

Cortina Systems® LXT972A Single-Port 10/100 Mbps PHY Transceiver

Datasheet

The Cortina Systems® LXT972A Single-Port 10/100 Mbps PHY Transceiver (LXT972A PHY) directly supports both 100BASE-TX and 10BASE-T applications. The LXT972A PHY is IEEE compliant and provides a Media Independent Interface (MII) for easy attachment to 10/100 Media Access Controllers (MACs). The LXT972A PHY supports full-duplex operation at 10 Mbps and 100 Mbps. Operating conditions for the LXT972A PHY can be set using auto-negotiation, parallel detection, or manual control. The LXT972A PHY is fabricated with an advanced CMOS process and requires only a single 2.5/3.3 V power supply with 2.5 V MII interface support.

Applications

- Combination 10BASE-T/100BASE-TX Network Interface Cards (NICs)
- Network printers
- 10/100 Mbps PCMCIA cards
- Cable Modems and Set-Top Boxes

Product Features

- 3.3 V Operation
- Low power consumption (300 mW typical)
- 10BASE-T and 100BASE-TX using a single RJ-45 connection
- IEEE 802.3-compliant 10BASE-T or 100BASE-TX ports with integrated filters
- Auto-negotiation and parallel detection
- MII interface with extended register capability
- Robust baseline wander correction
- Carrier Sense Multiple Access / Collision Detection (CSMA/CD) or full-duplex operation
- JTAG boundary scan
- MDIO serial port or hardware pin configurable
- Integrated, programmable LED drivers
- 64-Pin Low-profile Quad Flat Package (LQFP) LXT972ALC - Commercial (0° to 70 °C amb.)

4.0 Signal Descriptions

Cortina recommends the following configurations for unused pins:

- **Unused inputs.** Configure all unused inputs and unused multi-function pins for inactive states.
- **Unused outputs.** Leave all unused outputs floating.
- **No connects.** Do not use pins designated as NC (no connect), and do not terminate them.

Note: Table 4 list the signal type abbreviations used in the signal tables.

Table 4 PHY Signal Types

| Abbreviation | Definition |
|--------------|---------------|
| AI | Analog Input |
| AO | Analog Output |
| I | Input |
| I/O | Input/Output |
| O | Output |
| OD | Open Drain |

Table 5 MII Data Interface Signal Descriptions

| LQFP Pin# | Symbol | Type | Signal Description |
|----------------------|------------------------------|------|---|
| 60 59 58 57 | TXD3 TXD2 TXD1 TXD0 | I | Transmit Data. TXD is a group of parallel data signals that are driven by the MAC. TXD[3:0] transition synchronously with respect to TX_CLK. TXD[0] is the least-significant bit. |
| 56 | TX_EN | I | Transmit Enable. The MAC asserts this signal when it drives valid data on TXD. This signal must be synchronized to TX_CLK. |
| 55 | TX_CLK | O | Transmit Clock. TX_CLK is sourced by the PHY in both 10 and 100 Mbps operations. 2.5 MHz for 10 Mbps operation 25 MHz for 100 Mbps operation. |
| 45 46 47 48 | RXD3 RXD2 RXD1 RXD0 | O | Receive Data. RXD is a group of parallel signals that transition synchronously with respect to RX_CLK. RXD[0] is the least-significant bit. |
| 49 | RX_DV | O | Receive Data Valid. The PHY asserts this signal when it drives valid data on RXD. This output is synchronous to RX_CLK. |
| 53 | RX_ER | O | Receive Error. Signals a receive error condition has occurred. This output is synchronous to RX_CLK. |
| 54 | TX_ER | I | Transmit Error. Signals a transmit error condition. This signal must be synchronized to TX_CLK. |
| 52 | RX_CLK | O | Receive Clock. 25 MHz for 100 Mbps operation. 2.5 MHz for 10 Mbps operation. For details, see Section 5.3.2, Clock Requirements, on page 26 in the Functional Description section. |
| 62 | COL | O | Collision Detected. The PHY asserts this output when a collision is detected. This output remains High for the duration of the collision. This signal is asynchronous and is inactive during full- duplex operation. |
| 63 | CRS | O | Carrier Sense. During half-duplex operation (register bit 0.8 = 0), the PHY asserts this output when either transmitting or receiving data packets. During full-duplex operation (register bit 0.8 = 1), CRS is asserted only during receive. CRS assertion is asynchronous with respect to RX_CLK. CRS is de-asserted on loss of carrier, synchronous to RX_CLK. |

Table 6 MII Controller Interface Signal Descriptions

| LQFP Pin# | Symbol | Type | Signal Description ⁵ |
|-----------|---------|------|--|
| 3 | MDDIS | I | <p>Management Data Disable. When MDDIS is High, the MDIO is disabled from read and write operations. When MDDIS is Low at power-up or reset, the Hardware Control Interface pins control only the initial or "default" values of their respective register bits. After the power-up/reset cycle is complete, bit control reverts to the MDIO serial channel.</p> |
| 43 | MDC | I | <p>Management Data Clock. Clock for the MDIO serial data channel. Maximum frequency is 8 MHz.</p> |
| 42 | MDIO | I/O | <p>Management Data Input/Output. Bidirectional serial data channel for PHY/STA communication.</p> |
| 64 | MDINT_L | OD | <p>Management Data Interrupt. When register bit 18.1 = 1, a Low output on this active-low pin indicates a status change. Interrupt is cleared by reading Register 19.</p> |

Table 7 LXT972A: Network Interface Signal Descriptions

| LQFP Pin# | Symbol | Type | Signal Description |
|-----------|--------------|------|--|
| 19 20 | TPOP TPON | O | <p>Twisted-Pair Outputs, Positive and Negative. During 100BASE-TX or 10BASE-T operation, TPOP/N pins drive IEEE 802.3 compliant pulses onto the line.</p> |
| 23 24 | TPIP TPIN | I | <p>Twisted-Pair Inputs, Positive and Negative. During 100BASE-TX or 10BASE-T operation, TPIP/N pins receive differential 100BASE-TX or 10BASE-T signals from the line.</p> |

Table 8 LXT972A: Standard Bus and Interface Signal Descriptions

| LQFP Pin# | Symbol | Type | Signal Description |
|-----------|--------|------|--|
| 12 | ADDR0 | I | <p>Address 0. Sets device address.</p> |

Table 9 LXT972A: Configuration and LED Driver Signal Descriptions

| LQFP Pin# | Symbol | Type | Signal Description | | |
|--|----------------------------------|------------|---|---------|--------------------------------|
| Note: Implement 10 kΩ pull-up/pull-down resistors if LEDs are not used in the design. | | | | | |
| 5 6 | TxSLEW0 TxSLEW1 | I | Tx Output Slew Controls 0 and 1. These pins select the TX output slew rate (rise and fall time) as follows: | | |
| | | | TxSLEW1 | TxSLEW0 | Slew Rate (Rise and Fall Time) |
| | | | 0 | 0 | 3.0 ns |
| | | | 0 | 1 | 3.4 ns |
| | | | 1 | 0 | 3.9 ns |
| 1 | 1 | 4.4 ns | | | |
| 4 | $\overline{\text{RESET_L}}$ | I | Reset. This active Low input is ORed with the control register Reset bit (register bit 0.15). The PHY reset cycle is extended to 258 μs (nominal) after reset is de-asserted. | | |
| 17 | RBIAS | AI | Reference Current Bias. This pin provides bias current for the internal circuitry. Must be tied to ground through a 22.1 kΩ, 1% resistor. | | |
| 33 | PAUSE | I | Pause. When set High, the PHY advertises Pause capabilities during auto-negotiation. | | |
| 39 | PWRDWN | I | Power Down. When set High, this pin puts the PHY in a power-down mode. | | |
| 1 2 | REFCLK/XI XO | I and O | Reference Clock Input / Crystal Input and Crystal Output. A 25 MHz crystal oscillator circuit can be connected across XI and XO. A clock can also be used at XI. Refer to Section 5.3.2, Clock Requirements, on page 26 in the Functional Description section. | | |

5.0 Functional Description

This chapter has the following sections:

- Section 5.1, *Device Overview*, on page 21
- Section 5.2, *Network Media / Protocol Support*, on page 22
- Section 5.3, *Operating Requirements*, on page 25
- Section 5.4, *Initialization*, on page 26
- Section 5.5, *Establishing Link*, on page 28
- Section 5.6, *MII Operation*, on page 30
- Section 5.7, *100 Mbps Operation*, on page 35
- Section 5.8, *10 Mbps Operation*, on page 42
- Section 5.9, *Monitoring Operations*, on page 43
- Section 5.10, *Boundary Scan (JTAG 1149.1) Functions*, on page 45

5.1 Device Overview

The LXT972A PHY is a single-port Fast Ethernet 10/100 PHY that supports 10 Mbps and 100 Mbps networks. It complies with applicable requirements of IEEE 802.3. It directly drives either a 100BASE-TX line or a 10BASE-T line.

5.1.1 Comprehensive Functionality

The LXT972A PHY provides a standard Media Independent Interface (MII) for 10/100 MACs. The LXT972A PHY performs all functions of the Physical Coding Sublayer (PCS) and Physical Media Attachment (PMA) sublayer as defined in the IEEE 802.3 100BASE-X standard. It also performs all functions of the Physical Media Dependent (PMD) sublayer for 100BASE-TX connections.

The LXT972A PHY reads its configuration pins on power-up to check for forced operation settings.

If the LXT972A PHY is not set for forced operation, it uses auto-negotiation/parallel detection to automatically determine line operating conditions. If the PHY device on the other side of the link supports auto-negotiation, the LXT972A PHY auto-negotiates with it using Fast Link Pulse (FLP) Bursts. If the PHY partner does not support auto-negotiation, the LXT972A PHY automatically detects the presence of either link pulses (10 Mbps PHY) or Idle symbols (100 Mbps PHY) and sets its operating conditions accordingly.

The LXT972A PHY provides half-duplex and full-duplex operation at 100 Mbps and 10 Mbps.

5.1.2 Optimal Signal Processing Architecture

The LXT972A PHY incorporates high-efficiency Optimal Signal Processing (OSP) design techniques, which combine optimal properties of digital and analog signal processing.

The receiver utilizes decision feedback equalization to increase noise and cross-talk immunity by as much as 3 dB over an ideal all-analog equalizer. Using OSP mixed-signal processing techniques in the receive equalizer avoids the quantization noise and

calculation truncation errors found in traditional DSP-based receivers (typically complex DSP engines with A/D converters). This results in improved receiver noise and cross-talk performance.

The OSP signal processing scheme also requires substantially less computational logic than traditional DSP-based designs. This lowers power consumption and also reduces the logic switching noise generated by DSP engines. This logic switching noise can be a considerable source of EMI generated on the device's power supplies.

The OSP-based LXT972A PHY provides improved data recovery, EMI performance, and low power consumption.

5.2 Network Media / Protocol Support

This section includes the following:

- [Section 5.2.1, 10/100 Network Interface](#)
- [Section 5.2.2, MII Data Interface](#)
- [Section 5.2.3, Configuration Management Interface](#)

The LXT972A PHY supports both 10BASE-T and 100BASE-TX Ethernet over twisted-pair

5.2.1 10/100 Network Interface

The network interface port consists of two differential signal pairs. For specific pin assignments, see [Section 4.0, Signal Descriptions, on page 15](#).

The LXT972A PHY output drivers can generate one of the following outputs:

- 100BASE-TX
- 10BASE-T

When not transmitting data, the LXT972A PHY generates IEEE 802.3-compliant link pulses or idle code. Depending on the mode selected, input signals are decoded as one of the following:

- 100BASE-TX
- 10BASE-T

Auto-negotiation/parallel detection or manual control is used to determine the speed of this interface.

5.2.1.1 Twisted-Pair Interface

The LXT972A PHY supports either 100BASE-TX or 10BASE-T connections over 100 Ω , Category 5, Unshielded Twisted Pair (UTP) cable. When operating at 100 Mbps, the LXT972A PHY continuously transmits and receives MLT3 symbols. When not transmitting data, the LXT972A PHY generates "IDLE" symbols.

During 10 Mbps operation, Xilinx* Manchester-encoded data is exchanged. When no data is being exchanged, the line is left in an idle state. Link pulses are transmitted periodically to keep the link up.

Only a transformer, RJ-45 connector, load resistor and bypass capacitors are required to complete this interface. On the transmit side, the LXT972A PHY has an active internal termination and does not require external termination resistors. Cortina's waveshaping technology shapes the outgoing signal to help reduce the need for external EMI filters. Four slew rate settings allow the designer to match the output waveform to the magnetic

characteristics. On the receive side, the internal impedance is high enough that it has no practical effect on the external termination circuit. (For the slew rate settings, see [Table 55, Transmit Control Register - Address 30, Hex 1E, on page 78.](#))

5.2.1.2 Remote Fault Detection and Reporting

The LXT972A PHY supports the remote fault detection and reporting mechanisms. “Remote Fault” refers to a MAC-to-MAC communication function that is transparent to PHY layer devices. It is used only during auto-negotiation, and is applicable only to twisted-pair links.

Remote Fault Detection. register bit 4.13 in the Auto-Negotiation Advertisement Register is reserved for Remote Fault indications. It is typically used when re-starting the auto-negotiation sequence to indicate to the link partner that the link is down because the advertising device detected a local fault.

When the LXT972A PHY receives a Remote Fault indication from its partner during auto-negotiation, the following occurs:

- register bit 5.13 in the Link Partner Base Page Ability Register is set.
- Remote Fault register bit 1.4 in the MII Status Register is set to pass this information to the local controller.

5.2.2 MII Data Interface

The LXT972A PHY supports a standard Media Independent Interface (MII). The MII consists of a data interface and a management interface. The MII Data Interface passes data between the LXT972A PHY and a Media Access Controller (MAC). Separate parallel buses are provided for transmit and receive. This interface operates at either 10 Mbps or 100 Mbps. The speed is set automatically, once the operating conditions of the network link have been determined. For details, see [Section 5.6, MII Operation, on page 30.](#)

Increased MII Drive Strength. A higher Media Independent Interface (MII) drive strength may be desired in some designs to drive signals over longer PCB trace lengths, or over high-capacitive loads, through multiple vias, or through a connector. The MII drive strength in the LXT972A PHY can be increased by setting register bit 26.11 through software control. Setting register bit 26.11 = 1 through the MDC/MDIO interface sets the MII pins (RXD[3:0], RX_DV, RX_CLK, RX_ER, COL, CRS, and TX_CLK) to a higher drive strength.

5.2.3 Configuration Management Interface

The LXT972A PHY provides both an MDIO interface and a reduced hardware control interface for device configuration and management.

