lower of the voltages on the two (N,M) pins.
5. This parameter is guaranteed by design.
6. Where N is a pin of any port and M is a pin of any other port.

Power Supply Characteristics

Parameters	Description	Test Conditions[1]		Min.	Typ.[2]	Max.	Units
I_{CC}	Quiescent Power Supply Current	V_{CC} = Max.	V_{IN} = OPEN or V_{CC}			1.0	mA
ΔI_{CC}	Supply Current per Input @ TTL HIGH	V_{CC} = Max.	V_{IN} = 3.4V[3]			2.5	mA

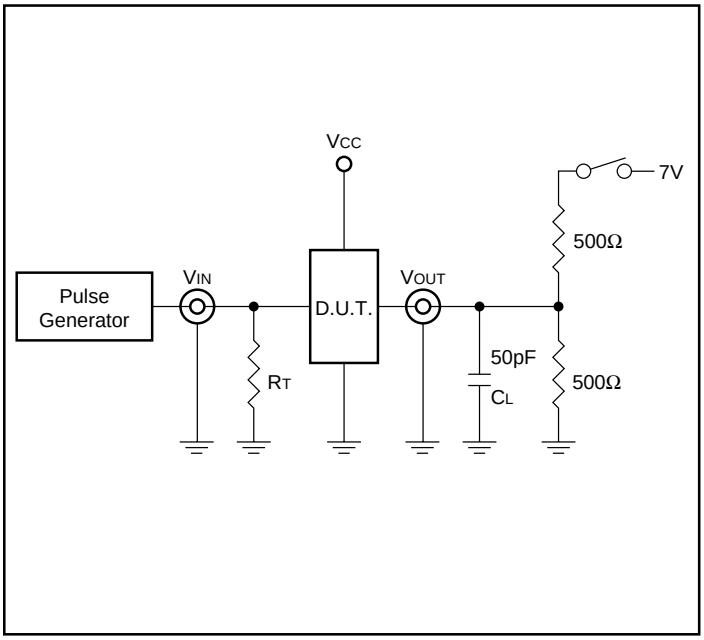
Notes:
1. For Max. or Min. conditions, use appropriate value specified under Electrical Characteristics for the applicable device.
2. Typical values are at V_{CC} = 5.0V, +25°C ambient.
3. Per TTL driven input (V_{IN} = 3.4V, control inputs only); port A - J pins do not contribute to I_{CC}.
4. This current applies to the control inputs only and represent the current required to switch internal capacitance at the specified frequency. The port A - J inputs generate no significant AC or DC currents as they transition. This parameter is not tested, but is guaranteed by design.

Switching Characteristics over Operating Range

Parameters	Description	Conditions	PI5X1018 (Com)			Units
			Min.	Typ.	Max.	
t_{PLH} t_{PHL}	Propagation Delay[2,3,4] N_0 to M_0, N_0 to M_0 N_9 to M_9, N_9 to M_9	Load = C_L = 20pF	—	1.0	1.25	ns
t_{PLH} t_{PHL}	Propagation Delay[2,3,5] N_X to M_X, N_X to M_X Bits 1 through 8 & 10 thru 17		—	—	2.0	
t_{PZH} t_{PZL}	Bus Enable Time[4,5] S_{N-M} to N_X or M_X	See Note 1	1.5	—	6.0	
t_{PHZ} t_{PLZ}	Bus Enable Time[4,5] S_{N-M} to N_X or M_X		1.5	—	5.0	

Notes:
1. See test circuit and waveforms.
2. This parameter is guaranteed but not tested on Propagation Delays.
3. The bus switch contributes no propagational delay other than the RC delay of the ON resistance of the switch and the load capacitance. Propagational delay of the bus switch when used in a system is determined by the driving circuit on the driving side of the switch and its interaction with the load on the driven side.
4. Where N_0 is Bit 0 of any port N = A - J and M_0 is Bit 0 of any other port.
5. Where N_X is Bit X (X = 0 - 17) of any port N = A - J and N_X is Bit X (X = 0 - 17) of any other port.

Test Circuits



Switch Position

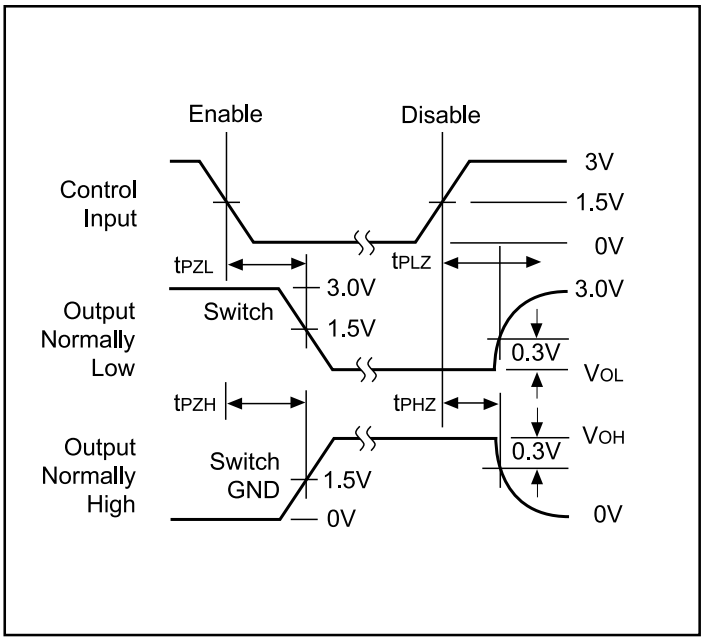
Test	Switch
Disable LOW Enable LOW	Closed
tpd	Open

Definitions:

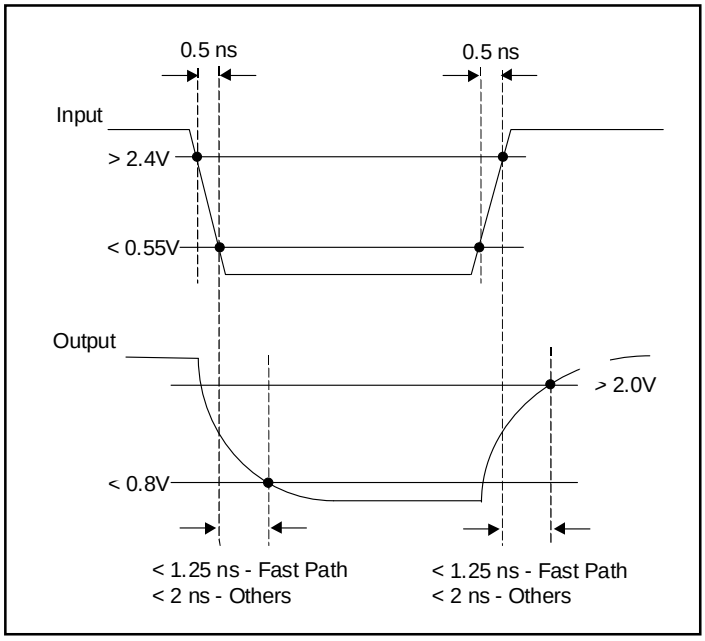
C_L = Load capacitance: includes jig and probe capacitance.

R_T = Termination resistance: should be equal to Z_{OUT} of the Pulse Generator

Enable and Disable Timing



Propagation Delay



256-Pin Ball Grid Array Package (27 × 27mm)
