# LRI2K

2048-bit EEPROM tag IC at 13.56 MHz, with 64-bit UID and kill code, ISO 15693 and ISO 18000-3 Mode 1 compliant

Features

■ ISO 15693 standard fully compliant

■ ISO 18000-3 Mode 1 standard fully compliant

■ 13.56 MHz ±7 kHz carrier frequency

■ To tag: 10% or 100% ASK modulation using 1/4 (26 Kbit/s) or 1/256 (1.6 Kbit/s) pulse position coding

■ From tag: load modulation using Manchester coding with 423 kHz and 484 kHz subcarriers in low (6.6 Kbit/s) or high (26 Kbit/s) data rate mode. Supports the 53 Kbit/s data rate with Fast commands

■ Internal tuning capacitor (21 pF, 23.5 pF, 28.5 pF, 97 pF)

■ 1 000 000 Erase/Write cycles (minimum)

■ 40 year data retention (minimum)

■ 2048 bits EEPROM with Block Lock feature

■ 64-bit unique identifier (UID)

■ Electrical article surveillance capable (software controlled)

■ Kill function

■ Read & Write (Block of 32 bits)

■ 5 ms programming time

■ Packages
  – ECOPACK® (RoHS compliant)

UFDFPN8 (MB)
2 × 3 mm² (MLP)

1 Description

The LRI2K is a contactless memory powered by the received carrier electromagnetic wave. It is a 2048-bit electrically erasable programmable memory (EEPROM). The memory is organized as 64 blocks of 32 bits. The LRI2K is accessed via the 13.56 MHz carrier electromagnetic wave on which incoming data are demodulated from the received signal amplitude modulation (ASK: amplitude shift keying). The received ASK wave is 10% or 100% modulated with a data rate of 1.6 Kbit/s using the 1/256 pulse coding mode or a data rate of 26 Kbit/s using the 1/4 pulse coding mode.

Outgoing data are generated by the LRI2K load variation using Manchester coding with one or two subcarrier frequencies at 423 kHz and 484 kHz. Data are transferred from the LRI2K at 6.6 Kbit/s in low data rate mode and 26 Kbit/s fast data rate mode. The LRI2K supports 53 Kbit/s in high data rate mode with one subcarrier frequency at 423 kHz.

The LRI2K follows the ISO 15693 recommendation for radio-frequency power and signal interface.

1.1 Memory mapping

The LRI2K is divided into 64 blocks of 32 bits. Each block can be individually write-protected using the Lock command.

Table 2.   LRI2K memory map

	Kill code			

The User area consists of blocks that are always accessible in read mode. Write operations are possible if the addressed block is not protected. During a write operation, the 32 bits of the block are replaced by the new 32-bit value.

The LRI2K also has a 64-bit block that is used to store the 64-bit unique identifier (UID). The UID is compliant to the ISO 15963 description, and its value is used during the anticollision sequence (Inventory). This block is not accessible by the user and its value is written by ST on the production line.

The LRI2K also includes an AFI register in which the application family identifier is stored, and a DSFID register in which the data storage family identifier used in the anticollision algorithm is stored. The LRI2K has an additional 32-bit block in which the kill code is stored.

1.2 Commands

The LRI2K supports the following commands:

- ● *Inventory*, used to perform the anticollision sequence.
- ● *Stay Quiet*, used to put the LRI2K in quiet mode, where it does not respond to any inventory command.
- ● *Select*, used to select the LRI2K. After this command, the LRI2K processes all Read/Write commands with Select_flag set.
- ● *Reset To Ready*, used to put the LRI2K in the ready state.
- ● *Read Block*, used to output the 32 bits of the selected block and its locking status.
- ● *Write Block*, used to write the 32-bit value in the selected block, provided that it is not locked.
- ● *Lock Block*, used to lock the selected block. After this command, the block cannot be modified.
- ● *Read Multiple Blocks*, used to read the selected blocks and send back their value.
- ● *Write AFI*, used to write the 8-bit value in the AFI register.
- ● *Lock AFI*, used to lock the AFI register.
- ● *Write DSFID*, used to write the 8-bit value in the DSFID register.
- ● *Lock DSFID*, used to lock the DSFID register.
- ● *Get System Info*, used to provide the system information value
- ● *Get Multiple Block Security Status*, used to send the security status of the selected block.
- ● *Initiate*, used to trigger the tag response to the Inventory Initiated sequence.
- ● *Inventory Initiated*, used to perform the anticollision sequence triggered by the Initiate command.
- ● *Kill*, used to definitively deactivate the tag.
- ● *Write Kill*, used to write the 32-bit Kill code value
- ● *Lock Kill*, used to lock the Kill Code register.
- ● *Fast Initiate*, used to trigger the tag response to the Inventory Initiated sequence.
- ● *Fast Inventory Initiated*, used to perform the anticollision sequence triggered by the Initiate command.
- ● *Fast Read Block*, used to output the 32 bits of the selected block and its locking status.
- ● *Fast Read Multiple Blocks*, used to read the selected blocks and send back their value.

1.3   Initial dialogue for vicinity cards

The dialog between the vicinity coupling device (VCD) and the vicinity integrated circuit card or VICC (LRI2K) takes place as follows:

●   activation of the LRI2K by the RF operating field of the VCD

●   transmission of a command by the VCD

●   transmission of a response by the LRI2K

These operations use the RF power transfer and communication signal interface described below (see *Power transfer*, *Frequency* and *Operating field*). This technique is called RTF (reader talk first).

1.3.1   Power transfer

Power is transferred to the LRI2K by radio frequency at 13.56 MHz via coupling antennas in the LRI2K and the VCD. The RF operating field of the VCD is transformed on the LRI2K antenna as an AC voltage which is rectified, filtered and internally regulated. The amplitude modulation (ASK) on this received signal is demodulated by the ASK demodulator.

1.3.2   Frequency

The ISO 15693 standard defines the carrier frequency (f_c) of the operating field as 13.56 MHz ±7 kHz.

1.3.3   Operating field

The LRI2K operates continuously between H_{min} and H_{max}.

●   The minimum operating field is H_{min} and has a value of 150 mA/m rms.

●   The maximum operating field is H_{max} and has a value of 5 A/m rms.

A VCD must generate a field of at least H_{min} and not exceeding H_{max} in the operating volume.

2 Communication signal from VCD to LRI2K

Communications between the VCD and the LRI2K take place using the modulation principle of ASK (amplitude shift keying). Two modulation indexes are used, 10% and 100%. The LRI2K decodes both. The VCD determines which index is used.