5.2.3.1 MDIO Management Interface

MDIO management interface topics include the following:

- [Section 5.2.3.1.1, MDIO Addressing](#)
- [Section 5.2.3.1.2, MDIO Frame Structure](#)

The LXT972A PHY supports the IEEE 802.3 MII Management Interface also known as the Management Data Input/Output (MDIO) Interface. This interface allows upper-layer devices to monitor and control the state of the LXT972A PHY. The MDIO interface consists of a physical connection, a specific protocol that runs across the connection, and an internal set of addressable registers.

Some registers are required and their functions are defined by the IEEE 802.3 standard. The LXT972A PHY also supports additional registers for expanded functionality. The LXT972A PHY supports multiple internal registers, each of which is 16 bits wide. Specific register bits are referenced using an “X.Y” notation, where X is the register number (0-31) and Y is the bit number (0-15).

The physical interface consists of a data line (MDIO) and clock line (MDC). Operation of this interface is controlled by the MDDIS input pin. When MDDIS is High, the MDIO read and write operations are disabled and the Hardware Control Interface provides primary configuration control. When MDDIS is Low, the MDIO port is enabled for both read and write operations and the Hardware Control Interface is not used.

5.2.3.1.1 MDIO Addressing

The MDIO addressing protocol allows a controller to communicate with multiple PHYs. Pin ADDR0 determines the PHY device address that is selected as follows.

- Connect pin ADDR0 low to get PHY address 0.
- Connect pin ADDR0 high to get PHY address 1.

5.2.3.1.2 MDIO Frame Structure

The physical interface consists of a data line (MDIO) and clock line (MDC). The frame structure is shown in Figure 3 and Figure 4 (Read and Write).

MDIO Interface timing is given in Section 7.0, *Electrical Specifications*.

Figure 3 Management Interface Read Frame Structure

Figure 4 Management Interface Write Frame Structure

5.2.3.1.3 MII Interrupts

Figure 5 shows the MII interrupt logic. The LXT972A PHY provides a hardware interrupt pin (MDINT_L) and two dedicated interrupt registers, Register 18 and Register 19.

- Register 18 provides interrupt enable and mask functions. Setting register bit 18.1 = 1 enables the device to request interrupt via the MDINT_L pin. An active Low on this pin

indicates a status change on the LXT972A PHY. Interrupts may be caused by any of the following four conditions:

- Auto-negotiation complete
 - Speed status change
 - Duplex status change
 - Link status change
- Register 19 provides the interrupt status.

Figure 5 MII Interrupt Logic

5.2.3.1.4 MII Status Change Register

MII status change is indicated in Register 19 by any of the following four conditions:

- Auto-negotiation complete
- Speed status change
- Duplex status change
- Link status change

5.2.3.2 Hardware Control Interface

The LXT972A PHY provides a Hardware Control Interface for applications where the MDIO is not desired. The Hardware Control Interface uses the hardware configuration pins to set device configuration. For details, see Section 5.4.4, *Hardware Configuration Settings*, on page 28.

5.3 Operating Requirements

5.3.1 Power Requirements

The LXT972A PHY requires three power supply inputs:

- VCCA
- VCCD
- VCCIO

The digital and analog circuits require 3.3 V supplies (VCCA and VCCD). These inputs may be supplied from a single source. Each supply input must be de-coupled to ground.

An additional supply may be used for the MII (VCCIO). The supply may be either 2.5 V or 3.3 V. Also, the inputs on the MII interface are tolerant to 5 V signals from the controller on the other side of the MII interface. For MII I/O characteristics, see [Table 23, Digital I/O Characteristics¹ - MII Pins](#), on page 52.

Notes:

1. Bring up power supplies as close to the same time as possible.
2. As a matter of good practice, keep power supplies as clean as possible.

5.3.2 Clock Requirements

5.3.2.1 External Crystal/Oscillator

The LXT972A PHY requires a reference clock input that is used to generate transmit signals and recover receive signals. It may be provided by either of two methods: by connecting a crystal across the oscillator pins (XI and XO) with load capacitors, or by connecting an external clock source to pin XI.

The connection of a clock source to the XI pin requires the XO pin to be left open. To minimize transmit jitter, Cortina recommends a crystal-based clock instead of a derived clock (that is, a PLL-based clock).

A crystal is typically used in NIC applications. An external 25 MHz clock source, rather than a crystal, is frequently used in switch applications. For clock timing requirements, see [Table 24, I/O Characteristics - REFCLK/XI and XO Pins](#), on page 53.

5.3.2.2 MDIO Clock

The MII management channel (MDIO) also requires an external clock. The managed data clock (MDC) speed is a maximum of 8 MHz.

5.4 Initialization

This section includes the following topics:

- [Section 5.4.1, MDIO Control Mode and Hardware Control Mode](#)
- [Section 5.4.2, Reduced-Power Modes](#)
- [Section 5.4.3, Reset](#)
- [Section 5.4.4, Hardware Configuration Settings](#)

When the LXT972A PHY is first powered on, reset, or encounters a link failure state, it checks the MDIO register configuration bits to determine the line speed and operating conditions to use for the network link.

[Table 13](#) shows the LXT972A PHY initialization sequence. The configuration bits may be set by the Hardware Control or MDIO interface.

5.4.1 MDIO Control Mode and Hardware Control Mode

In the MDIO Control mode, the LXT972A PHY reads the Hardware Control Interface pins to set the initial (default) values of the MDIO registers. Once the initial values are set, bit control reverts to the MDIO interface.

The following modes are available using either Hardware Control or MDIO control:

- Force network link operation to:
 - 100BASE-TX, Full-Duplex
 - 100BASE-TX, Half-Duplex
 - 10BASE-T, Full-Duplex
 - 10BASE-T, Half-Duplex
- Allow auto-negotiation/parallel-detection

On power-up or hardware reset, the LXT972A PHY reads the Hardware Control Interface pins and sets the MDIO registers accordingly.

When the network link is forced to a specific configuration, the LXT972A PHY immediately begins operating the network interface as commanded. When auto-negotiation is enabled, the LXT972A PHY begins the auto-negotiation/parallel-detection operation.

5.4.2 Reduced-Power Modes

This section discusses the LXT972A PHY reduced-power modes.

5.4.2.1 Hardware Power Down

The hardware power-down mode is controlled by the PWRDWN pin. When PWRDWN is High, the following conditions are true:

- The LXT972A PHY network port and clock are shut down.
- All outputs are tristated.
- All weak pad pull-up and pull-down resistors are disabled.
- The MDIO registers are not accessible.

5.4.2.2 Software Power Down

Software power-down control is provided by register bit 0.11 in the Control Register. During soft power-down, the following conditions are true:

- The network port is shut down.
- The MDIO registers remain accessible.

5.4.3 Reset

The LXT972A PHY provides both hardware and software resets, each of which manage differently the configuration control of auto-negotiation, speed, and duplex-mode selection.

For a software reset, register bit 0.15 = 1. For register bit definitions used for software reset, see [Table 39, Control Register - Address 0, Hex 0, on page 64](#).

- During a software reset, bit settings in [Table 43, Auto-Negotiation Advertisement Register - Address 4, Hex 4, on page 67](#) are not re-read from the LXT972A PHY configuration pins. Instead, the bit settings revert to the values that were read in during the last hardware reset. Therefore, any changes to pin values made since the last hardware reset are not detected during a software reset.
- During a software reset, registers are available for reading. To see when the LXT972A PHY has completed reset, the reset bit can be polled (that is, register bit 0.15 = 0).

For pin settings used during a hardware reset, see [Section 5.4.4, Hardware Configuration Settings](#). During a hardware reset, configuration settings for auto-negotiation and speed are read in from pins, and register information is unavailable for 1 ms after de-assertion of the reset.

5.4.4 Hardware Configuration Settings

The LXT972A PHY provides a hardware option to set the initial device configuration. As listed in [Table 13](#), the hardware option uses the hardware configuration pins, the settings for which provide control bits.

Table 13 Hardware Configuration Settings

| Desired Mode | | | LED/CFG Pin Settings ¹ | | | Resulting register bit Values | | | | | | |
|--------------|--------------|--------------|-----------------------------------|---|---|-------------------------------|------------|-----------------|---|-----------------|---------------------------|---------------|
| | | | | | | Control Register | | | Auto-Negotiation Advertisement Register | | | |
| Auto-Neg. | Speed (Mbps) | Duplex | 1 | 2 | 3 | Auto-Neg. 0.12 | Speed 0.13 | Full-Duplex 0.8 | 100 BASE-TX Full-Duplex 4.8 | 100 BASE-TX 4.7 | 10 BASE-T Full-Duplex 4.6 | 10 BASE-T 4.5 |
| Disabled | 10 | Half | L | L | L | 0 | 0 | 0 | N/A Auto-Negotiation Advertisement | | | |
| | | Full | L | L | H | | 0 | 1 | | | | |
| | 100 | Half | L | H | L | | 1 | 0 | | | | |
| | | Full | L | H | H | | 1 | 1 | | | | |
| Enabled | 100 Only | Half | H | L | L | 1 | 1 | 0 | 0 | 1 | 0 | 0 |

| | | Full or Half | H | H | H | | 1 | 1 | 1 | 1 | 1 | 1 |

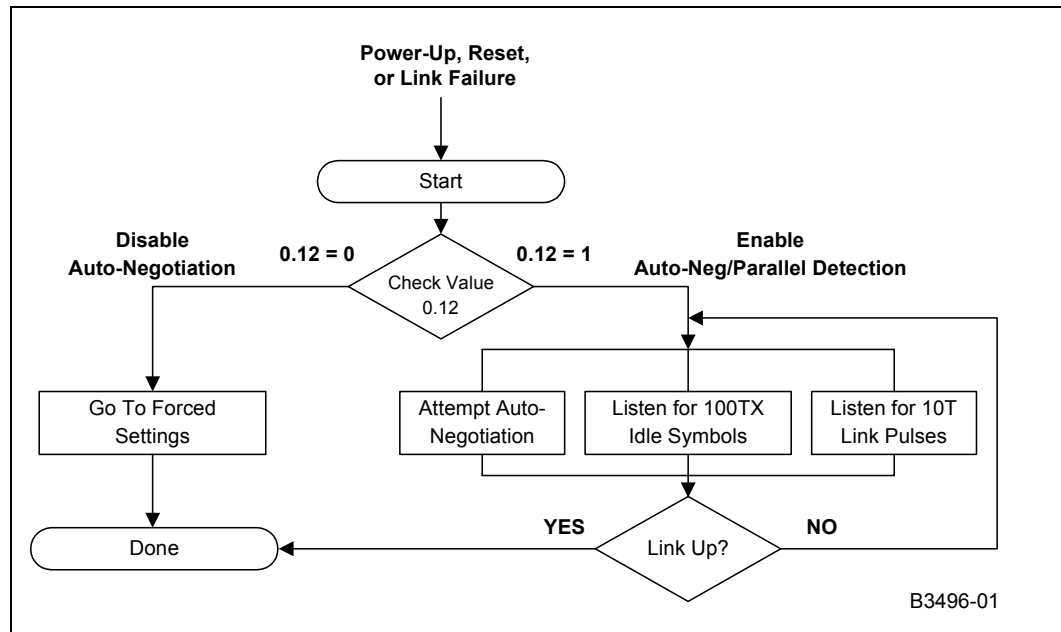

1. L = Low, and H = High. For LED/CFG pin assignments, see [Section 3.0, Ball and Pin Assignments](#)

5.5 Establishing Link

[Figure 6](#) shows an overview of link establishment for the LXT972A PHY.

Note: When a link is established by using parallel detection, the LXT972A PHY sets the duplex mode to half-duplex, as defined by the IEEE 802.3 standard.

Figure 6 Link Establishment Overview

5.5.1 Auto-Negotiation

If not configured for forced operation, the LXT972A PHY attempts to auto-negotiate with its link partner by sending Fast Link Pulse (FLP) bursts. Each burst consists of up to 33 link pulses spaced 62.5 μ s apart. Odd link pulses (clock pulses) are always present. Even link pulses (data pulses) may be absent or present to indicate a ‘0’ or a ‘1’. Each FLP burst exchanges 16 bits of data, which are referred to as a “link code word”. All devices that support auto-negotiation must implement the “Base Page” defined by the IEEE 802.3 standard (Registers 4 and 5).

The LXT972A PHY also supports the optional “Next Page” function as listed in [Table 46, Auto-Negotiation Next Page Transmit Register - Address 7, Hex 7, on page 69](#) and [Table 47, Auto-Negotiation Link Partner Next Page Receive Register - Address 8, Hex 8, on page 70](#).

5.5.1.1 Base Page Exchange

By exchanging Base Pages, the LXT972A PHY and its link partner communicate their capabilities to each other. Both sides must receive at least three consecutive identical base pages for negotiation to continue. Each side identifies the highest common capabilities that both sides support, and each side configures itself accordingly.

5.5.1.2 Manual Next Page Exchange

“Next Page Exchange” information is additional information that exceeds the information required by Base Page exchange and that is sent by “Next Pages”. The LXT972A PHY fully supports the IEEE 802.3 standard method of negotiation through the Next Page exchange.

The Next Page exchange uses Register 7 to send information and Register 8 to receive it. Next Page exchange occurs only if both ends of the link partners advertise their ability to exchange Next Pages. register bit 6.1 is used to make manual next page exchange easier for software. This register bit is cleared when a new negotiation occurs, preventing the user from reading an old value in Register 6 and assuming there is valid information in Registers 5 and 8.

5.5.1.3 Controlling Auto-Negotiation

When auto-negotiation is controlled by software, Cortina recommends the following steps:

1. After power-up, power-down, or reset, the power-down recovery time (specified in [Table 37, RESET_L Pulse Width and Recovery Timing, on page 62](#)) must be exhausted before proceeding.
2. Set the Auto-Negotiation Advertisement register bits.
3. Enable auto-negotiation. (Set MDIO register bit 0.12 = 1.)
4. To ensure proper operation, enable or restart auto-negotiation as soon as possible after writing to Register 4.

5.5.2 Parallel Detection

In parallel with auto-negotiation, the LXT972A PHY also monitors for 10 Mbps Normal Link Pulses (NLP) or 100 Mbps Idle symbols. If either symbol is detected, the device automatically reverts to the corresponding speed in half-duplex mode. Parallel detection allows the LXT972A PHY to communicate with devices that do not support auto-negotiation.

