Low-Power, High-Speed CMOS Analog Switches

DESCRIPTION

The DG401, DG403, DG405 monolithic analog switches were designed to provide precision, high performance switching of analog signals. Combining low power (0.35 µW, typ.) with high speed (t_{ON}: 75 ns, typ.), the DG401 series is ideally suited for portable and battery powered industrial and military applications.

Built on the Vishay Siliconix proprietary high-voltage silicon-gate process to achieve high voltage rating and superior switch on/off performance, break-before-make is guaranteed for the SPDT configurations. An epitaxial layer prevents latchup.

Each switch conducts equally well in both directions when on, and blocks up to 30 V peak-to-peak when off. On-resistance is very flat over the full ± 15 V analog range, rivaling JFET performance without the inherent dynamic range limitations.

The three devices in this series are differentiated by the type of switch action as shown in the functional block diagrams.

FEATURES

- 44 V supply max. rating
- ± 15 V analog signal range
- On-resistance - R_{DS}(on): 30 Ω
- Low leakage - $I_{D(on)}$: 40 pA
- Fast switching - t_{ON}: 75 ns
- Ultra low power requirements - P_D: 0.35 µW
- TTL, CMOS compatible
- Single supply capability
- **Compliant to RoHS directive 2002/95/EC**

Pb-free Available

RoHS* COMPLIANT

BENEFITS

- Wide dynamic range
- Break-before-make switching action
- Simple interfacing

APPLICATIONS

- Audio and video switching
- Sample-and-hold circuits
- Battery operation
- Test equipment
- Communications systems
- PBX, PABX

ABSOLUTE MAXIMUM RATINGS

Parameter		Limit	Unit
V+ to V-		44	V
GND to V-		25	
V_L		(GND - 0.3) to (V+) + 0.3	
Digital Inputs[a], V_S, V_D		(V-) - 2 to (V+) + 2 or 30 mA, whichever occurs first	
Current (Any Terminal) Continuous		30	mA
Current, S or D (Pulsed 1 ms, 10 % Duty)		100	
Storage Temperature	(DJ, DY Suffix)	- 65 to 125	°C
Power Dissipation (Package)[b]	16-Pin Plastic DIP[c]	450	mW
	16-Pin SOIC[d]	600	

Notes:
a. Signals on S_X, D_X, or IN_X exceeding V+ or V- will be clamped by internal diodes. Limit forward diode current to maximum current ratings.
b. All leads welded or soldered to PC board.
c. Derate 6 mW/°C above 75 °C.
d. Derate 7.6 mW/°C above 75 °C.

Notes:
a. Refer to PROCESS OPTION FLOWCHART.
b. Room = 25 °C, Full = as determined by the operating temperature suffix.
c. Typical values are for DESIGN AID ONLY, not guaranteed nor subject to production testing.
d. The algebraic convention whereby the most negative value is a minimum and the most positive a maximum, is used in this datasheet.
e. Guaranteed by design, not subject to production test.
f. V_{IN} = input voltage to perform proper function.

Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

APPLICATIONS

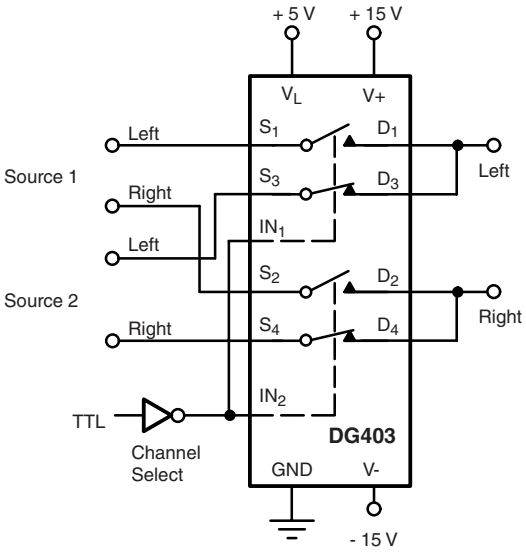

Figure 9. Stereo Source Selector

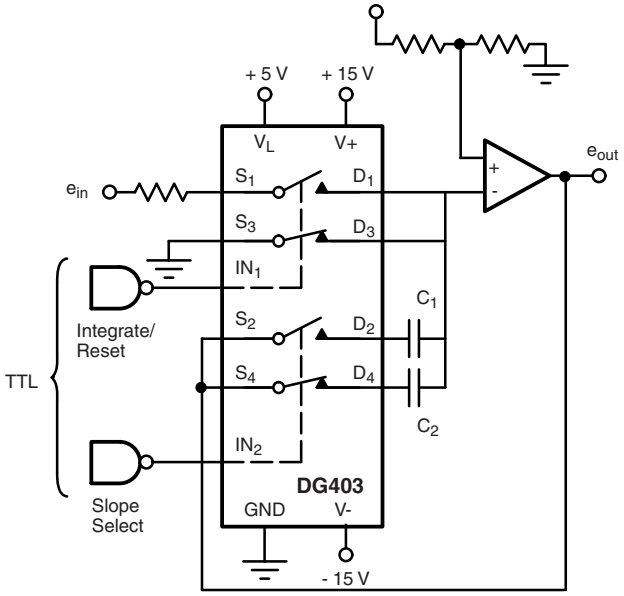

Figure 10. Dual Slope Integrator

Dual Slope Integrators:

The DG403 is well suited to configure a selectable slope integrator. One control signal selects the timing capacitor C_1 or C_2. Another one selects e_{in} or discharges the capacitor in preparation for the next integration cycle.

Band-Pass Switched Capacitor Filter:

Single-pole double-throw switches are a common element for switched capacitor networks and filters. The fast switching times and low leakage of the DG403 allow for higher clock rates and consequently higher filter operating frequencies.

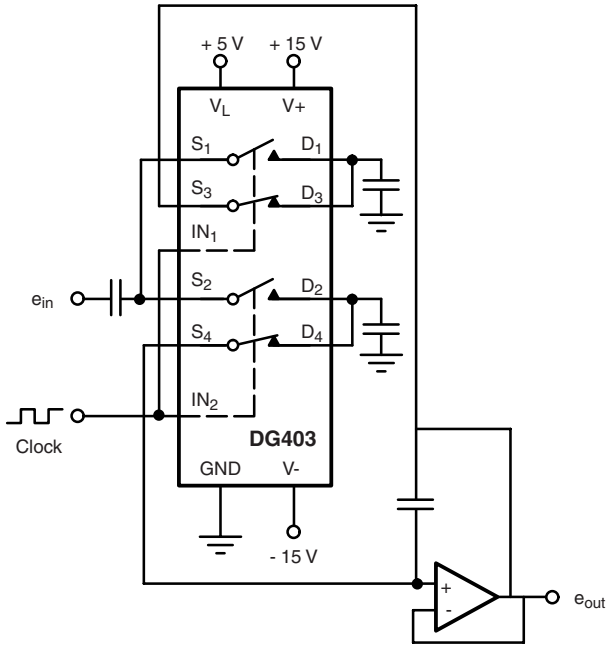

Figure 11. Band-Pass Switched Capacitor Filter

APPLICATIONS

Peak Detector:

A_3 acting as a comparator provides the logic drive for operating SW_1. The output of A_2 is fed back to A_3 and compared to the analog input e_{in}. If $e_{in} > e_{out}$ the output of A_3 is high keeping SW_1 closed. This allows C_1 to charge up to the analog input voltage. When e_{in} goes below e_{out} A_3 goes negative, turning SW_1 off. The system will therefore store the most positive analog input experienced.

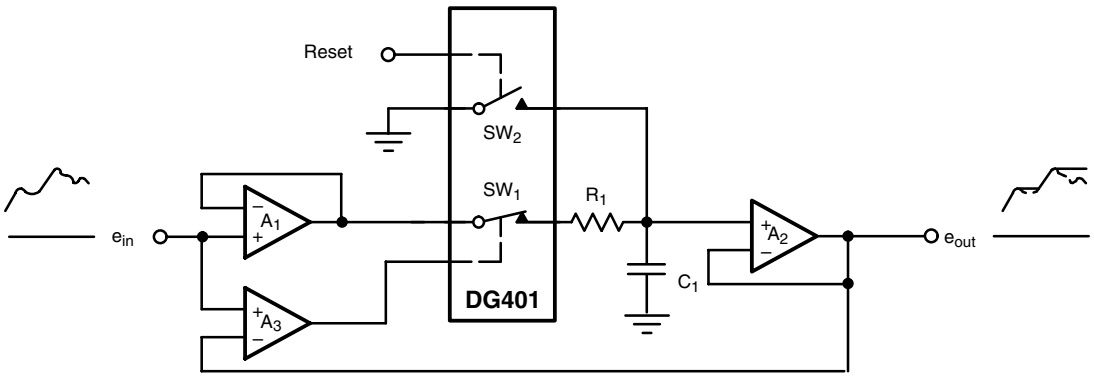

Figure 12. Positive Peak Detector