The modulation index is defined as $[a - b]/[a + b]$ where a is the peak signal amplitude and b the minimum signal amplitude of the carrier frequency.

Depending on the choice made by the VCD, a "pause" will be created as described in *Figure 3* and *Figure 4*.

The LRI2K is operational for any degree of modulation index between 10% and 30%.

Figure 3. 100% modulation waveform
Table 3. 10% modulation parameters

Symbol	Parameter definition	Value
hr	$0.1 \times (a - b)$	max
hf	$0.1 \times (a - b)$	max

Figure 4. 10% modulation waveform
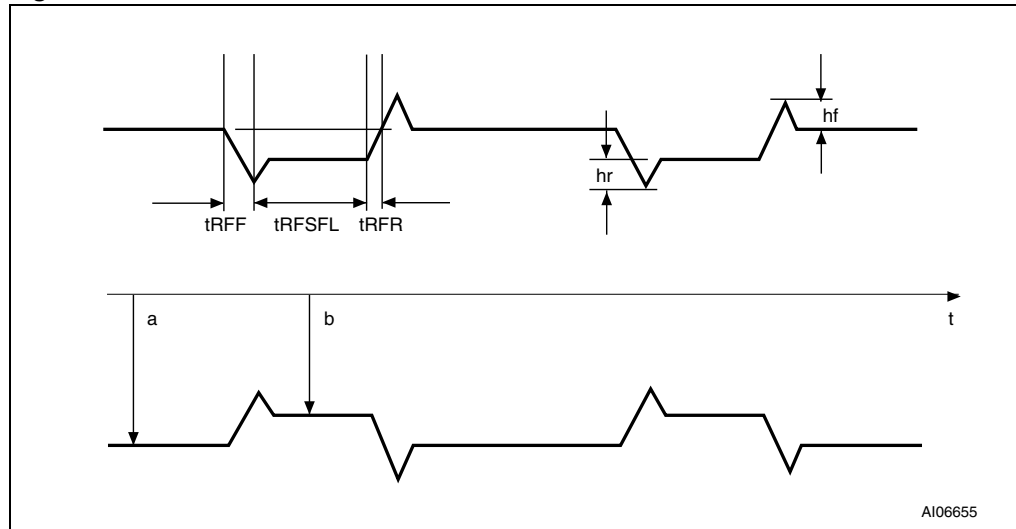

3   Data rate and data coding

The data coding implemented in the LRI2K uses pulse position modulation. Both data coding modes that are described in the ISO 15693 are supported by the LRI2K. The selection is made by the VCD and indicated to the LRI2K within the start of frame (SOF).

3.1   Data coding mode: 1 out of 256

The value of one single byte is represented by the position of one pause. The position of the pause on 1 of 256 successive time periods of 18.88 µs (256/f_C), determines the value of the byte. In this case the transmission of one byte takes 4.833 ms and the resulting data rate is 1.65 Kbits/s (f_C/8192).

Figure 5 illustrates this pulse position modulation technique. In this Figure, data E1h (225 decimal) is sent by the VCD to the LRI2K.

The pause occurs during the second half of the position of the time period that determines the value, as shown in *Figure 6*.

A pause during the first period transmits the data value 00h. A pause during the last period transmits the data value FFh (255 decimal).

Figure 5.   1 out of 256 coding mode
Figure 6.   Detail of one time period
3.2   Data coding mode: 1 out of 4

The value of 2 bits is represented by the position of one pause. The position of the pause on 1 of 4 successive time periods of 18.88 μs (256/f_C) determines the value of the 2 bits. Four successive pairs of bits form a byte, where the least significant pair of bits is transmitted first.

In this case the transmission of one byte takes 302.08 μs and the resulting data rate is 26.48 Kbit/s (f_C/512). *Figure 7* illustrates the 1 out of 4 pulse position technique and coding. *Figure 8* shows the transmission of E1h (225d - 1110 0001b) by the VCD.

Figure 7.   1 out of 4 coding mode
Figure 8.   1 out of 4 coding example
3.3 VCD to LRI2K frames

Frames are delimited by a start of frame (SOF) and an end of frame (EOF). They are implemented using code violation. Unused options are reserved for future use.

The LRI2K is ready to receive a new command frame from the VCD 311.5 µs (t_2) after sending a response frame to the VCD.

The LRI2K takes a Power-On time of 0.1 ms after being activated by the powering field. After this delay, the LRI2K is ready to receive a command frame from the VCD.

3.4 Start of frame (SOF)

The SOF defines the data coding mode the VCD is to use for the following command frame.

The SOF sequence described in *Figure 9* selects the 1 out of 256 data coding mode.

The SOF sequence described in *Figure 10* selects the 1 out of 4 data coding mode.

The EOF sequence for either coding mode is described in *Figure 11*.

Figure 9. SOF to select 1 out of 256 data coding mode
Figure 10. SOF to select 1 out of 4 data coding mode
Figure 11. EOF for either data coding mode
4   Communications signal from LRI2K to VCD

The LRI2K has several modes defined for some parameters, owing to which it can operate in different noise environments and meet different application requirements.

4.1   Load modulation

The LRI2K is capable of communication with the VCD via an inductive coupling area whereby the carrier is loaded to generate a subcarrier with frequency f_S. The subcarrier is generated by switching a load in the LRI2K.

The load-modulated amplitude received on the VCD antenna shall be at least 10 mV when measured as described in the test methods defined in International Standard ISO 10373-7.

4.2   Subcarrier

The LRI2K supports the one-subcarrier and two-subcarrier response formats. These formats are selected by the VCD using the first bit in the protocol header. When one subcarrier is used, the frequency f_{S1} of the subcarrier load modulation is 423.75 kHz (f_C/32). When two subcarriers are used, frequency f_{S1} is 423.75 kHz (f_C/32), and frequency f_{S2} is 484.28 kHz (f_C/28). When using the two-subcarrier mode, the LRI2K generates a continuous phase relationship between f_{S1} and f_{S2}.

4.3   Data rates

The LRI2K can respond using the low or the high data rate format. The selection of the data rate is made by the VCD using the second bit in the protocol header. It also supports the x2 mode available on all the Fast commands. Table 4 shows the different data rates produced by the LRI2K using the different response format combinations.