When parallel detection resolves a link, the link must be established in half-duplex mode. According to IEEE standards, the forced link partner cannot be configured to full-duplex. If the auto-negotiation link partner does not advertise half-duplex capability at the speed of the forced link partner, link is not established. The IEEE Standard prevents full-duplex-to-half-duplex link connections.

5.6 MII Operation

This section includes the following topics:

- [Section 5.6.1, MII Clocks](#)
- [Section 5.6.2, Transmit Enable](#)
- [Section 5.6.3, Receive Data Valid](#)
- [Section 5.6.4, Carrier Sense](#)
- [Section 5.6.5, Error Signals](#)
- [Section 5.6.6, Collision](#)
- [Section 5.6.7, Loopback](#)

The LXT972A PHY implements the Media Independent Interface (MII) as defined by the IEEE 802.3 standard. Separate channels are provided for transmitting data from the MAC to the LXT972A PHY (TXD), and for passing data received from the line (RXD) to the MAC. Each channel has its own clock, data bus, and control signals.

The following signals are used to pass received data to the MAC:

- COL

- CRS
- RX_CLK
- RX_DV
- RX_ER
- RXD[3:0]

The following signals are used to transmit data from the MAC:

- TX_CLK
- TX_EN
- TX_ER
- TXD[3:0]

The LXT972A PHY supplies both clock signals as well as separate outputs for carrier sense and collision. Data transmission across the MII is normally implemented in 4-bit-wide nibbles.

5.6.1 MII Clocks

The LXT972A PHY is the master clock source for data transmission, and it supplies both MII clocks (RX_CLK and TX_CLK). It automatically sets the clock speeds to match link conditions.

- When the link is operating at 100 Mbps, the clocks are set to 25 MHz.
- When the link is operating at 10 Mbps, the clocks are set to 2.5 MHz.

Figure 7 through Figure 9 show the clock cycles for each mode.

Note: The transmit data and control signals must always be synchronized to TX_CLK by the MAC. The LXT972A PHY samples these signals on the rising edge of TX_CLK.

Figure 7 Clocking for 10BASE-T

Figure 8 Clocking for 100BASE-X

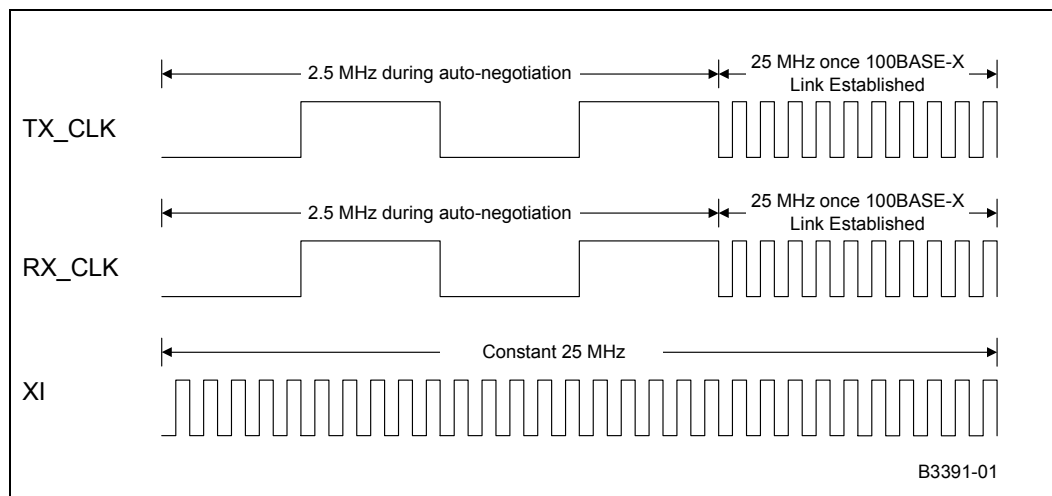

Figure 9 Clocking for Link Down Clock Transition

5.6.2 Transmit Enable

The MAC must assert TX_EN the same time as the first nibble of preamble and de-assert TX_EN after the last nibble of the packet.

5.6.3 Receive Data Valid

The LXT972A PHY asserts RX_DV when it receives a valid packet. Timing changes depend on line operating speed:

- For 100BASE-TX links, RX_DV is asserted from the first nibble of preamble to the last nibble of the data packet.
- For 10BASE-T links, the entire preamble is truncated. RX_DV is asserted with the first nibble of the Start of Frame Delimiter (SFD) “5D” and remains asserted until the end of the packet.

5.6.4 Carrier Sense

Carrier Sense (CRS) is an asynchronous output.

- CRS is always generated when the LXT972A PHY receives a packet from the line.
- CRS is also generated when the LXT972A PHY is in half-duplex mode when a packet is transmitted.

Table 14 summarizes the conditions for assertion of carrier sense, data loopback, and collision signals. Carrier sense is not generated when a packet is transmitted and in full-duplex mode.

Table 14 Carrier Sense, Loopback, and Collision Conditions

| Speed | Duplex Condition | Carrier Sense | Test Loop-back ^{1, 2} | Operational Loop-back ^{1, 2} | Collision |
|----------|------------------------------------|---------------------|--------------------------------|---------------------------------------|----------------------|
| 100 Mbps | Full-Duplex | Receive Only | Yes | No | None |
| | Half-Duplex | Transmit or Receive | No | No | Transmit and Receive |
| 10 Mbps | Full-Duplex | Receive Only | Yes | No | None |
| | Half-Duplex, register bit 16.8 = 0 | Transmit or Receive | Yes | Yes | Transmit and Receive |
| | Half-Duplex, register bit 16.8 = 1 | Transmit or Receive | No | No | Transmit and Receive |

1. Test Loopback is enabled when register bit 0.14 = 1.
 2. For descriptions of Test Loopback and Operational Loopback, see [Section 5.6.7, Loopback, on page 33](#).

5.6.5 Error Signals

When the LXT972A PHY is in 100 Mbps mode and receives an invalid symbol from the network, it asserts RX_ER and drives “0101” on the RXD pins.

When the MAC asserts TX_ER, the LXT972A PHY drives “H” symbols out on the TPFOP/N pins.

5.6.6 Collision

The LXT972A PHY asserts its collision signal asynchronously to any clock whenever the line state is half-duplex and the transmitter and receiver are active at the same time.

Table 14 summarizes the conditions for assertion of carrier sense, data loopback, and collision signals.

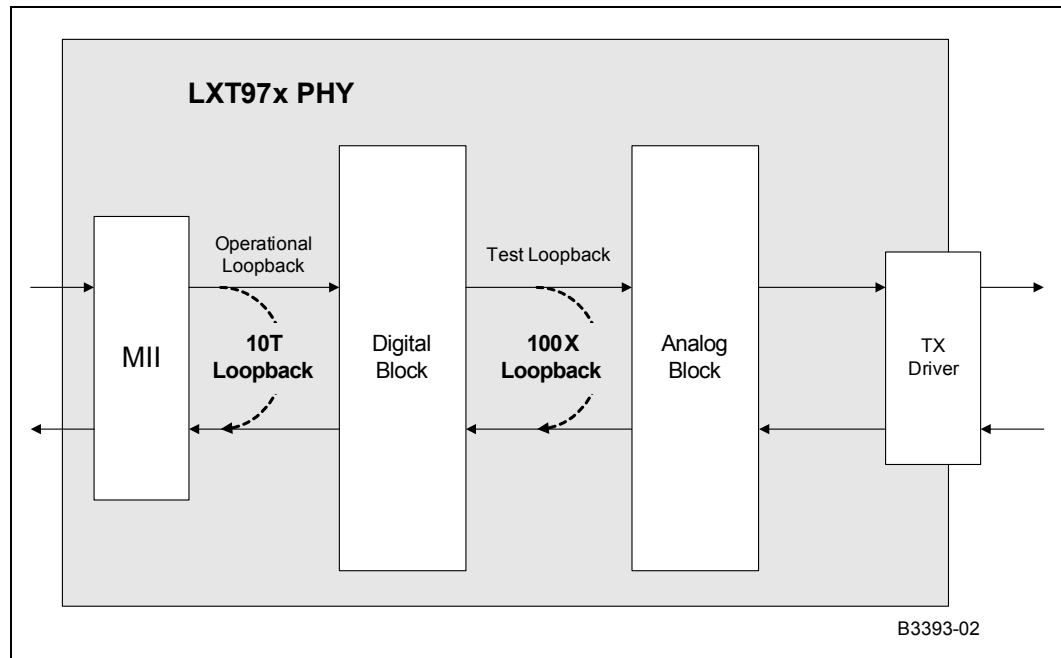

5.6.7 Loopback

The LXT972A PHY provides the following loopback functions:

- [Section 5.6.7.1, Operational Loopback](#)
- [Section 5.6.7.2, Internal Digital Loopback \(Test Loopback\)](#)

Figure 10 shows LXT972A PHY operational and test loopback paths. (An internal digital loopback path is not shown.) For more information on loopback functions, see [Table 14, Carrier Sense, Loopback, and Collision Conditions, on page 33](#).)

Figure 10 Loopback Paths

5.6.7.1 Operational Loopback

- Operational loopback is provided for 10 Mbps half-duplex links when register bit 16.8 = 0. Data that the MAC (TXData) transmits loops back on the receive side of the MII (RXData).
- Operational loopback is not provided for 100 Mbps links, full-duplex links, or when Register 16.8 = 1.

5.6.7.2 Internal Digital Loopback (Test Loopback)

A test loopback function is provided for diagnostic testing of the LXT972A PHY. During test loopback, twisted-pair interfaces are disabled. Data transmitted by the MAC is internally looped back by the LXT972A PHY and returned to the MAC.

Test loopback is available for both 100BASE-TX and 10BASE-T operation, and is enabled by setting the following register bits:

- register bit 0.14 = 1 (Setting to enable loopback mode)
- register bit 0.8 = 1 (Setting for full-duplex mode)
- register bit 0.12 = 0 (Disable auto-negotiation)

Note: Parallel detection can resolve the PHY configuration.

5.7 100 Mbps Operation

5.7.1 100BASE-X Network Operations

During 100BASE-X operation, the LXT972A PHY transmits and receives 5-bit symbols across the network link.

Figure 11 shows the structure of a standard frame packet in 100BASE-X mode. When the MAC is not actively transmitting data, the LXT972A PHY sends out Idle symbols on the line.

As Figure 11 shows, the MAC starts each transmission with a preamble pattern. As soon as the LXT972A PHY detects the start of preamble, it transmits a Start-of-Stream Delimiter (SSD, symbols J and K) to the network. It then encodes and transmits the rest of the packet, including the balance of the preamble, the SFD, packet data, and CRC.

Once the packet ends, the LXT972A PHY transmits the End-of-Stream Delimiter (ESD, symbols T and R) and then returns to transmitting Idle symbols.

For details on the symbols used, see 4B/5B coding listed in Table 15, 4B/5B Coding, on page 39.

Figure 11 100BASE-X Frame Format

As shown in Figure 12, in 100BASE-TX mode, the LXT972A PHY scrambles and transmits the data to the network using MLT-3 line code. MLT-3 signals received from the network are de-scrambled, decoded, and sent across the MII to the MAC.

Figure 12 100BASE-TX Data Path

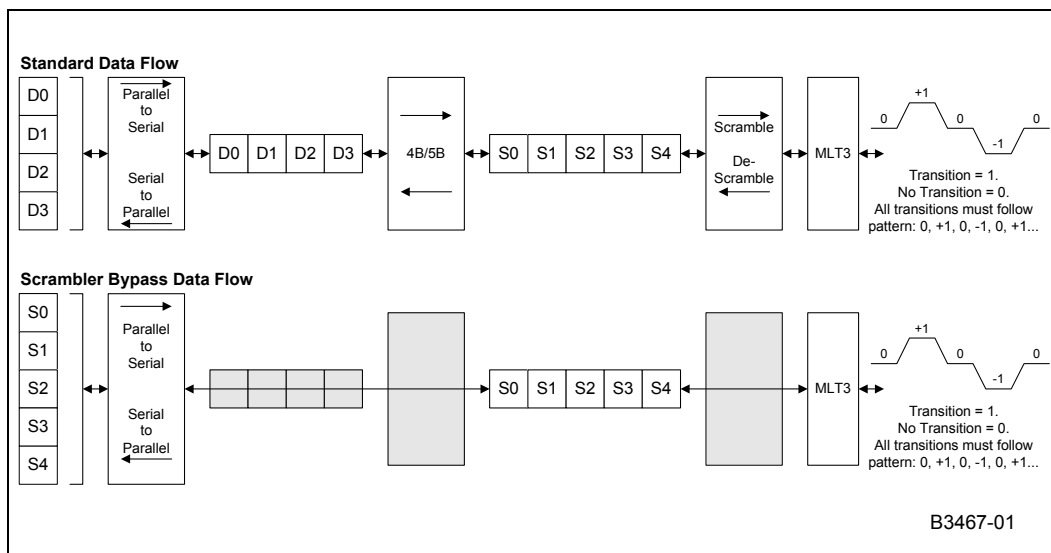

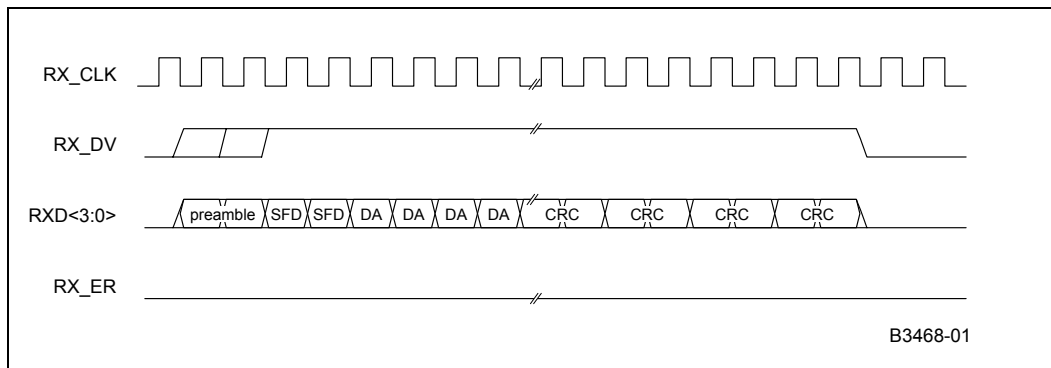

Figure 13 shows normal reception with no errors.

Figure 13 100BASE-TX Reception with No Errors

As shown in Figure 14, when the LXT972A PHY receives invalid symbols from the line, it asserts RX_ER.

Figure 14 100BASE-TX Reception with Invalid Symbol

5.7.2 Collision Indication

Figure 15 shows normal transmission.

Figure 15 100BASE-TX Transmission with No Errors

Upon detection of a collision, the COL output is asserted and remains asserted for the duration of the collision as shown in Figure 16.

Figure 16 100BASE-TX Transmission with Collision

5.7.3 100BASE-X Protocol Sublayer Operations

With respect to the 7-layer communications model, the LXT972A PHY is a Physical Layer 1 (PHY) device.

The LXT972A PHY implements the following sublayers of the reference model defined by the IEEE 802.3 standard, and discussed from the reference model point of view:

- Section 5.7.3.1, *Physical Coding Sublayer*
- Section 5.7.3.2, *Physical Medium Attachment Sublayer*
- Section 5.7.3.3, *Twisted-Pair Physical Medium Dependent Sublayer*

Figure 17 shows the LXT972A PHY protocol sublayers.

Figure 17 Protocol Sublayers

5.7.3.1 Physical Coding Sublayer

The Physical Coding Sublayer (PCS) provides the MII interface, as well as the 4B/5B encoding/decoding function.

For 100BASE-TX operation, the PCS layer provides IDLE symbols to the PMD-layer line driver as long as TX_EN is de-asserted.

5.7.3.1.1 Preamble Handling

When the MAC asserts TX_EN, the PCS substitutes a /J/K symbol pair, also known as the Start-of-Stream Delimiter (SSD), for the first two nibbles received across the MII. The PCS layer continues to encode the remaining MII data, following the 4B/5B coding in Table 15, until TX_EN is de-asserted. It then returns to supplying IDLE symbols to the line driver.

In the receive direction, the PCS layer performs the opposite function, substituting two preamble nibbles for the SSD. In 100 Mbps operation, preamble is always passed through the PCS layer to the MII interface.

Table 15 4B/5B Coding (Sheet 1 of 2)

| Code Type | 4B Code 3 2 1 0 | Name | 5B Code 4 3 2 1 0 | Interpretation |
|---|--------------------|----------------|----------------------|---|

| | Undefined | Invalid | 1 1 0 0 1 | Invalid |

1. The // (Idle) code group is sent continuously between frames.
2. The /J/ and /K/ (SSD) code groups are always sent in pairs, and /K/ follows /J/.
3. The /T/ and /R/ (ESD) code groups are always sent in pairs, and /R/ follows /T/.
4. An /H/ (Error) code group is used to signal an error condition.

5.7.3.2 Physical Medium Attachment Sublayer

5.7.3.2.1 Link

In 100 Mbps mode, link is established when the descrambler becomes locked and remains locked for approximately 50 ms. Link remains up unless the descrambler receives less than 16 consecutive idle symbols in any 2 ms period. This operation filters out small noise hits that may disrupt the link.

For short periods, MLT-3 idle waveforms meet all criteria for 10BASE-T start delimiters. A working 10BASE-T receive may temporarily indicate link to 100BASE-TX waveforms. However, the PHY does not bring up a permanent 10 Mbps link.

The LXT972A PHY reports link failure through the MII status bits (register bits 1.2 and 17.10) and interrupt functions. Link failure causes the LXT972A PHY to re-negotiate if auto-negotiation is enabled.

5.7.3.2.2 Link Failure Override

The LXT972A PHY normally transmits data packets only if it detects the link is up. Setting register bit 16.14 = 1 overrides this function, allowing the LXT972A PHY to transmit data packets even when the link is down. This feature is provided as a transmit diagnostic tool.

Note: Auto-negotiation must be disabled to transmit data packets in the absence of link. If auto-negotiation is enabled, the LXT972A PHY automatically transmits FLP bursts if the link is down.

Caution: During normal operation, Cortina does not recommend setting register bit 16.14 for 100 Mbps receive functions because receive errors may be generated.

5.7.3.2.3 Carrier Sense

For 100BASE-TX links, a start-of-stream delimiter (SSD) or /J/K symbol pair causes assertion of carrier sense (CRS). An end-of-stream delimiter (ESD) or /T/R symbol pair causes de-assertion of CRS. The PMA layer also de-asserts CRS if IDLE symbols are received without /T/R. However, in this case RX_ER is asserted for one clock cycle when CRS is de-asserted.

Cortina does not recommend using CRS for Interframe Gap (IFG) timing for the following reasons:

- CRS de-assertion time is slightly longer than CRS assertion time. As a result, an IFG interval appears somewhat shorter to the MAC than it actually is on the wire.
- CRS de-assertion is not aligned with TX_EN de-assertion on transmit loopbacks in half-duplex mode.

5.7.3.2.4 Receive Data Valid

The LXT972A PHY asserts RX_DV to indicate that the received data maps to valid symbols. In 100 Mbps operation, RX_DV is active with the first nibble of preamble.

5.7.3.3 Twisted-Pair Physical Medium Dependent Sublayer

The twisted-pair Physical Medium Dependent (PMD) layer provides signal scrambling and de-scrambling functions, line coding and decoding functions (MLT-3 for 100BASE-TX, Manchester for 10BASE-T), as well as receiving, polarity correction, and baseline wander correction functions.

5.7.3.3.1 Scrambler/Descrambler

The purpose of the scrambler/descrambler is to spread the signal power spectrum and further reduce EMI using an 11-bit, data-independent polynomial. The receiver automatically decodes the polynomial whenever IDLE symbols are received.

Scrambler Seeding. Once the transmit data (or Idle symbols) are properly encoded, they are scrambled to further reduce EMI and to spread the power spectrum using an 11-bit scrambler seed. Five seed bits are determined by the PHY address, and the remaining bits are hard coded in the design.

Scrambler Bypass. The scrambler/de-scrambler can be bypassed by setting register bit 16.12 = 1. Scrambler bypass is provided for diagnostic and test support.

5.7.3.3.2 Polarity Correction

The 100 Mbps twisted pair signaling is not polarity sensitive. As a result, the polarity status is not a valid status indicator.

5.7.3.3.3 Baseline Wander Correction

The LXT972A PHY provides a baseline wander correction function for when the LXT972A PHY is under network operating conditions. The MLT3 coding scheme used in 100BASE-TX is by definition “unbalanced”. As a result, the average value of the signal voltage can “wander” significantly over short time intervals (tenths of seconds). This wander can cause receiver errors at long-line lengths (100 meters) in less robust designs. Exact characteristics of the wander are completely data dependent.

The LXT972A PHY baseline wander correction characteristics allow the device to recover error-free data while receiving worst-case packets over all cable lengths.

5.7.3.3.4 Programmable Slew Rate Control

The LXT972A PHY device supports a programmable slew-rate mechanism whereby one of four pre-selected slew rates can be used. (For details, see [Table 55, Transmit Control Register - Address 30, Hex 1E, on page 78.](#)) The slew-rate mechanism allows the designer to optimize the output waveform to match the characteristics of the magnetics.

Note: For hardware control of the slew rate, use the TxSLEW pins.

5.8 10 Mbps Operation

The LXT972A PHY operates as a standard 10BASE-T PHY and LXT972A PHY supports standard 10 Mbps functions. During 10BASE-T operation, the LXT972A PHY transmits and receives Xilinx* Manchester-encoded data across the network link. When the MAC is not actively transmitting data, the LXT972A PHY drives link pulses onto the line.

In 10BASE-T mode, the polynomial scrambler/de-scrambler is inactive. Manchester-encoded signals received from the network are decoded by the LXT972A PHY and sent across the MII to the MAC.

5.8.1 10BASE-T Preamble Handling

The LXT972A PHY offers two options for preamble handling, selected by register bit 16.5.

- In 10BASE-T mode when register bit 16.5 = 0, the LXT972A PHY strips the entire preamble off of received packets. CRS is asserted coincident with the start of the preamble. RX_DV is held Low for the duration of the preamble. When RX_DV is asserted, the very first two nibbles driven by the LXT972A PHY are the SFD "5D" hex followed by the body of the packet.
- In 10BASE-T mode when register bit 16.5 = 1, the LXT972A PHY passes the preamble through the MII and asserts RX_DV and CRS simultaneously. (In 10BASE-T loopback, the LXT972A PHY loops back whatever the MAC transmits to it, including the preamble.)

5.8.2 10BASE-T Carrier Sense

For 10BASE-T links, CRS assertion is based on reception of valid preamble, and CRS de-assertion is based on reception of an end-of-frame (EOF) marker. register bit 16.7 allows CRS de-assertion to be synchronized with RX_DV de-assertion. For details, see [Table 49, Configuration Register - Address 16, Hex 10, on page 71.](#)

5.8.3 10BASE-T Dribble Bits

The LXT972A PHY handles dribble bits in all modes. If one to four dribble bits are received, the nibble is passed across the MII, padded with ones if necessary. If five to seven dribble bits are received, the second nibble is not sent to the MII bus.

5.8.4 10BASE-T Link Integrity Test

In 10BASE-T mode, the LXT972A PHY always transmits link pulses.

- If the Link Integrity Test function is enabled (the normal configuration), the LXT972A PHY monitors the connection for link pulses. Once link pulses are detected, data transmission is enabled and remains enabled as long as either the link pulses or data transmission continue. If the link pulses stop, the data transmission is disabled.

- If the Link Integrity Test function is disabled (which can be done by setting Configuration register bit 16.14 to '1'), the LXT972A PHY transmits to the connection regardless of detected link pulses.

5.8.5 Link Failure

Link failure occurs if the Link Integrity Test is enabled and link pulses or packets stop being received. If this condition occurs, the LXT972A PHY returns to the auto-negotiation phase if auto-negotiation is enabled. If the Link Integrity Test function is disabled by setting Configuration register bit 16.14 to '1', the LXT972A PHY transmits packets, regardless of link status.

5.8.6 10BASE-T SQE (Heartbeat)

By default, the Signal Quality Error (SQE) or heartbeat function is disabled on the LXT972A PHY. To enable this function, set register bit 16.9 = 1. When this function is enabled, the LXT972A PHY asserts its COL output for 5 to 15 bit times (BT) after each packet. For SQE timing parameters, see [Figure 26, 10BASE-T SQE \(Heartbeat\) Timing, on page 58](#).

5.8.7 10BASE-T Jabber

If a transmission exceeds the jabber timer, the LXT972A PHY disables the transmit and loopback functions. For jabber timing parameters, see [Figure 25, 10BASE-T Jabber and Unjabber Timing, on page 58](#).

The LXT972A PHY automatically exits jabber mode after the unjabber time has expired. This function can be disabled by setting register bit 16.10 = 1.

5.8.8 10BASE-T Polarity Correction

The LXT972A PHY automatically detects and corrects for the condition in which the receive signal (TPIP/N) is inverted. Reversed polarity is detected if eight inverted link pulses, or four inverted end-of-frame (EOF) markers, are received consecutively. If link pulses or data are not received by the maximum receive time-out period (96 to 128 ms), the polarity state is reset to a non-inverted state.

When polarity reversal is detected in 10BASE-T operation, register 17.5 is set to 1. (For details, see bit 17.5 in [Table 50, Status Register #2 - Address 17, Hex 11, on page 72](#).)

5.9 Monitoring Operations

5.9.1 Monitoring Auto-Negotiation

Auto-negotiation can be monitored as follows:

- register bit 17.7 is set to '1' once the auto-negotiation process is completed.
- register bits 1.2 and 17.10 are set to '1' once the link is established.
- register bits 17.14 and 17.9 can be used to determine the link operating conditions (speed and duplex).

Note: When the LXT972A PHY detects incorrect polarity for a 10BASE-T operation, register bit 17.5 is set to '1'.

5.9.2 Monitoring Next Page Exchange

The LXT972A PHY offers an Alternate Next Page mode to simplify the next page exchange process. Normally, register bit 6.1 (Page Received) remains set until read. When Alternate Next Page mode is enabled, register bit 6.1 is automatically cleared whenever a new negotiation process takes place. This action prevents the user from reading an old value in bit 6.1 and assuming that Registers 5 and 8 (Partner Ability) contain valid information. Additionally, the LXT972A PHY uses register bit 6.5 to indicate when the current received page is the base page. This information is useful for recognizing when next pages must be resent due to a new negotiation process starting. register bits 6.1 and 6.5 are cleared when read.

5.9.3 LED Functions

The LXT972A PHY has these direct LED driver pins: LED1/CFG1, LED2/CFG2, and LED3/CFG3.

On power-up, all the drivers are asserted for approximately 1 second after reset de-asserts. Each LED driver can be programmed using the LED Configuration Register ([Table 53, LED Configuration Register - Address 20, Hex 14, on page 76](#)) to indicate one of the following conditions:

- Collision Condition
- Duplex Mode
- Link Status
- Operating Speed
- Receive Activity
- Transmit Activity

The LED drivers can also be programmed to display various combined status conditions. For example, setting register bits 20.15:12 to '1101' produces the following combination of Link and Activity indications:

- If Link is down, LED is off. If activity is detected from the MAC, the LED still blinks even if the link is down.
- If Link is up, LED is on.
- If Link is up and activity is detected, the LED blinks at the stretch interval selected by register bits 20.3:2 and continues to blink as long as activity is present.

The LXT972A PHY LED driver pins also provide initial configuration settings. The LED pins are sensitive to polarity and automatically pull up or pull down to configure for either open drain or open collector circuits (10 mA Max current rating) as required by the hardware configuration. For details, see the discussion of [Section 5.4.4, Hardware Configuration Settings, on page 28](#).

5.9.4 LED Pulse Stretching

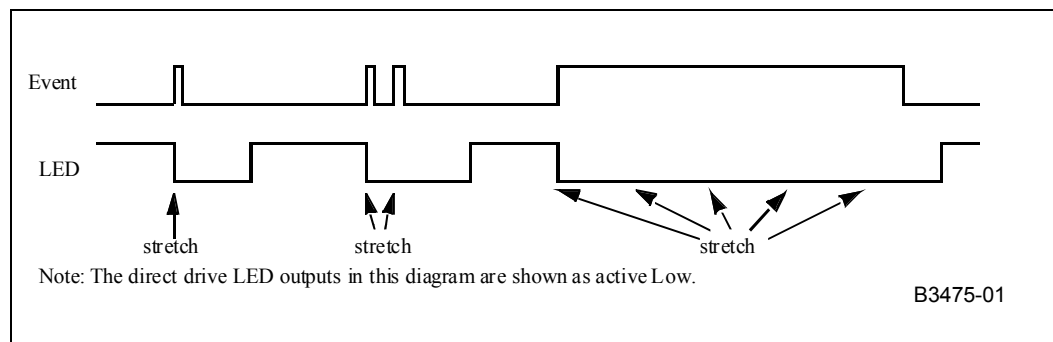

The LED Configuration Register also provides optional LED pulse stretching to 30, 60, or 100 ms. The pulse stretch time is extended further if the event occurs again during this pulse stretch period.