Table 4.   Response data rate

Data rate		One subcarrier	Two subcarriers
Low	Standard commands	6.62 Kbits/s (f_C/2048)	6.67 Kbits/s (f_C/2032)
	Fast commands	13.24 Kbits/s (f_C/1024)	not applicable
High	Standard commands	26.48 Kbits/s (f_C/512)	26.69 Kbits/s (f_C/508)
	Fast commands	52.97 Kbits/s (f_C/256)	not applicable

5 Bit representation and coding

Data bits are encoded using Manchester coding, according to the following schemes. For the low data rate, the same subcarrier frequency or frequencies is/are used, in this case the number of pulses is multiplied by 4 and all times are increased by this factor. For the Fast commands using one subcarrier, all pulse numbers and times are divided by 2.

5.1 Bit coding using one subcarrier

5.1.1 High data rate

A logic 0 starts with 8 pulses at 423.75 kHz (f_C/32) followed by an unmodulated time of 18.88 μs as shown in *Figure 12*.

6 LRI2K to VCD frames

Frames are delimited by an SOF and an EOF. They are implemented using code violation. Unused options are reserved for future use. For the low data rate, the same subcarrier frequency or frequencies is/are used. In this case the number of pulses is multiplied by 4. For the Fast commands using one subcarrier, all pulse numbers and times are divided by 2.

6.1 SOF when using one subcarrier

6.1.1 High data rate

The SOF includes an unmodulated time of 56.64 µs followed by 24 pulses at 423.75 kHz (f_C/32), and a logic 1 that consists of an unmodulated time of 18.88 µs followed by 8 pulses at 423.75 kHz. The SOF is shown in *Figure 24*.

Figure 24. Start of frame, high data rate, one subcarrier
For the Fast commands, the SOF comprises an unmodulated time of 28.32 µs, followed by 12 pulses at 423.75 kHz (f_C/32), and a logic 1 that consists of an unmodulated time of 9.44 µs followed by 4 pulses at 423.75 kHz as shown in *Figure 25*.

Figure 25. Start of frame, high data rate, one subcarrier x2
6.1.2   Low data rate

SOF comprises an unmodulated time of 226.56 µs, followed by 96 pulses at 423.75 kHz (f_C/32), and a logic 1 that consists of an unmodulated time of 75.52 µs followed by 32 pulses at 423.75 kHz as shown in *Figure 26*.

Figure 26.   Start of frame, low data rate, one subcarrier
For the Fast commands, the SOF comprises an unmodulated time of 113.28 µs followed by 48 pulses at 423.75 kHz (f_C/32), and a logic 1 that includes an unmodulated time of 37.76 µs followed by 16 pulses at 423.75 kHz as shown in *Figure 27*.

Figure 27.   Start of frame, low data rate, one subcarrier x2
6.2   SOF when using two subcarriers

6.2.1   High data rate

The SOF comprises 27 pulses at 484.28 kHz (f_C/28), followed by 24 pulses at 423.75 kHz (f_C/32), and a logic 1 that includes 9 pulses at 484.28 kHz followed by 8 pulses at 423.75 kHz as shown in *Figure 28*.

For the Fast commands, the x2 mode is not available.

Figure 28.   Start of frame, high data rate, two subcarriers
6.2.2   Low data rate

The SOF comprises 108 pulses at 484.28 kHz (f_C/28) followed by 96 pulses at 423.75 kHz (f_C/32), and a logic 1 that includes 36 pulses at 484.28 kHz followed by 32 pulses at 423.75 kHz as shown in *Figure 29*.

For the Fast commands, the x2 mode is not available.

Figure 29.   Start of frame, low data rate, two subcarriers
6.3   EOF when using one subcarrier

6.3.1   High data rate

The EOF comprises a logic 0 that includes 8 pulses at 423.75 kHz and an unmodulated time of 18.88 µs, followed by 24 pulses at 423.75 kHz (f_C/32) and by an unmodulated time of 56.64 µs as shown in *Figure 30*.

Figure 30.   End of frame, high data rate, one subcarrier
For the Fast commands, the EOF comprises a logic 0 that includes 4 pulses at 423.75 kHz and an unmodulated time of 9.44 µs, followed by 12 pulses at 423.75 kHz (f_C/32) and an unmodulated time of 28.32 µs as shown in *Figure 31*.

Figure 31.   End of frame, high data rate, one subcarrier x2

6.3.2   Low data rate

The EOF comprises a logic 0 that includes 32 pulses at 423.75 kHz and an unmodulated time of 75.52 µs, followed by 96 pulses at 423.75 kHz (f_C/32) and an unmodulated time of 226.56 µs as shown in *Figure 32*.

Figure 32.   End of frame, low data rate, one subcarrier
For the Fast commands, the EOF comprises a logic 0 that includes 16 pulses at 423.75 kHz and an unmodulated time of 37.76 µs, followed by 48 pulses at 423.75 kHz (f_C/32) and an unmodulated time of 113.28 µs as shown in *Figure 33*.

Figure 33.   End of frame, low data rate, one subcarrier x2
6.4 EOF when using two subcarriers

6.4.1 High data rate

The EOF comprises a logic 0 that includes 8 pulses at 423.75 kHz and 9 pulses at 484.28 kHz, followed by 24 pulses at 423.75 kHz (f_C/32) and 27 pulses at 484.28 kHz (f_C/28) as shown in *Figure 34*.

For the Fast commands, the x2 mode is not available.

Figure 34. End of frame, high data rate, two subcarriers
6.4.2 Low data rate

The EOF comprises a logic 0 that includes 32 pulses at 423.75 kHz and 36 pulses at 484.28 kHz, followed by 96 pulses at 423.75 kHz (f_C/32) and 108 pulses at 484.28 kHz (f_C/28) as shown in *Figure 35*

For the fast commands, the x2 mode is not available.

Figure 35. End of frame, low data rate, two subcarriers
7   Unique identifier (UID)

The LRI2Ks are uniquely identified by a 64-bit Unique Identifier (UID). This UID complies with ISO/IEC 15963 and ISO/IEC 7816-6. The UID is a read-only code, and comprises:

●   the 8 MSBs are E0h

●   the IC manufacturer code of ST 02h, on 8 bits (ISO/IEC 7816-6/AM1)

●   a unique serial number on 48 bits.

Table 5.   UID format

MSB   **LSB**

63 56	55 48	47 0
E0h	02h	Unique serial number

With the UID each LRI2K can be addressed uniquely and individually during the anticollision loop and for one-to-one exchanges between a VCD and an LRI2K.

8 Application family identifier (AFI)

The AFI (application family identifier) represents the type of application targeted by the VCD and is used to identify, among all the LRI2Ks present, only the LRI2Ks that meet the required application criteria.