When an event such as receiving a packet occurs, the event is edge detected and it starts the stretch timer. The LED driver remains asserted until the stretch timer expires. If another event occurs before the stretch timer expires, then the stretch timer is reset and the stretch time is extended.

When a long event (such as duplex status) occurs, the event is edge detected and it starts the stretch timer. When the stretch timer expires, the edge detector is reset so that a long event causes another pulse to be generated from the edge detector, which resets the stretch timer and causes the LED driver to remain asserted.

Figure 18 shows how the stretch operation functions.

Figure 18 LED Pulse Stretching

5.10 Boundary Scan (JTAG 1149.1) Functions

The LXT972A PHY includes a IEEE 1149.1 boundary scan test port for board level testing. All digital input, output, and input/output pins are accessible.

Note: For the related BSDL file, contact your local sales office or access the Cortina website (www.cortina-systems.com).

5.10.1 Boundary Scan Interface

The boundary scan interface consists of five pins (TMS, TDI, TDO, TRST_L, and TCK). It includes a state machine, data register array, and instruction register. The TMS and TDI pins are pulled up internally. TCK is pulled down internally. TDO does not have an internal pull-up or pull-down.

5.10.2 State Machine

The TAP controller is a state machine, with 16 states driven by the TCK and TMS pins. Upon reset, the TEST_LOGIC_RESET state is entered. The state machine is also reset when TMS and TDI are high for five TCK periods.

5.10.3 Instruction Register

After the state machine resets, the IDCODE instruction is always invoked. The decode logic ensures the correct data flow to the Data registers according to the current instruction.

Table 16 lists valid LXT972A PHY JTAG instructions.

5.10.4 Boundary Scan Register

Each Boundary Scan Register (BSR) cell has two stages. A flip-flop and a latch are used for the serial shift stage and the parallel output stage. Table 16 lists the four BSR modes of operation.

Table 16 BSR Mode of Operation

| Mode | Description |
|------|-----------------|
| 1 | Capture |
| 2 | Shift |
| 3 | Update |
| 4 | System Function |

5.10.5 Device ID Register

Table 17 lists the bits for the Device ID register. For the current version of the JEDEC continuation characters, see the specification update for the LXT972A PHY.

Table 17 Device ID Register

| Bits 31:28 | Bits 27:12 | Bits 11:8 | Bits 7:1 | Bit 0 |
|---|---------------|-------------------------------|-----------------------|----------|
| Version | Part ID (Hex) | JEDEC Continuation Characters | JEDEC ID ¹ | Reserved |
| XXXX | 03CB | 0000 | 111 1110 | 1 |
| 1. The JEDEC ID is an 8-bit identifier. The MSB is for parity and is ignored. The JEDEC ID is FE (1111 1110), which becomes 111 1110. | | | | |

6.0 Application Information

6.1 Magnetics Information

The LXT972A PHY requires a 1:1 ratio for both the receive and transmit transformers. The transformer isolation voltage should be rated at 2 kV to protect the circuitry from static voltages across the connectors and cables. For transformer/magnetics requirements, see [Table 18](#).

Note: Before committing to a specific component, contact the manufacturer for current product specifications and validate the magnetics for the specific application.

Table 18 Magnetics Requirements

| Parameter | Min | Nom | Max | Units | Test Condition |
|---------------------------------------|-----|-------|-----|-------|----------------|
| Rx turns ratio | – | 1 : 1 | – | – | – |
| Tx turns ratio | – | 1 : 1 | – | – | – |
| Insertion loss | 0.0 | 0.6 | 1.1 | dB | – |
| Primary inductance | 350 | – | – | μH | – |
| Transformer isolation | – | 1.5 | – | kV | – |
| Differential to common mode rejection | 40 | – | – | dB | 0.1 to 60 MHz |
| | 35 | – | – | dB | 60 to 100 MHz |
| Return Loss | -16 | – | – | dB | 30 MHz |
| | -10 | – | – | dB | 80 MHz |

6.2 Typical Twisted-Pair Interface

[Table 19](#) provides a comparison of the RJ-45 connections for NIC and Switch applications in a typical twisted-pair interface setting.

Table 19 I/O Pin Comparison of NIC and Switch RJ-45 Setups

| Symbol | RJ-45 | |
|--------|--------|-----|
| | Switch | NIC |
| TPIP | 1 | 3 |
| TPIN | 2 | 6 |
| TPOP | 3 | 1 |
| TPON | 6 | 2 |

[Figure 19](#) shows the LXT972A PHY in a typical twisted-pair interface, with the RJ-45 connections crossed over for a Switch configuration.

Figure 19 Typical Twisted-Pair Interface - Switch

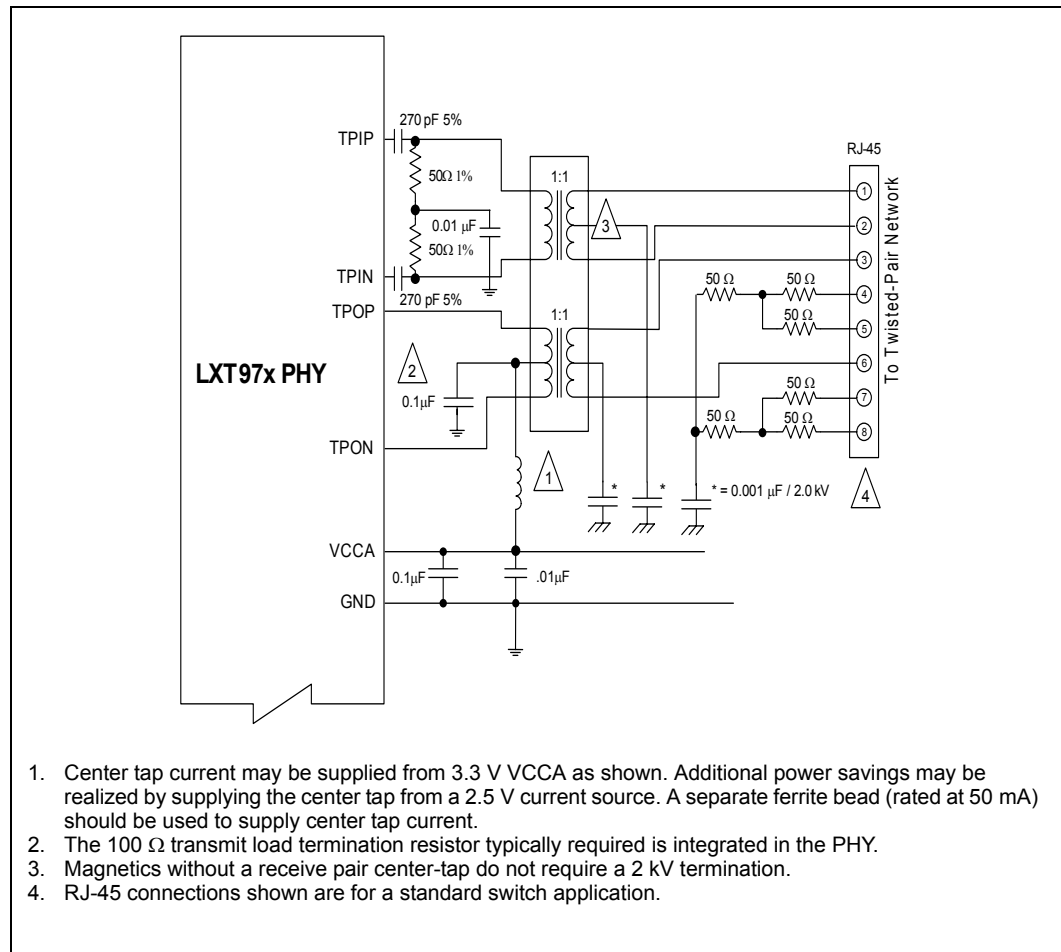

Figure 20 shows the LXT972A PHY in a typical twisted-pair interface, with the RJ-45 connections configured for a NIC application.

Figure 20 Typical Twisted-Pair Interface - NIC

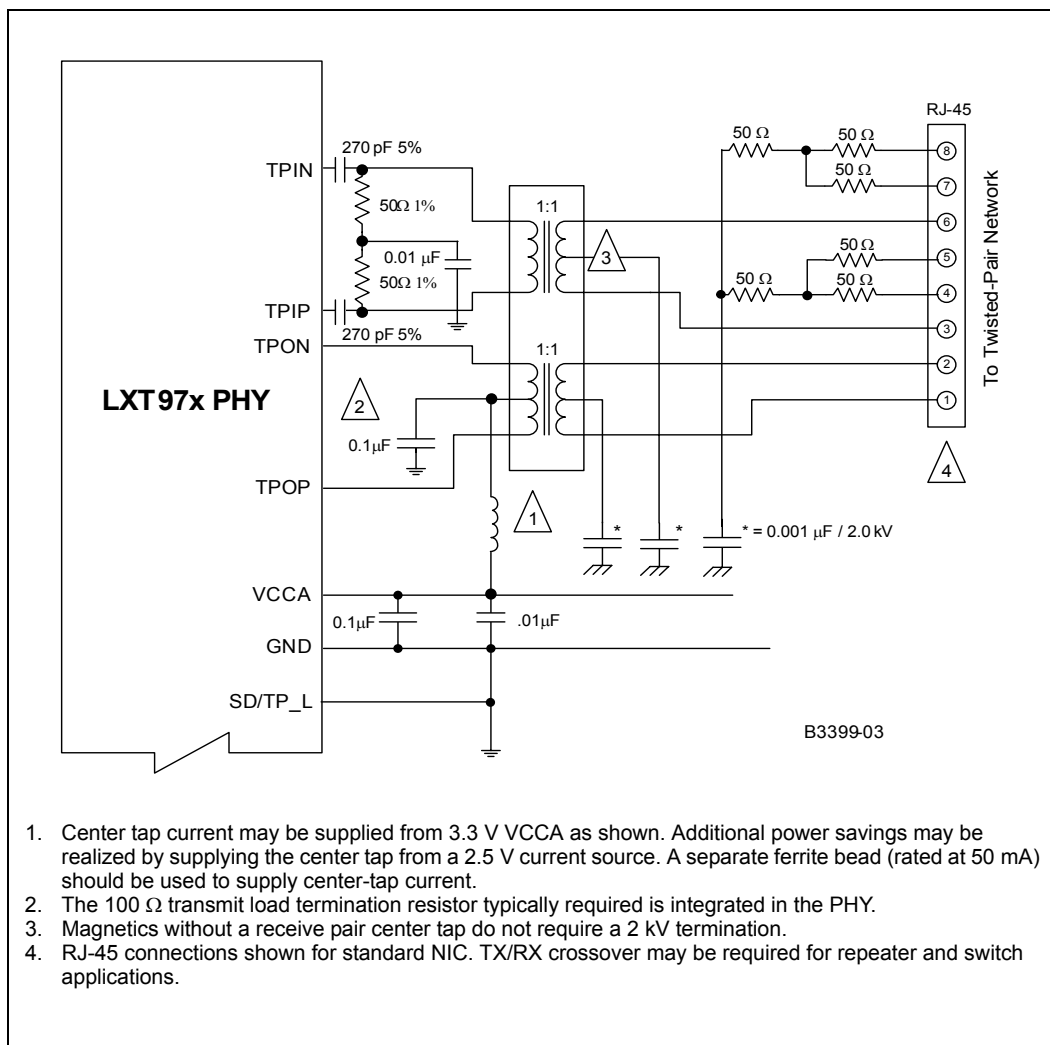

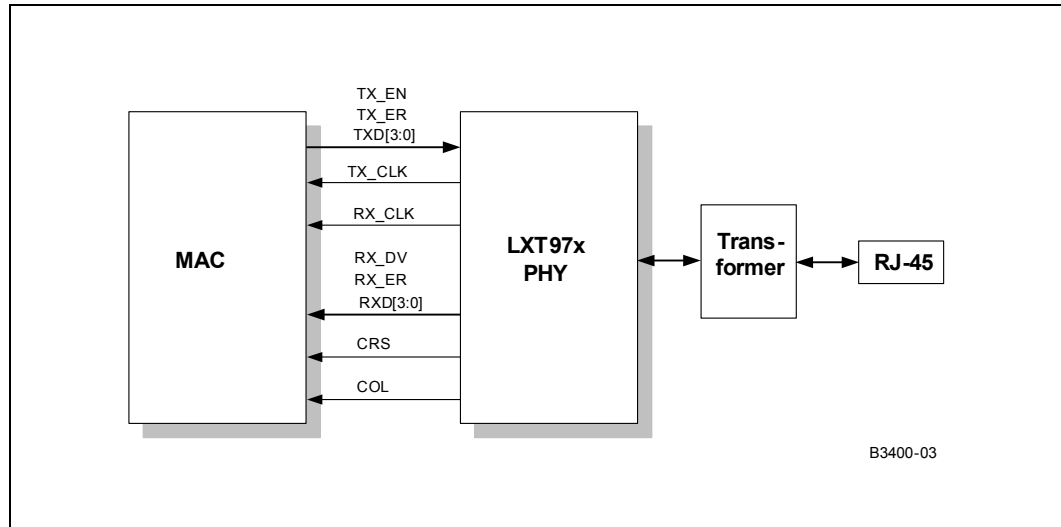

Figure 21 show a typical media independent interface (MII) for the LXT972A PHY.

Figure 21 Typical Media Independent Interface

7.0 Electrical Specifications

This chapter includes test specifications for the LXT972A PHY. These specifications are guaranteed by test except where noted “by design”.

Caution: Exceeding the absolute maximum rating values may cause permanent damage. Functional operation under these conditions is not implied. Exposure to maximum rating conditions for extended periods may affect device reliability.