Figure 36. LRI2K decision tree for AFI
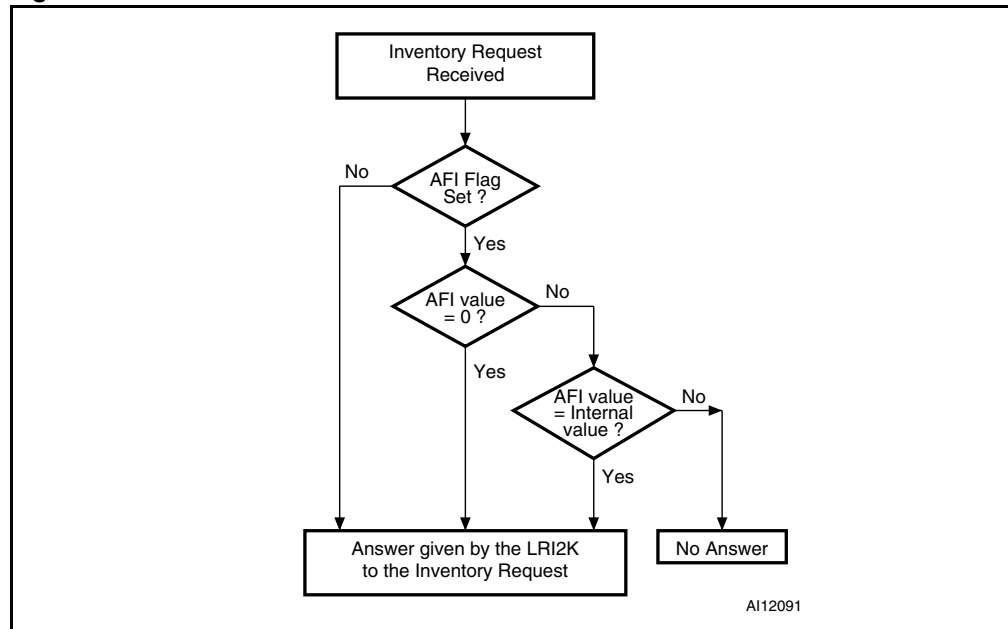

The AFI is programmed by the LRI2K issuer (or purchaser) in the AFI register. Once programmed and Locked, it can no longer be modified.

The most significant nibble of the AFI is used to code one specific or all application families.

The least significant nibble of the AFI is used to code one specific or all application subfamilies. subfamily codes different from 0 are proprietary.

(See ISO 15693-3 documentation)

9 Data storage format identifier (DSFID)

The data storage format identifier indicates how the data is structured in the LRI2K memory. The logical organization of data can be known instantly using the DSFID.

It can be programmed and locked using the Write DSFID and Lock DSFID commands, respectively. It is coded on one byte.

9.1 CRC

The CRC used in the LRI2K is calculated as per the definition in ISO/IEC 13239.

The initial register contents are all ones: "FFFF".

The two-byte CRC is appended to each request and response, within each frame, before the EOF. The CRC is calculated on all the bytes between the SOF and the CRC field.

Upon reception of a request from the VCD, the LRI2K verifies that the CRC value is valid. If it is invalid, the LRI2K discards the frame and does not answer to the VCD.

Upon reception of a response from the LRI2K, it is recommended that the VCD verifies whether the CRC value is valid. If it is invalid, actions to be performed are left to the discretion of the VCD designers.

The CRC is transmitted least significant byte first.

Each byte is transmitted least significant bit first.

Table 6.   CRC transmission rules

LSByte		MSByte	
LSBit	**MSBit**	**LSBit**	**MSBit**
CRC 16 (8bits)		CRC 16 (8 bits)	

10   LRI2K protocol description

The transmission protocol (or simply protocol) defines the mechanism used to exchange instructions and data between the VCD and the LRI2K, in both directions. It is based on the concept of "VCD talks first".

This means that an LRI2K will not start transmitting unless it has received and properly decoded an instruction sent by the VCD. The protocol is based on an exchange of:

● a request from the VCD to the LRI2K
● a response from the LRI2K to the VCD

Each request and each response are contained in a frame. The frame delimiters (SOF, EOF) are described in *Section 6: LRI2K to VCD frames*.

Each request consists of:

● a request SOF (see *Figure 9* and *Figure 10*)
● flags
● a command code
● parameters, depending on the command
● application data
● a 2-byte CRC
● a request EOF (see *Figure 11*)

Each response consists of:

● an answer SOF (see *Figure 24* to *Figure 29*)
● flags
● parameters, depending on the command
● application data
● a 2-byte CRC
● an Answer EOF (see *Figure 30* to *Figure 35*)

The protocol is bit-oriented. The number of bits transmitted in a frame is a multiple of eight (8), i.e. an integer number of bytes.

A single-byte field is transmitted least significant bit (LSBit) first. A multiple-byte field is transmitted least significant byte (LSByte) first, with each byte transmitted least significant bit (LSBit) first.

The setting of the flags indicates the presence of the optional fields. When the flag is set (to one), the field is present. When the flag is reset (to zero), the field is absent.

Response SOF	Response Flags	Parameters	Data	2 byte CRC	Response EOF

Figure 37.   LRI2K protocol timing
11 LRI2K states

An LRI2K can be in one of 4 states:

● Power-off
● Ready
● Quiet
● Selected

Transitions between these states are specified in *Figure 38: LRI2K state transition diagram* and *Table 9: LRI2K response depending on request flags*.

11.1 Power-off state

The LRI2K is in the Power-off state when it does not receive enough energy from the VCD.

11.2 Ready state

The LRI2K is in the Ready state when it receives enough energy from the VCD. When in the Ready state, the LRI2K answers any request where the Select_flag is not set.

11.3 Quiet state

When in the Quiet state, the LRI2K answers any request except for Inventory requests with the Address_flag set.

11.4 Selected state

In the Selected state, the LRI2K answers any request in all modes (see *Section 12: Modes*):

● request in Select mode with the Select flag set
● request in Addressed mode if the UID matches
● request in Non-Addressed mode as it is the mode for general requests

Table 9.   LRI2K response depending on request flags

Flags	Address_flag		Select_flag	
	1 **Addressed**	**0** **Non addressed**	**1** **Selected**	**0** **Non selected**
LRI2K in Ready or Selected state (Devices in Quiet state don't answer)		X		X
LRI2K in Selected state		X	X	
LRI2K in Ready, Quiet or Selected state (the device which match the UID)	X			X
Error (03h)	X		X	

Figure 38.   LRI2K state transition diagram
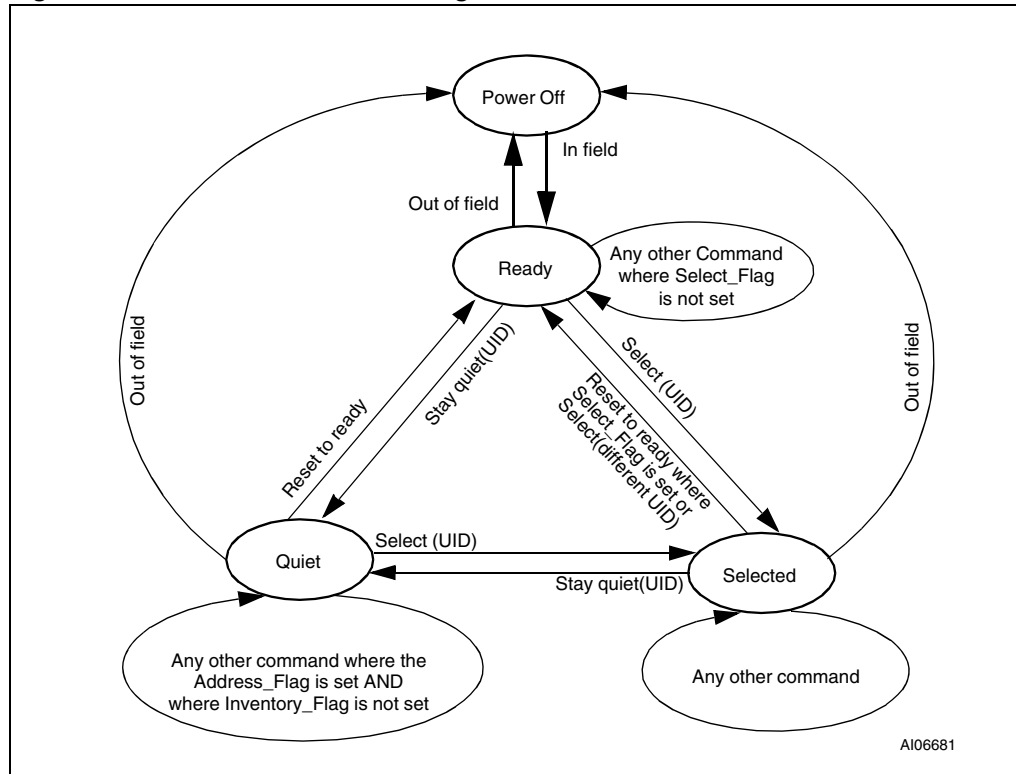

1.   The intention of the state transition method is that only one LRI2K should be in the selected state at a time.

12 Modes

The term "mode" refers to the mechanism used in a request to specify the set of LRI2Ks that will answer the request.

12.1 Addressed mode

When the Address_flag is set to 1 (Addressed mode), the request contains the Unique ID (UID) of the addressed LRI2K.

Any LRI2K that receives a request with the Address_flag set to 1 compares the received Unique ID to its own. If it matches, then the LRI2K executes the request (if possible) and returns a response to the VCD as specified in the command description.

If its UID does not match, then it remains silent.

12.2 Non-Addressed mode (general request)

When the Address_flag is set to 0 (Non-Addressed mode), the request does not contain a Unique ID. Any LRI2K receiving a request with the Address_flag set to 0 executes it and returns a response to the VCD as specified in the command description.

12.3 Select mode

When the Select_flag is set to 1 (Select mode), the request does not contain an LRI2K Unique ID. The LRI2K in the Selected state that receives a request with the Select_flag set to 1 executes it and returns a response to the VCD as specified in the command description.

Only LRI2Ks in the Selected state answer to a request where the Select Flag is set to 1.

The system design ensures in theory that only one LRI2K can be in the Select state at a time.

13 Request format

The request consists of:
- an SOF
- flags
- a command code
- parameters and data
- a CRC
- an EOF

Table 10.   General request format

S O F	Request flags	Command code	Parameters	Data	CRC	E O F

13.1 Request flags

In a request, the "flags" field specifies the actions to be performed by the LRI2K and whether corresponding fields are present or not.

The flags field consists of eight bits.

The bit 3 (Inventory_flag) of the request flag defines the contents of the 4 MSBs (bits 5 to 8).

When bit 3 is reset (0), bits 5 to 8 define the LRI2K selection criteria.

When bit 3 is set (1), bits 5 to 8 define the LRI2K Inventory parameters.

Table 11.   Definitions of request flags 1 to 4

Bit No	Flag	Level	Description
Bit 1	Subcarrier_flag[1]	0	A single subcarrier frequency is used by the LRI2K
		1	Two subcarriers are used by the LRI2K
Bit 2	Data_rate_flag[2]	0	Low data rate is used
		1	High data rate is used
Bit 3	Inventory flag	0	The meaning of Flags 5 to 8 is described in *Table 12*
		1	The meaning of Flags 5 to 8 is described in *Table 13*
Bit 4	Protocol Extension flag	0	No Protocol format extension

1. *Subcarrier_flag refers to the* LRI2K-*to-VCD communication.*

2. *Data_rate_flag refers to the* LRI2K-*to-VCD communication*

Table 12.   Request flags 5 to 8 when bit 3 = 0

Bit No	Flag	Level	Description
Bit 5	Select_flag[1]	0	Request is executed by any LRI2K according to the setting of Address_flag
		1	Request is executed only by the LRI2K in Selected state
Bit 6	Address_flag[1]	0	Request is not addressed. UID field is not present. The request is executed by all LRI2Ks.
		1	Request is addressed. UID field is present. The request is executed only by the LRI2K whose UID matches the UID specified in the request.
Bit 7	Option flag	0	
Bit 8	RFU	0	

1.   If the Select_flag is set to 1, the Address_flag is set to 0 and the UID field is not present in the request.

Table 13.   Request flags 5 to 8 when bit 3 = 1

Bit No	Flag	Level	Description
Bit 5	AFI flag	0	AFI field is not present
		1	AFI field is present
Bit 6	Nb_slots flag	0	16 slots
		1	1 slot
Bit 7	Option flag	0	
Bit 8	RFU	0	

14 Response format

The response consists of:
- an SOF
- flags
- parameters and data
- a CRC
- an EOF

Table 14.   General response format

S O F	Response flags	Parameters	Data	CRC	E O F

14.1 Response flags

In a response, the flags indicate how actions have been performed by the LRI2K and whether corresponding fields are present or not. The response flags consist of eight bits.