7.1 DC Electrical Parameters

See the following DC specifications:

- Table 20, *Absolute Maximum Ratings*, on page 51
- Table 21, *Recommended Operating Conditions*, on page 51
- Table 22, *Digital I/O Characteristics (Except for MII, XI/XO, and LED/CFG Pins)*, on page 52
- Table 23, *Digital I/O Characteristics¹ - MII Pins*, on page 52
- Table 24, *I/O Characteristics - REFCLK/XI and XO Pins*, on page 53
- Table 25, *I/O Characteristics - LED/CFG Pins*, on page 53
- Table 26, *100BASE-TX PHY Characteristics*, on page 53
- Table 27, *10BASE-T PHY Characteristics*, on page 54
- Table 28, *10BASE-T Link Integrity Timing Characteristics*, on page 54
- Table 29, *Thermal Characteristics*, on page 54

Table 20 Absolute Maximum Ratings

| Parameter | Sym | Min | Max | Units |
|---------------------|-----|------|------|-------|
| Supply Voltage | VCC | -0.3 | 4.0 | V |
| Storage Temperature | TST | -65 | +150 | °C |

Table 21 Recommended Operating Conditions (Sheet 1 of 2)

| Parameter | Sym | Min | Typ ¹ | Max | Units |
|--|-------------------------------------|------|------------------|------|-------|
| Recommended operating temperature | T _{OPA} | 0 | – | 70 | °C |
| Recommended supply voltage ² - Analog and digital | V _{CCA} , V _{CCD} | 3.14 | 3.3 | 3.45 | V |
| Recommended supply voltage ² - I/O | V _{CCIO} | 2.35 | – | 3.45 | V |
| VCC current - 100 BASE-TX | I _{CC} | – | 92 | 110 | mA |
| VCC current - 10 BASE-T | I _{CC} | – | 66 | 82 | mA |

1. Typical values are at 25 °C and are for design aid only, not guaranteed, and not subject to production testing.
 2. Voltages are with respect to ground unless otherwise specified.

Table 21 Recommended Operating Conditions (Sheet 2 of 2)

| Parameter | Sym | Min | Typ ¹ | Max | Units |
|------------------|-----------------|-----|------------------|-----|-------|
| Hard Power Down | I _{CC} | – | – | 1 | mA |
| Soft Power Down | I _{CC} | – | 51 | – | mA |
| Auto-Negotiation | I _{CC} | – | 90 | 110 | mA |

1. Typical values are at 25 °C and are for design aid only, not guaranteed, and not subject to production testing.
 2. Voltages are with respect to ground unless otherwise specified.

| Parameter | Sym | Min | Typ ¹ | Max | Units | Test Conditions |
|---------------------|-----------------|-----|------------------|-----|-------|--|
| Input Low voltage | V _{IL} | – | – | 0.8 | V | – |
| Input High voltage | V _{IH} | 2.0 | – | – | V | – |
| Input current | I _I | -10 | – | 10 | μA | 0.0 < V _I < V _{CC} |
| Output Low voltage | V _{OL} | – | – | 0.4 | V | I _{OL} = 4 mA |
| Output High voltage | V _{OH} | 2.4 | – | – | V | I _{OH} = -4 mA |

1. Typical values are at 25 °C and are for design aid only, not guaranteed, and not subject to production testing.

Table 23 Digital I/O Characteristics¹ - MII Pins

| Parameter | Sym | Min | Typ ² | Max | Units | Test Conditions |
|--|----------------------------|-----|------------------|-----|-------|--|
| Input Low voltage | V _{IL} | – | – | 0.8 | V | – |
| Input High voltage | V _{IH} | 2.0 | – | – | V | – |
| Input current | I _I | -10 | – | 10 | μA | 0.0 < V _I < V _{CCIO} |
| Output Low voltage | V _{OL} | – | – | 0.4 | V | I _{OL} = 4 mA |
| Output High voltage | V _{OH} | 2.2 | – | – | V | I _{OH} = -4 mA, V _{CCIO} = 3.3 V |
| | V _{OH} | 2.0 | – | – | V | I _{OH} = -4 mA, V _{CCIO} = 2.5 V |
| Driver output resistance (Line driver output enabled) | R _{O³} | – | 100 | – | Ω | V _{CCIO} = 2.5 V |
| | R _{O³} | – | 100 | – | Ω | V _{CCIO} = 3.3 V |

1. MII digital I/O pins are tolerant to 5 V inputs.
 2. Typical values are at 25 °C and are for design aid only, not guaranteed, and not subject to production testing.
 3. Parameter is guaranteed by design and not subject to production testing.

Table 24 I/O Characteristics - REFCLK/XI and XO Pins

| Parameter | Symbol | Min | Typ ¹ | Max | Units | Test Conditions |
|--|-----------------|-----|------------------|------|-------|-----------------|
| Input Low Voltage | V _{IL} | – | – | 0.8 | V | – |
| Input High Voltage | V _{IH} | 2.0 | – | – | V | – |
| Input Clock Frequency Tolerance ² | Δf | – | – | ±100 | ppm | – |
| Input Clock Duty Cycle ² | T _{dc} | 35 | – | 65 | % | – |
| Input Capacitance | C _{IN} | – | 3.0 | – | pF | – |

1. Typical values are at 25 °C and are for design aid only, not guaranteed, and not subject to production testing.
 2. Parameter is guaranteed by design and not subject to production testing.

Table 25 I/O Characteristics - LED/CFG Pins

| Parameter | Symbol | Min | Typ | Max | Units | Test Conditions |

Figure 22 100BASE-TX Receive Timing

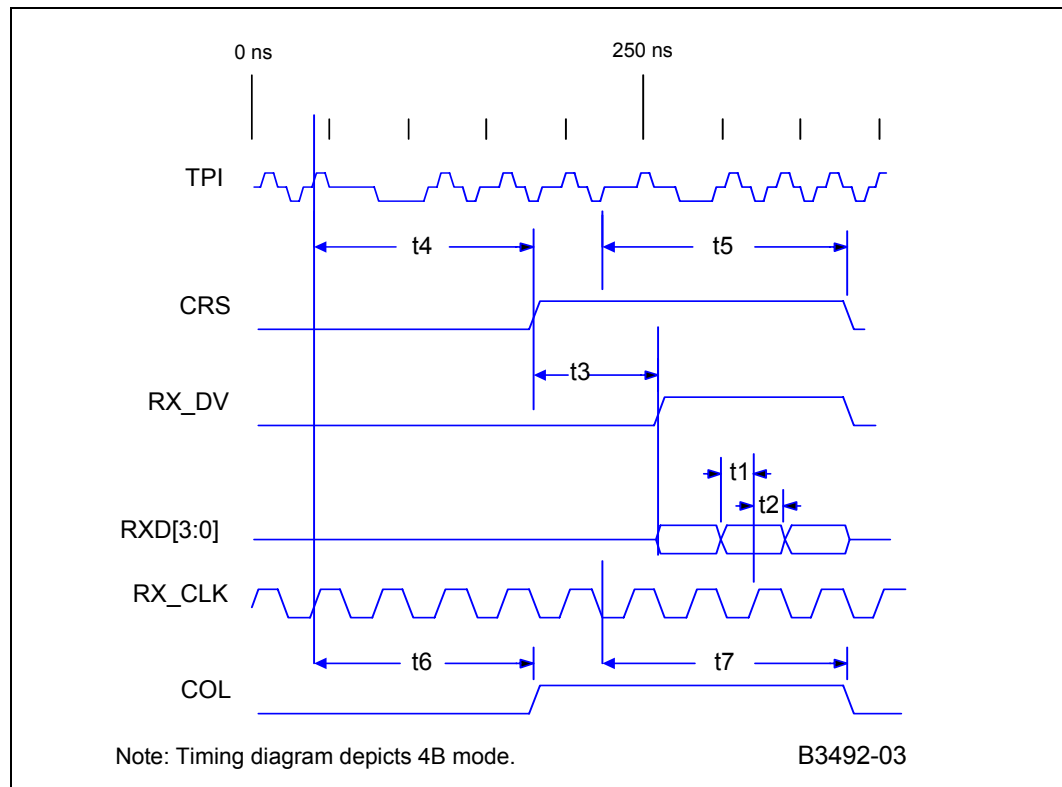

Table 30 100BASE-TX Receive Timing Parameters - 4B Mode

| Parameter | Sym | Min | Typ ¹ | Max | Units ² | Test Conditions |
|--|-----|-----|------------------|-----|--------------------|-----------------|
| RXD[3:0], RX_DV, RX_ER ³ setup to RX_CLK High | t1 | 10 | – | – | ns | – |
| RXD[3:0], RX_DV, RX_ER hold from RX_CLK High | t2 | 10 | – | – | ns | – |
| CRS asserted to RXD[3:0], RX_DV | t3 | 3 | – | 5 | BT | – |
| Receive start of “J” to CRS asserted | t4 | 12 | – | 16 | BT | – |
| Receive start of “T” to CRS de-asserted | t5 | 10 | – | 17 | BT | – |
| Receive start of “J” to COL asserted | t6 | 16 | – | 22 | BT | – |
| Receive start of “T” to COL de-asserted | t7 | 17 | – | 20 | BT | – |

1. Typical values are at 25 °C and are for design aid only, not guaranteed, and not subject to production testing.
 2. BT (Bit Time) is the duration of one bit as transferred to and from the Mac and is the reciprocal of the bit rate. 100BASE-T bit time = 10⁻⁸ s or 10 ns.
 3. RX_ER is not shown in the figure.

Figure 23 100BASE-TX Transmit Timing

Table 31 10BASE-T Receive Timing Parameters

| Parameter | Sym | Min | Typ ¹ | Max | Units ² | Test Conditions |
|--|-----|-----|------------------|-----|--------------------|-----------------|
| RXD, RX_DV, RX_ER Setup to RX_CLK High | t1 | 10 | – | – | ns | – |
| RXD, RX_DV, RX_ER Hold from RX_CLK High | t2 | 10 | – | – | ns | – |
| TPIP/N in to RXD out (Rx latency) | t3 | 4.2 | – | 6.6 | BT | – |
| CRS asserted to RXD, RX_DV, RX_ER asserted | t4 | 5 | – | 32 | BT | – |
| RXD, RX_DV, RX_ER de-asserted to CRS de-asserted | t5 | 0.3 | – | 0.5 | BT | – |
| TPI in to CRS asserted | t6 | 2 | – | 28 | BT | – |
| TPI quiet to CRS de-asserted | t7 | 6 | – | 10 | BT | – |
| TPI in to COL asserted | t8 | 1 | – | 31 | BT | – |
| TPI quiet to COL de-asserted | t9 | 5 | – | 10 | BT | – |

1. Typical values are at 25 °C and are for design aid only, not guaranteed, and not subject to production testing.
 2. BT (Bit Time) is the duration of one bit as transferred to and from the MAC and is the reciprocal of the bit rate. 10BASE-T bit time = 10⁻⁷ s or 100 ns.

Figure 24 10BASE-T Transmit Timing

Figure 25 10BASE-T Jabber and Unjabber Timing

Table 32 10BASE-T Jabber and Unjabber Timing

| Parameter | Symbol | Min | Typ ¹ | Max | Units | Test Conditions |
|-----------------------|--------|-----|------------------|-----|-------|-----------------|
| Maximum transmit time | t1 | 20 | – | 150 | ms | – |
| Unjabber time | t2 | 250 | – | 750 | ms | – |

1. Typical values are at 25 °C and are for design aid only, not guaranteed, and not subject to production testing.

Figure 26 10BASE-T SQE (Heartbeat) Timing

Table 33 PHY 10BASE-T SQE (Heartbeat) Timing

| Parameter | Symbol | Min | Typ ¹ | Max | Units | Test Conditions |
|---------------------------------|--------|------|------------------|-----|-------|-----------------|
| COL (SQE) Delay after TX_EN off | t1 | 0.65 | – | 1.6 | us | – |
| COL (SQE) Pulse duration | t2 | 0.5 | – | 1.5 | us | – |

1. Typical values are at 25 °C and are for design aid only, not guaranteed, and not subject to production testing.

Figure 27 Auto-Negotiation and Fast Link Pulse Timing

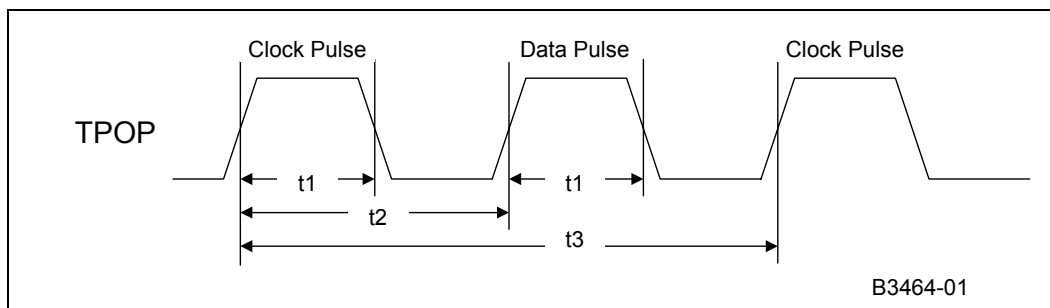

Figure 28 Fast Link Pulse Timing

Table 34 Auto-Negotiation and Fast Link Pulse Timing Parameters

| Parameter | Symbol | Min | Typ ¹ | Max | Units | Test Conditions |
|-----------------------------|--------|------|------------------|------|--------------------------------|-----------------|
| Clock/Data pulse width | t1 | – | 100 | – | ns | – |
| Clock pulse to Data pulse | t2 | 55.5 | – | 63.8 | μs | – |
| Clock pulse to Clock pulse | t3 | 123 | – | 127 | μs | – |
| FLP burst width | t4 | – | 2 | – | ms | – |
| FLP burst to FLP burst | t5 | 8 | 12 | 24 | ms | – |
| Clock/Data pulses per burst | – | 17 | – | 33 | Each clock pulse or data pulse | – |

1. Typical values are at 25 °C and are for design aid only, not guaranteed, and not subject to production testing.

Figure 29 MDIO Input Timing

Figure 30 MDIO Output Timing

Table 35 MDIO Timing

| Parameter | Symbol | Min | Typ ¹ | Max | Units | Test Conditions |
|--|--------|-----|------------------|-----|-------|-----------------|
| MDIO setup before MDC, sourced by STA | t1 | 10 | – | – | ns | – |
| MDIO hold after MDC, sourced by STA | t2 | 5 | – | – | ns | – |
| MDC to MDIO output delay, sourced by PHY | t3 | – | – | 150 | ns | – |
| MDC period | t4 | 125 | – | – | ns | MDC = 8 MHz |

1. Typical values are at 25° C and are for design aid only, not guaranteed, and not subject to production testing.

Figure 31 Power-Up Timing

Table 36 Power-Up Timing

| Parameter | Symbol | Min | Typ ¹ | Max | Units | Test Conditions |
|-----------------------------|--------|-----|------------------|-----|-------|-----------------|
| Voltage threshold | v1 | – | 2.9 | – | V | – |
| Power Up delay ² | t1 | – | – | 300 | μs | – |

1. Typical values are at 25° C and are for design aid only, not guaranteed, and not subject to production testing.
 2. Power-up delay is specified as a maximum value because it refers to the PHY guaranteed performance. The PHY comes out of reset after a delay of no more than 300 μs. System designers should consider this value as a minimum value. After threshold v1 is reached, the MAC should delay no less than 300 μs before accessing the MDIO port.