Table 15.   Definitions of response flags 1 to 8

Bit No.	Flag	Level	Description
Bit 1	Error_flag	0	No error
		1	Error detected. Error code is in the "Error" field.
Bit 2	RFU	0	
Bit 3	RFU	0	
Bit 4	Extension flag	0	No extension
Bit 5	RFU	0	
Bit 6	RFU	0	
Bit 7	RFU	0	
Bit 8	RFU	0	

14.2   Response error code

If the Error_flag is set by the LRI2K in the response, the Error code field is present and provides information about the error that occurred.

Error codes not specified in *Table 16* are reserved for future use.

Table 16.   Response error code definition

Error code	Meaning
03h	The command option is not supported
0F	Error with no information given or a specific error code is not supported.
10h	The specified block is not available (does not exist).
11h	The specified block is already locked and thus cannot be locked again
12h	The specified block is locked and its contents cannot be changed.
13h	The specified block was not successfully programmed.
14h	The specified block was not successfully locked.

15   Anticollision

The purpose of the anticollision sequence is to inventory the LRI2Ks present in the VCD field using their unique ID (UID).

The VCD is the master of communications with one or several LRI2Ks. It initiates LRI2K communication by issuing the Inventory request.

The LRI2K sends its response in the determined slot or does not respond.

15.1   Request parameters

When issuing the Inventory command, the VCD:
● sets the Nb_slots_flag as desired,
● adds the mask length and the mask value after the command field,

The mask length is the number of significant bits of the mask value.

The mask value is contained in an integer number of bytes. The mask length indicates the number of significant bits. The LSB is transmitted first.

If the mask length is not a multiple of 8 (bits), as many 0-bits as required will be added to the mask value MSB so that the mask value is contained in an integer number of bytes.

The next field starts on the next byte boundary.

Table 17.   Inventory request format

MSB   LSB

SOF	Request_ flags	Command	Optional AFI	Mask length	Mask value	CRC	EOF
	8 bits	8 bits	8 bits	8 bits	0 to 8 bytes	16 bits	

In the example of *Table 18* and *Figure 39*, the mask length is 11 bits. Five 0-bits are added to the mask value MSB. The 11-bit Mask and the current slot number are compared to the UID.

Table 18.   Example of the addition of 0-bits to an 11-bit mask value

(b_{15}) MSB	LSB (b_0)
0000 0	100 1100 1111
0-bits added	11-bit mask value

Figure 39. Principle of comparison between the mask, the slot number and the UID
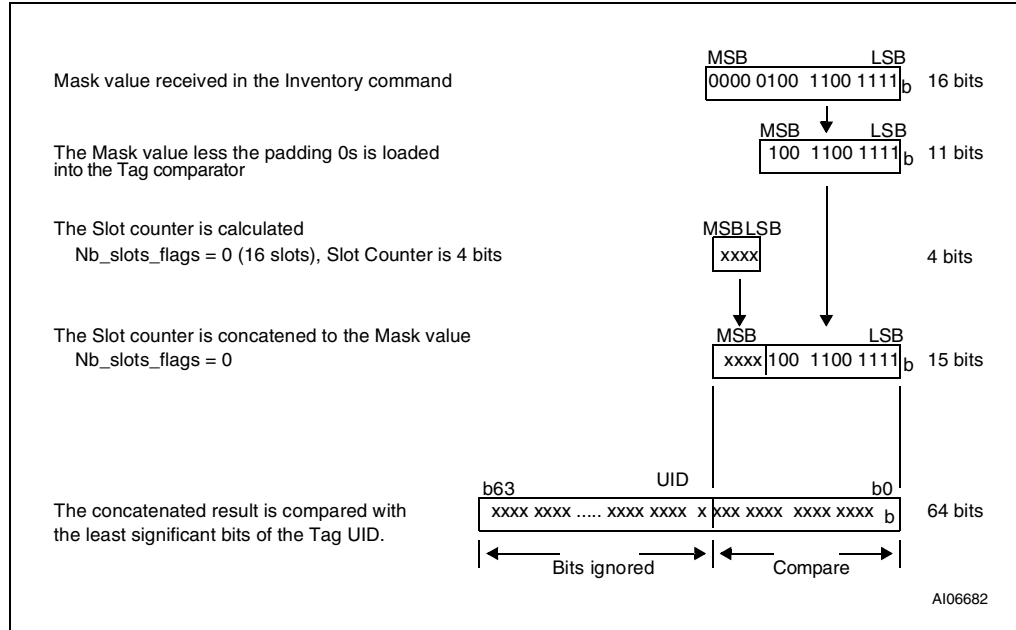

The AFI field is present if the AFI_flag is set.

The pulse is generated according to the definition of the EOF in ISO/IEC 15693-2.

The first slot starts immediately after the reception of the request EOF. To switch to the next slot, the VCD sends an EOF.

The following rules and restrictions apply:

● if no LRI2K answer is detected, the VCD may switch to the next slot by sending an EOF,

● if one or more LRI2K answers are detected, the VCD waits until the complete frame has been received before sending an EOF for switching to the next slot.

16   Request processing by the LRI2K

Upon reception of a valid request, the LRI2K performs the following algorithm:

● NbS is the total number of slots (1 or 16)
● SN is the current slot number (0 to 15)
● LSB (value, n) function returns the n Less Significant Bits of value
● MSB (value, n) function returns the n Most Significant Bits of value
● "&" is the concatenation operator
● Slot_Frame is either an SOF or an EOF

```
SN = 0
if (Nb_slots_flag)
   then NbS = 1
        SN_length = 0
        endif
   else NbS = 16
        SN_length = 4
        endif

label1:
if LSB(UID, SN_length + Mask_length) =
  LSB(SN,SN_length)&LSB(Mask,Mask_length)
  then answer to inventory request
        endif

wait (Slot_Frame)

if Slot_Frame = SOF
   then Stop Anticollision
        decode/process request
        exit
        endif

if Slot_Frame = EOF
   if SN < NbS-1
     then SN = SN + 1
          goto label1
          exit
          endif
   endif
```

17 Explanation of the possible cases

Figure 40 summarizes the main possible cases that can occur during an anticollision sequence when the slot number is 16.

The different steps are:

● The VCD sends an Inventory request, in a frame terminated by an EOF. The number of slots is 16.

● LRI2K 1 transmits its response in Slot 0. It is the only one to do so, therefore no collision occurs and its UID is received and registered by the VCD;

● The VCD sends an EOF in order to switch to the next slot.

● In slot 1, two LRI2Ks, LRI2K 2 and LRI2K 3 transmit a response, thus generating a collision. The VCD records the event and remembers that a collision was detected in Slot 1.

● The VCD sends an EOF in order to switch to the next slot.