Figure 32 RESET_L Pulse Width and Recovery Timing

Table 37 **RESET_L Pulse Width and Recovery Timing**

| Parameter | Symbol | Min | Typ ¹ | Max | Units | Test Conditions |
|--|--------|-----|------------------|-----|-------|-----------------|
| RESET_L pulse width | t1 | 10 | – | – | ns | – |
| RESET_L recovery delay ² | t2 | – | | 300 | μs | – |
| 1. Typical values are at 25° C and are for design aid only, not guaranteed, and not subject to production testing. 2. Reset Recovery Delay is specified as a maximum value because it refers to the PHY guaranteed performance. The PHY comes out of reset after a delay of no more than 300 μs. System designers should consider this value as a minimum value. After de-asserting RESET_L, the MAC should delay no less than 300 μs before accessing the MDIO port. | | | | | | |

8.0 Register Definitions - IEEE Base Registers

This chapter includes definitions for the IEEE base registers used by the LXT972A PHY. [Section 9.0, Register Definitions - Product-Specific Registers](#) includes definitions of additional product-specific LXT972A PHY registers, which are defined in accordance with the IEEE 802.3 standard for adding unique device functions.

The LXT972A PHY register set has multiple 16-bit registers.

- [Table 38](#) is a register set listing of the IEEE base registers.
- [Table 39](#) through [Table 47](#) provide bit descriptions of the base registers (address 0 through 8), which are defined in accordance with the “Reconciliation Sublayer and Media Independent Interface” and “Physical Layer Link Signaling for 10/100 Mbps Auto-Negotiation” sections of the IEEE 802.3 standard.

Table 38 Register Set for IEEE Base Registers

| Address | Register Name | Bit Assignments |
|----------|--|---|
| 0 | Control Register | See Table 39 on page 64 |
| 1 | Status Register #1 | See Table 40 on page 65 |
| 2 | PHY Identification Register 1 | See Table 41 on page 66 |
| 3 | PHY Identification Register 2 | See Table 42 on page 66 |
| 4 | Auto-Negotiation Advertisement Register | See Table 43 on page 67 |
| 5 | Auto-Negotiation Link Partner Base Page Ability Register | See Table 44 on page 68 |
| 6 | Auto-Negotiation Expansion Register | See Table 45 on page 69 |
| 7 | Auto-Negotiation Next Page Transmit Register | See Table 46 on page 69 |
| 8 | Auto-Negotiation Link Partner Next Page Receive Register | See Table 47 on page 70 |
| 9 | 1000BASE-T/100BASE-T2 Control Register | Not Implemented |
| 10 | 1000BASE-T/100BASE-T2 Status Register | Not Implemented |
| 11 to 14 | Reserved | Not Implemented |
| 15 | Extended Status Register | Not Implemented |

Table 39 Control Register - Address 0, Hex 0

| Bit | Name | Description | | | Type ¹ | Default |
|-------|--------------------------|---|------|---------------------------|-------------------|---------|
| 0.15 | Reset | 0 = Normal operation 1 = PHY reset | | | R/W SC | 0 |
| 0.14 | Loopback | 0 = Disable loopback mode 1 = Enable loopback mode | | | R/W | 0 |
| 0.13 | Speed Selection | 0.6 | 0.13 | Speed Selected | R/W | Note 2 |
| | | 0 | 0 | 10 Mbps | | |
| | | 0 | 1 | 100 Mbps | | |
| | | 1 | 0 | 1000 Mbps (not supported) | | |
| 1 | 1 | Reserved | | | | |
| 0.12 | Auto-Negotiation Enable | 0 = Disable auto-negotiation process 1 = Enable auto-negotiation process | | | R/W | Note 2 |
| 0.11 | Power-Down | 0 = Normal operation 1 = Power-down | | | R/W | 0 |
| 0.10 | Isolate | 0 = Normal operation 1 = Electrically isolate PHY from MII | | | R/W | 0 |
| 0.9 | Restart Auto-Negotiation | 0 = Normal operation 1 = Restart auto-negotiation process | | | R/W SC | 0 |
| 0.8 | Duplex Mode | 0 = Half-duplex 1 = Full-duplex | | | R/W | Note 2 |
| 0.7 | Collision Test | 0 = Disable COL signal test 1 = Enable COL signal test | | | R/W | 0 |
| 0.6 | Speed Selection | 0.6 | 0.13 | Speed Selected | R/W | 0 |
| | | 0 | 0 | 10 Mbps | | |
| | | 0 | 1 | 100 Mbps | | |
| | | 1 | 0 | 1000 Mbps (not supported) | | |
| 1 | 1 | Reserved | | | | |
| 0.5:0 | Reserved | Write as '0'. Ignore on Read. | | | R/W | 00000 |

1. R/W = Read/Write
 SC = Self Clearing
 2. Some bits have their default values determined at reset by hardware configuration pins. For default details for these bits, see [Section 5.4.4, Hardware Configuration Settings](#).

Table 40 MII Status Register #1 - Address 1, Hex 1

| Bit | Name | Description | Type ¹ | Default |
|--|---|--|-------------------|---------|
| 1.15 | 100BASE-T4 Not Supported | 0 = PHY not able to perform 100BASE-T4 1 = PHY able to perform 100BASE-T4 | RO | 0 |
| 1.14 | 100BASE-X Full-Duplex | 0 = PHY not able to perform full-duplex 100BASE-X 1 = PHY able to perform full-duplex 100BASE-X | RO | 1 |
| 1.13 | 100BASE-X Half-Duplex | 0 = PHY not able to perform half-duplex 100BASE-X 1 = PHY able to perform half-duplex 100BASE-X | RO | 1 |
| 1.12 | 10 Mbps Full-Duplex | 0 = PHY not able to operate at 10 Mbps full-duplex mode 1 = PHY able to operate at 10 Mbps in full-duplex mode | RO | 1 |
| 1.11 | 10 Mbps Half-Duplex | 0 = PHY not able to operate at 10 Mbps in half-duplex mode 1 = PHY able to operate at 10 Mbps in half-duplex mode | RO | 1 |
| 1.10 | 100BASE-T2 Full-Duplex Not Supported | 0 = PHY not able to perform full-duplex 100BASE-T2 1 = PHY able to perform full-duplex 100BASE-T2 | RO | 0 |
| 1.9 | 100BASE-T2 Half-Duplex Not Supported | 0 = PHY not able to perform half-duplex 100BASE-T2 1 = PHY able to perform half-duplex 100BASE-T2 | RO | 0 |
| 1.8 | Extended Status | 0 = No extended status information in register 15 1 = Extended status information in register 15 | RO | 0 |
| 1.7 | Reserved | Ignore when read. | RO | 0 |
| 1.6 | MF Preamble Suppression | 0 = PHY cannot accept management frames with preamble suppressed 1 = PHY accepts management frames with preamble suppressed | RO | 0 |
| 1.5 | Auto-Negotiation complete | 0 = Auto-negotiation not complete 1 = Auto-negotiation complete | RO | 0 |
| 1.4 | Remote Fault | 0 = No remote fault condition detected 1 = Remote fault condition detected | RO/LH | 0 |
| 1.3 | Auto-Negotiation Ability | 0 = PHY is not able to perform auto-negotiation 1 = PHY is able to perform auto-negotiation | RO | 1 |
| 1.2 | Link Status | 0 = Link is down 1 = Link is up | RO/LL | 0 |
| 1.1 | Jabber Detect | 0 = Jabber condition not detected 1 = Jabber condition detected | RO/LH | 0 |
| 1.0 | Extended Capability | 0 = Basic register capabilities 1 = Extended register capabilities | RO | 1 |
| 1. RO = Read Only LL = Latching Low LH = Latching High | | | | |

Table 41 PHY Identification Register 1 - Address 2, Hex 2

| Bit | Name | Description | Type ¹ | Default |
|--|---------------|--|-------------------|----------|
| Note: See Figure 33 for identifier bit mapping. | | | | |
| 2.15:0 | PHY ID Number | The PHY identifier is composed of bits 3 through 18 of the Organizationally Unique Identifier (OUI). | RO | 0013 hex |
| 1. RO = Read Only | | | | |

Table 42 PHY Identification Register 2 - Address 3, Hex 3

| Bit | Name | Description | Type ¹ | Default |
|--|--------------------------------|--|-------------------|--|
| Note: See Figure 33 for identifier bit mapping. | | | | |
| 3.15:10 | PHY ID number | The PHY identifier is composed of bits 19 through 24 of the OUI. | RO | 011110 |
| 3.9:4 | Manufacturer's model number | 6 bits containing manufacturer's part number. | RO | 001110 |
| 3.3:0 | Manufacturer's revision number | 4 bits containing manufacturer's revision number. | RO | For current revision ID information, see the Specification Update. |
| 1. RO = Read Only | | | | |

Figure 33 PHY Identifier Bit Mapping

| 5.6 | 10BASE-T Full-Duplex | 0 = Link Partner is not 10BASE-T full-duplex capable. 1 = Link Partner is 10BASE-T full-duplex capable. | RO | 0 |
| 5.5 | 10BASE-T | 0 = Link Partner is not 10BASE-T capable. 1 = Link Partner is 10BASE-T capable. | RO | 0 |
| 5.4:0 | Selector Field S<4:0> | <00001> = IEEE 802.3. <00010> = IEEE 802.9 ISLAN-16T. <00000> = Reserved for future auto-negotiation development. <11111> = Reserved for future auto-negotiation development. Unspecified or reserved combinations must not be transmitted. | RO | 0 |

1. RO = Read Only

Table 45 Auto-Negotiation Expansion - Address 6, Hex 6

| Bit | Name | Description | Type ¹ | Default |
|--------|-----------------------------|--|-------------------|---------|
| 6.15:6 | Reserved | Ignore when read. | RO | 0 |
| 6.5 | Base Page | This bit indicates the status of the auto-negotiation variable base page. It flags synchronization with the auto-negotiation state diagram, allowing detection of interrupted links. This bit is used only if register bit 16.1 (that is, Alternate NP feature) is set. 0 = Base page = False (base page not received) 1 = Base page = True (base page received) | RO/LH | 0 |
| 6.4 | Parallel Detection Fault | 0 = Parallel detection fault has not occurred. 1 = Parallel detection fault has occurred. | RO/LH | 0 |
| 6.3 | Link Partner Next Page Able | 0 = Link partner is not next page able. 1 = Link partner is next page able. | RO | 0 |
| 6.2 | Next Page Able | 0 = Local device is not next page able. 1 = Local device is next page able. | RO | 1 |
| 6.1 | Page Received | This bit is cleared on Read. If register bit 16.1 is set, the Page Received bit is also cleared when either mr_page_rx = false or transmit_disable = true. 1 = Indicates a new page is received and the received code word is loaded into Register 5 (Base Pages) or Register 8 (Next Pages) as specified in Clause 28 of IEEE 802.3. | RO/LH | 0 |
| 6.0 | Link Partner A/N Able | 0 = Link partner is not auto-negotiation able. 1 = Link partner is auto-negotiation able. | RO | 0 |

1. RO = Read Only LH = Latching High

Table 46 Auto-Negotiation Next Page Transmit Register - Address 7, Hex 7

| Bit | Name | Description | Type ¹ | Default |
|--------|---------------------------------|---|-------------------|---------------------|
| 7.15 | Next Page (NP) | 0 = Last page 1 = Additional next pages follow | R/W | 0 |
| 7.14 | Reserved | Ignore when read. | RO | 0 |
| 7.13 | Message Page (MP) | 0 = register bits 7.10:0 are user defined. 1 = register bits 7.10:0 follow IEEE message page format. | R/W | 1 |
| 7.12 | Acknowledge 2 (ACK2) | 0 = Cannot comply with message 1 = Complies with message | R/W | 0 |
| 7.11 | Toggle (T) | 0 = Previous value of the transmitted Link Code Word equalled logic one 1 = Previous value of the transmitted Link Code Word equalled logic zero | R/W | 0 |
| 7.10:0 | Message/ Unformatted Code Field | If register bits 7.13 = 0, register bits 7.10:0 are user-defined. If register bits 7.13 = 1, register bits 7.10:0 follow IEEE message page format. | R/W | 0000 0000 001 |

1. RO = Read Only. R/W = Read/Write

Table 47 Auto-Negotiation Link Partner Next Page Receive Register - Address 8, Hex 8

| Bit | Name | Description | Type ¹ | Default |
|--------|---------------------------------------|---|-------------------|--------------------|
| 8.15 | Next Page (NP) | 0 = Link Partner has no additional next pages to send 1 = Link Partner has additional next pages to send | RO | 0 |
| 8.14 | Acknowledge (ACK) | 0 = Link Partner has not received Link Code Word from LXT972A PHY. 1 = Link Partner has received Link Code Word from LXT972A PHY. | RO | 0 |
| 8.13 | Message Page (MP) | 0 = register bits 8.10:0 are user defined. 1 = register bits 8.10:0 follow IEEE message page format. | RO | 0 |
| 8.12 | Acknowledge 2 (ACK2) | 0 = Link Partner cannot comply with the message 1 = Link Partner complies with the message | RO | 0 |
| 8.11 | Toggle (T) | 0 = Previous value of transmitted Link Code Word equal to logic one 1 = Previous value of transmitted Link Code Word equal to logic zero | RO | 0 |
| 8.10:0 | Message/ Unformatted Code Field | If register bit 8.13 = 0, register bits 18.10:0 are user defined. If register bit 8.13 = 1, register bits 18.10:0 follow IEEE message page format. | RO | 0000 0000 00 |

1. RO = Read Only.

9.0 Register Definitions - Product-Specific Registers

This chapter includes definitions of product-specific LXT972A PHY registers that are defined in accordance with the IEEE 802.3 standard for adding unique device functions. (For definitions of the IEEE base registers used by the LXT972A PHY, see [Section 8.0, Register Definitions - IEEE Base Registers](#).)

- [Table 48](#) lists the register set of the product-specific registers.
- [Table 49](#) through [Table 55](#) provide bit descriptions of the product-specific registers (address 17 through 30).