● In Slot 2, no LRI2K transmits a response. Therefore the VCD does not detect any LRI2K SOF and decides to switch to the next slot by sending an EOF.

● In slot 3, there is another collision caused by responses from LRI2K 4 and LRI2K 5

● The VCD then decides to send a request (for instance a Read Block) to LRI2K 1 whose UID has already been correctly received.

● All LRI2Ks detect an SOF and exit the anticollision sequence. They process this request and since the request is addressed to LRI2K 1, only LRI2K 1 transmits a response.

● All LRI2Ks are ready to receive another request. If it is an Inventory command, the slot numbering sequence restarts from 0.

Note: The decision to interrupt the anticollision sequence is made by the VCD. It could have continued to send EOFs until Slot 16 and only then sent the request to LRI2K 1.

Figure 40. Description of a possible anticollision sequence
18 Inventory Initiated command

The LRI2K provides a special feature to improve the inventory time response of moving tags using the Initiate_flag value. This flag, controlled by the Initiate command, allows tags to answer to Inventory Initiated commands.

For applications in which multiple tags are moving in front of a reader, it is possible to miss tags using the standard inventory command. The reason is that the inventory sequence has to be performed on a global tree search. For example, a tag with a particular UID value may have to wait the run of a long tree search before being inventoried. If the delay is too long, the tag may be out of the field before it has been detected.

Using the Initiate command, the inventory sequence is optimized. When multiple tags are moving in front of a reader, the ones which are within the reader field will be initiated by the Initiate command. In this case, a small batch of tags will answer to the Inventory Initiated command which will optimize the time necessary to identify all the tags. When finished, the reader has to issue a new Initiate command in order to initiate a new small batch of tags which are new inside the reader field.

It is also possible to reduce the inventory sequence time using the Fast Initiate and Fast Inventory Initiated commands. These commands allow the LRI2Ks to increase their response data rate by a factor of 2, up to 53kbit/s.

19   Timing definition

19.1 t_1: LRI2K response delay

Upon detection of the rising edge of the EOF received from the VCD, the LRI2K waits for a time t_{1nom} before transmitting its response to a VCD request or before switching to the next slot during an inventory process. Values of t_1 are given in *Table 19*. The EOF is defined in *Figure 11 on page 18*.

19.2 t_2: VCD new request delay

t_2 is the time after which the VCD may send an EOF to switch to the next slot when one or more LRI2K responses have been received during an Inventory command. It starts from the reception of the EOF from the LRI2Ks.

The EOF sent by the VCD may be either 10% or 100% modulated regardless of the modulation index used for transmitting the VCD request to the LRI2K.

t_2 is also the time after which the VCD may send a new request to the LRI2K as described in *Table 37: LRI2K protocol timing*.

Values of t_2 are given in *Table 19*.

19.3 t_3: VCD new request delay in the absence of a response from the LRI2K

t_3 is the time after which the VCD may send an EOF to switch to the next slot when no LRI2K response has been received.

The EOF sent by the VCD may be either 10% or 100% modulated regardless of the modulation index used for transmitting the VCD request to the LRI2K.

From the time the VCD has generated the rising edge of an EOF:

● If this EOF is 100% modulated, the VCD waits a time at least equal to t_{3min} before sending a new EOF.

● If this EOF is 10% modulated, the VCD waits a time at least equal to the sum of t_{3min} + the LRI2K nominal response time (which depends on the LRI2K data rate and subcarrier modulation mode) before sending a new EOF.

Table 19.   Timing values[1]

	Minimum (min) values	Nominal (nom) values	Maximum (max) values
t_1	318.6 µs	320.9 µs	323.3 µs
t_2	309.2 µs	No t_{nom}	No t_{max}
t_3	t_{1max}[2] + t_{SOF}[3]	No t_{nom}	No t_{max}

1. *The tolerance of specific timings is ± 32/f_C.*

2. t_{1max} does not apply for write alike requests. Timing conditions for write alike requests are defined in the command description.

3. t_{SOF} is the time taken by the LRI2K to transmit an SOF to the VCD. t_{SOF} depends on the current data rate: High data rate or Low data rate.

20 Commands codes

The LRI2K supports the commands described in this section. Their codes are given in *Table 20*.

Table 20. Command codes

Command code standard	Function		Command code custom	Function
01h	Inventory		A6h	Kill
02h	Stay Quiet		B1h	Write Kill
20h	Read Single Block		B2h	Lock Kill
21h	Write Single Block		C0h	Fast Read Single Block
22h	Lock Block		C1h	Fast Inventory Initiated
23h	Read Multiple Block		C2h	Fast Initiate
25h	Select		C3h	Fast Read Multiple Block
26h	Reset to Ready		D1h	Inventory Initiated
27h	Write AFI		D2h	Initiate
28h	Lock AFI			
29h	Write DSFID			
2Ah	Lock DSFID			
2Bh	Get System Info			
2Ch	Get Multiple Block Security Status			

20.1   Inventory

When receiving the Inventory request, the LRI2K runs the anticollision sequence. The Inventory_flag is set to 1. The meaning of flags 5 to 8 is shown in *Table 13: Request flags 5 to 8 when bit 3 = 1*.

The request contains:

●   the flags,
●   the Inventory command code (see *Table 20: Command codes*)
●   the AFI if the AFI flag is set
●   the mask length
●   the mask value
●   the CRC

The LRI2K does not generate any answer in case of error.

Table 21.   Inventory request format

Request SOF	Request flags	Inventory	Optional AFI	Mask length	Mask value	CRC16	Request EOF
	8 bits	01h	8 bits	8 bits	0 - 64 bits	16 bits	

The response contains:

●   the flags
●   the Unique ID

Table 22.   Inventory response format

Response SOF	Response flags	DSFID	UID	CRC16	Response EOF
	8 bits	8 bits	64 bits	16 bits	

During an Inventory process, if the VCD does not receive an RF LRI2K response, it waits a time t_3 before sending an EOF to switch to the next slot. t_3 starts from the rising edge of the request EOF sent by the VCD.

●   If the VCD sends a 100% modulated EOF, the minimum value of t_3 is:
       $t_3 min = 4384/f_C$ (323.3µs) + t_{SOF}
●   If the VCD sends a 10% modulated EOF, the minimum value of t_3 is:
       $t_3 min = 4384/f_C$ (323.3µs) + t_{NRT}

where:

● t_{SOF} is the time required by the LRI2K to transmit an SOF to the VCD
● t_{NRT} is the nominal response time of the LRI2K

t_{NRT} and t_{SOF} are dependent on the LRI2K-to-VCD data rate and subcarrier modulation mode.