Table 48 Register Set for Product-Specific Registers

| Address | Register Name | Bit Assignments |
|---------|--------------------------------|------------------------------|
| 16 | Port Configuration Register | See Table 49 |
| 17 | Status Register #2 | See Table 50 |
| 18 | Interrupt Enable Register | See Table 51 |
| 19 | Status Change Register | See Table 52 |
| 20 | LED Configuration Register | See Table 53 |
| 21 | Reserved | — |
| 22-25 | Reserved | — |
| 26 | Digital Configuration Register | See Table 54 |
| 27 | Reserved | — |
| 28 | Reserved | — |
| 29 | Reserved | — |
| 30 | Transmit Control Register | See Table 55 |
| 31 | Reserved | — |

Table 49 Configuration Register - Address 16, Hex 10 (Sheet 1 of 2)

| Bit | Name | Description | Type ¹ | Default |
|-------|-------------------------------|--|-------------------|---------|
| 16.15 | Reserved | Write as '0'. Ignore on Read. | R/W | 0 |
| 16.14 | Force Link Pass | 0 = Normal operation 1 = Force Link pass | R/W | 0 |
| 16.13 | Transmit Disable | 0 = Normal operation 1 = Disable Twisted Pair transmitter | R/W | 0 |
| 16.12 | Bypass Scrambler (100BASE-TX) | 0 = Normal operation 1 = Bypass Scrambler and Descrambler | R/W | 0 |
| 16.11 | Reserved | Write as '0'. Ignore on Read. | R/W | 0 |
| 16.10 | Jabber (10BASE-T) | 0 = Normal operation 1 = Disable Jabber Correction | R/W | 0 |
| 16.9 | SQE (10BASE-T) | 0 = Disable Heart Beat 1 = Enable Heart Beat | R/W | 0 |

1. R/W = Read /Write

Table 49 Configuration Register - Address 16, Hex 10 (Sheet 2 of 2)

| Bit | Name | Description | Type ¹ | Default |
|--------|------------------------|---|-------------------|---------|
| 16.8 | TP Loopback (10BASE-T) | 0 = Normal operation 1 = Disable TP loopback during half-duplex operation | R/W | 0 |
| 16.7 | CRS Select (10BASE-T) | 0 = Normal Operation 1 = CRS deassert extends to RX_DV deassert | R/W | 1 |
| 16.6 | Reserved | Write as '0'. Ignore on Read. | R/W | 0 |
| 16.5 | PRE_EN | Preamble Enable. 0 = Set RX_DV high coincident with SFD. 1 = Set RX_DV high and RXD = preamble when CRS is asserted. Note: Preamble is always enabled in 100 Mbps operation. | R/W | 0 |
| 16.4:3 | Reserved | Write as '0'. Ignore on Read. | R/W | 00 |
| 16.2 | Reserved | Write as '0'. Ignore on Read. | R/W | 0 |
| 16.1 | Alternate NP feature | 0 = Disable alternate auto negotiate next page feature. 1 = Enable alternate auto negotiate next page feature. Note: This bit enables or disables the register bit 6.5 capability. | R/W | 0 |
| 16.0 | Reserved | Write as '0'. Ignore on Read. | R/W | 0 |

1. R/W = Read /Write

Table 50 Status Register #2 - Address 17, Hex 11 (Sheet 1 of 2)

| Bit | Name | Description | Type ¹ | Default |
|-------|------------------|---|-------------------|---------|
| 17.15 | Reserved | Always 0. | RO | 0 |
| 17.14 | 10/100 Mode | 0 = LXT972A PHY is not operating 100BASE-TX mode. 1 = LXT972A PHY is operating in 100BASE-TX mode. | RO | 0 |
| 17.13 | Transmit Status | 0 = LXT972A PHY is not transmitting a packet. 1 = LXT972A PHY is transmitting a packet. | RO | 0 |
| 17.12 | Receive Status | 0 = LXT972A PHY is not receiving a packet. 1 = LXT972A PHY is receiving a packet. | RO | 0 |
| 17.11 | Collision Status | 0 = No collision. 1 = Collision is occurring. | RO | 0 |
| 17.10 | Link | 0 = Link is down. 1 = Link is up. | RO | 0 |
| 17.9 | Duplex Mode | 0 = Half-duplex. 1 = Full-duplex. | RO | 0 |
| 17.8 | Auto-Negotiation | 0 = LXT972A PHY is in manual mode. 1 = LXT972A PHY is in auto-negotiation mode. | RO | 0 |

1. RO = Read Only. R/W = Read/Write

Table 50 Status Register #2 - Address 17, Hex 11 (Sheet 2 of 2)

| Bit | Name | Description | Type ¹ | Default |
|-------------------------------------|---------------------------|--|-------------------|---------|
| 17.7 | Auto-Negotiation Complete | 0 = Auto-negotiation process not completed. 1 = Auto-negotiation process completed. This bit is valid only when auto negotiate is enabled. The value is equivalent to the value of register bit 1.5. | RO | 0 |
| 17.6 | Reserved | Always 0. | RO | 0 |
| 17.5 | Polarity | 0 = Polarity is not reversed. 1 = Polarity is reversed. Note: Polarity is not a valid status in 100 Mbps mode. | RO | 0 |
| 17.4 | Pause | 0 = The LXT972A PHY is not Pause capable. 1 = The LXT972A PHY is Pause capable. | R | 0 |
| 17:3 | Error | 0 = No error occurred 1 = Error occurred (Remote Fault, jabber, parallel detect fault) Note: The register bit is cleared when the registers that generate the error condition are read. | RO | 0 |
| 17:2 | Reserved | Always 0. | RO | 0 |
| 17:1 | Reserved | Always 0. | RO | 0 |
| 17.0 | Reserved | Always 0. | RO | 0 |
| 1. RO = Read Only. R/W = Read/Write | | | | |

Table 51 Interrupt Enable Register - Address 18, Hex 12

| Bit | Name | Description | Type ¹ | Default |
|---------|-----------|--|-------------------|---------|
| 18.15:9 | Reserved | Write as '0'. Ignore on Read. | R/W | N/A |
| 18.8 | Reserved | Write as '0'. Ignore on Read. | R/W | 0 |
| 18.7 | ANMSK | Mask for Auto Negotiate Complete 0 = Do not allow event to cause interrupt. 1 = Enable event to cause interrupt. | R/W | 0 |
| 18.6 | SPEEDMSK | Mask for Speed Interrupt 0 = Do not allow event to cause interrupt. 1 = Enable event to cause interrupt. | R/W | 0 |
| 18.5 | DUPLEXMSK | Mask for Duplex Interrupt 0 = Do not allow event to cause interrupt. 1 = Enable event to cause interrupt. | R/W | 0 |
| 18.4 | LINKMSK | Mask for Link Status Interrupt 0 = Do not allow event to cause interrupt. 1 = Enable event to cause interrupt. | R/W | 0 |
| 18.3 | Reserved | Write as '0'. Ignore on Read. | R/W | 0 |
| 18.2 | Reserved | Write as '0'. Ignore on Read. | R/W | 0 |
| 18.1 | INTEN | Interrupt Enable. 0 = Disable interrupts. 1 = Enable interrupts. | R/W | 0 |
| 18.0 | TINT | Test Force Interrupt 0 = Normal operation. 1 = Force interrupt on MDINT_L | R/W | 0 |

1. R/W = Read /Write

Table 52 Status Change Register - Address 19, Hex 13 (Sheet 1 of 2)

| Bit | Name | Description | Type ¹ | Default |
|---------|-----------|--|-------------------|---------|
| 19.15:9 | Reserved | Ignore on Read. | RO | N/A |
| 19.8 | Reserved | Ignore on Read. | RO | 0 |
| 19.7 | ANDONE | Auto-negotiation Status 0 = Auto-negotiation has not completed. 1 = Auto-negotiation has completed. | RO/ SC | N/A |
| 19.6 | SPEEDCHG | Speed Change Status 0 = A Speed Change has not occurred since last reading this register. 1 = A Speed Change has occurred since last reading this register. | RO/ SC | 0 |
| 19.5 | DUPLEXCHG | Duplex Change Status 0 = A Duplex Change has not occurred since last reading this register. 1 = A Duplex Change has occurred since last reading this register. | RO/ SC | 0 |

1. R/W = Read/Write, RO = Read Only, SC = Self Clearing.

Table 52 Status Change Register - Address 19, Hex 13 (Sheet 2 of 2)

| Bit | Name | Description | Type ¹ | Default |
|--|----------|---|-------------------|---------|
| 19.4 | LINKCHG | Link Status Change Status 0 = A Link Change has not occurred since last reading this register. 1 = A Link Change has occurred since last reading this register. | RO/ SC | 0 |
| 19.3 | Reserved | Ignore on Read. | RO | 0 |
| 19.2 | MDINT_L | 0 = Management data interrupt (MII interrupt) Status.No MII interrupt pending. 1 = MII interrupt pending. | RO | 0 |
| 19.1 | Reserved | Ignore on Read. | RO | 0 |
| 19.0 | Reserved | Ignore on Read. | RO | 0 |
| 1. R/W = Read/Write, RO = Read Only, SC = Self Clearing. | | | | |

Table 53 LED Configuration Register - Address 20, Hex 14 (Sheet 1 of 2)

| Bit | Name | Description | Type ¹ | Default |
|--|-----------------------|--|-------------------|---------|

| 20.11:8 | LED2 Programming bits | 0000 = 0000 = Display Speed Status 0001 = Display Transmit Status 0010 = Display Receive Status 0011 = Display Collision Status 0100 = Display Link Status (Default) 0101 = Display Duplex Status 0110 = Unused 0111 = Display Receive or Transmit Activity 1000 = Test mode - turn LED on 1001 = Test mode - turn LED off 1010 = Test mode - blink LED fast 1011 = Test mode - blink LED slow 1100 = Display Link and Receive Status combined ² (Stretched) ³ 1101 = Display Link and Activity Status combined ² (Stretched) ³ 1110 = Display Duplex and Collision Status combined ⁴ (Stretched) ³ 1111 = Unused | R/W | 0100 |
| <ol style="list-style-type: none"> 1. R/W = Read /Write. RO = Read Only. LH = Latching High 2. Link status is the primary LED driver. The LED is asserted (solid ON) when the link is up. The secondary LED driver (Receive or Activity) causes the LED to change state (blink). Activity causes the LED to blink, regardless of the link status. 3. Combined event LED settings are not affected by Pulse Stretch register bit 20.1. These display settings are stretched regardless of the value of 20.1. 4. Duplex status is the primary LED driver. The LED is asserted (solid ON) when the link is full-duplex. Collision status is the secondary LED driver. The LED changes state (blinks) when a collision occurs. 5. Values are approximations. Not guaranteed or production tested. | | | | |

Table 53 LED Configuration Register - Address 20, Hex 14 (Sheet 2 of 2)

| Bit | Name | Description | Type ¹ | Default |
|--------|-----------------------|---|-------------------|---------|
| 20.7:4 | LED3 Programming bits | 0000 = Display Speed Status 0001 = Display Transmit Status 0010 = Display Receive Status (Default) 0011 = Display Collision Status 0100 = Display Link Status 0101 = Display Duplex Status 0110 = Unused 0111 = Display Receive or Transmit Activity 1000 = Test mode- turn LED on 1001 = Test mode- turn LED off 1010 = Test mode- blink LED fast 1011 = Test mode- blink LED slow 1100 = Display Link and Receive Status combined ² (Stretched) ³ 1101 = Display Link and Activity Status combined ² (Stretched) ³ 1110 = Display Duplex and Collision Status combined ⁴ (Stretched) ³ 1111 = Unused | R/W | 0010 |
| 20.3:2 | LEDFREQ ⁵ | 00 = Stretch LED events to 30 ms. 01 = Stretch LED events to 60 ms. 10 = Stretch LED events to 100 ms. 11 = Reserved. | R/W | 00 |
| 20.1 | PULSE-STRETCH | 0 = Disable pulse stretching of all LEDs. 1 = Enable pulse stretching of all LEDs. | R/W | 1 |
| 20.0 | Reserved | Write as '0'. Ignore on Read. | R/W | 0 |

1. R/W = Read /Write. RO = Read Only. LH = Latching High
 2. Link status is the primary LED driver. The LED is asserted (solid ON) when the link is up. The secondary LED driver (Receive or Activity) causes the LED to change state (blink). Activity causes the LED to blink, regardless of the link status.
 3. Combined event LED settings are not affected by Pulse Stretch register bit 20.1. These display settings are stretched regardless of the value of 20.1.
 4. Duplex status is the primary LED driver. The LED is asserted (solid ON) when the link is full-duplex. Collision status is the secondary LED driver. The LED changes state (blinks) when a collision occurs.
 5. Values are approximations. Not guaranteed or production tested.

Table 54 Digital Configuration Register - Address 26, Hex 1A (Sheet 1 of 2)

| Bit | Name | Description | Type ¹ | Default |
|----------|--------------------|--|-------------------|---------|
| 26.15:12 | Reserved | Write as '0'. Ignore on Read. | R/W | 0000 |
| 26.11 | MII Drive Strength | MII Drive Strength 0 = Normal MII drive strength 1 = Increase MII drive strength | R/W | 0 |
| 26.10 | Reserved | Write as '0'. Ignore on Read. | R/W | 0 |
| 26.9 | Show Symbol Error | Show Symbol Error 0 = Normal MII_RXER 1 = 100BASE-X Error Signal to MII_RxER | R/W | 0 |
| 26.8:6 | Reserved | Write as '0'. Ignore on Read. | RO | 0 |

1. R/W = Read /Write, RO = Read Only

Table 54 Digital Configuration Register - Address 26, Hex 1A (Sheet 2 of 2)

| Bit | Name | Description | Type ¹ | Default |
|--------|----------|-------------------------------|-------------------|---------|
| 26.5:4 | Reserved | Write as '0'. Ignore on Read. | R/W | 00 |
| 26.3 | Reserved | Write as '0'. Ignore on Read. | RO | 0 |
| 26.2:0 | Reserved | Write as '0'. Ignore on Read. | R/W | 0 |

1. R/W = Read /Write, RO = Read Only

Table 55 Transmit Control Register - Address 30, Hex 1E

| Bit | Name | Description | Type ² | Default |
|----------|-------------------------------------|--|-------------------|---------|
| 30.15:13 | Reserved | Write as '0'. Ignore on Read. | R/W | 000 |
| 30.12 | Transmit Low Power | Transmit Low Power 0 = Normal transmission. 1 = Forces the transmitter into low power mode. Also forces a zero-differential transmission. | R/W | 0 |
| 30.11:10 | Port Rise Time Control ¹ | Port Rise Time Control 00 = 3.0 ns (Default = Setting on TXSLEW[1:0] pins) 01 = 3.4 ns 10 = 3.9 ns 11 = 4.4 ns | R/W | Note 3 |
| 30.4:0 | Reserved | Ignore on Read. | R/W | 0 |

1. Values are approximations and may vary outside indicated values based upon implementation loading conditions.
 2. R/W = Read/Write
 3. Latch State during Reset is based on the state of hardware configuration pins at RESET_L.