20.2 Stay Quiet

On receiving the Stay Quiet command, the LRI2K enters the Quiet state and does NOT send back a response. There is NO response to the Stay Quiet command even if an error occurs.

When in the Quiet state:
● the LRI2K does not process any request if the Inventory_flag is set,
● the LRI2K processes any Addressed request

The LRI2K exits the Quiet state when:
● it is reset (power off),
● receiving a Select request. It then goes to the Selected state,
● receiving a Reset to Ready request. It then goes to the Ready state.

Table 23. Stay Quiet request format

Request SOF	Request flags	Stay Quiet	UID	CRC16	Request EOF
	8 bits	02h	64 bits	16 bits	

The Stay Quiet command must always be executed in the Addressed mode (Select_flag is reset to 0 and Address_flag is set to 1).

Figure 41. Stay Quiet frame exchange between VCD and LRI2K
20.3   Read Single Block

On receiving the Read Single Block command, the LRI2K reads the requested block and sends back its 32 bits value in the response. The Option_flag is supported.

Table 24.   Read Single Block request format

Request SOF	Request_flags	Read Single Block	UID	Block number	CRC16	Request EOF
	8 bits	20h	64 bits	8 bits	16 bits	

Request parameters:

● Option_flag

● UID (Optional)

● Block number

Table 25.   Read Single Block response format when Error_flag is NOT set

Response SOF	Response_flags	Block locking status	Data	CRC16	Response EOF
	8 bits	8 bits	32 bits	16 bits	

Response parameter:

● Block Locking Status if Option_flag is set (see *Table 26: Block Locking status*)

● 4 bytes of block data

Table 26.   Block Locking status

b_7	b_6	b_5	b_4	b_3	b_2	b_1	b_0

Table 27.   Read Single Block response format when Error_flag is set

Response SOF	Response_Flags	Error code	CRC16	Response EOF
	8 bits	8 bits	16 bits	

Response parameter:

● Error code as Error_flag is set:

– 0Fh: other error

– 10h: block address not available

Figure 42. READ Single Block frame exchange between VCD and LRI2K
20.4 Write Single Block

On receiving the Write Single Block Command, the LRI2K writes the data contained in the request to the requested block and reports whether the write operation was successful in the response. The Option_flag is supported.

During the write cycle t_W, there should be no modulation (neither 100% nor 10%). Otherwise, the LRI2K may not program correctly the data into the memory. The t_W time is equal to $t_{1nom} + 18 \times 302\mu s$.

Table 28. Write Single Block request format

Request SOF	Request_flags	Write Single Block	UID	Block number	Data	CRC16	Request EOF
	8 bits	21h	64 bits	8 bits	32 bits	16 bits	

Request parameters:

● UID (Optional)

● Block number

● Data

Table 29. Write Single Block response format when Error_flag is NOT set

Response SOF	Response_flags	CRC16	Response EOF
	8 bits	16 bits	

Response parameter:

● No parameter. The response is sent back after the write cycle.

Table 30. Write Single Block response format when Error_flag is set

Response SOF	Response_flags	Error code	CRC16	Response EOF
	8 bits	8 bits	16 bits	

Response parameter:

● Error code as Error_flag is set:

– 10h: block address not available

– 12h: block is locked

– 13h: block not programmed

Figure 43. Write Single Block frame exchange between VCD and LRI2K
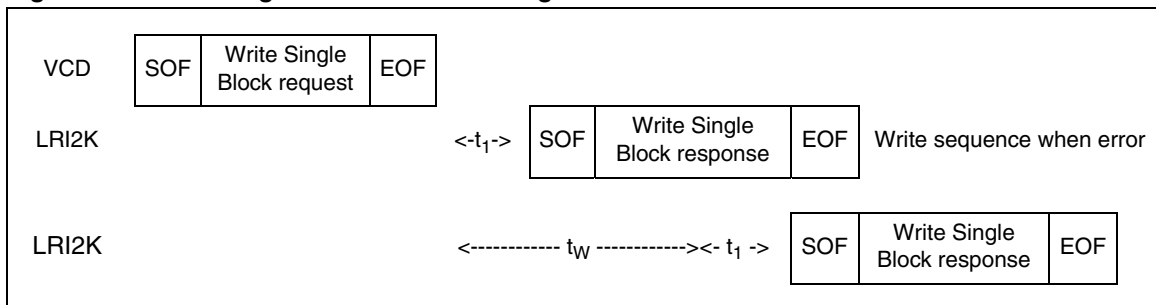

20.5 Lock Block

On receiving the Lock Block command, the LRI2K permanently locks the selected block. The Option_flag is supported.

During the write cycle t_W, there should be no modulation (neither 100% nor 10%). Otherwise, the LRI2K may not lock correctly the memory block. The t_W time is equal to t_{1nom} + 18 × 302µs.

Table 31. Lock Single Block request format

Request SOF	Request_flags	Lock Block	UID	Block number	CRC16	Request EOF
	8 bits	22h	64 bits	8 bits	16 bits	

Request parameters:
- (Optional) UID
- Block number

	8 bits	16 bits	

Response parameter:
- No parameter.

Table 33. Lock Block response format when Error_flag is set

Response SOF	Response_flags	Error code	CRC16	Response EOF
	8 bits	8 bits	16 bits	

Response parameter:
- Error code as Error_flag is set:
  – 10h: block address not available
  – 11h: block is locked
  – 14h: block not locked

Figure 44. Lock Block frame exchange between VCD and LRI2K
20.6   Read Multiple Block

When receiving the Read Multiple Block command, the LRI2K reads the selected blocks and sends back their value in multiples of 32 bits in the response. The blocks are numbered from '00 to '3F' in the request and the value is minus one (–1) in the field. For example, if the "number of blocks" field contains the value 06h, 7 blocks will be read. The maximum number of blocks is fixed at 64. During Sequential Block Read, when the block address reaches 64, it rolls over to 0. The Option_flag is supported.

Table 34.   Read Multiple Block request format

Request SOF	Request_ flags	Read Multiple Block	UID	First block number	Number of blocks	CRC16	Request EOF
	8 bits	23h	64 bits	8 bits	8 bits	16 bits	

Request parameters:

● Option_flag

● UID (Optional)

● First block number

● Number of blocks

Table 35.   Read Multiple Block response format when Error_flag is NOT set

Response SOF	Response_ flags	Block Locking Status	Data	CRC16	Response EOF
	8 bits	8 bits[1]	32 bits[1]	16 bits	

1. Repeated as needed.

Response parameter:

● Block Locking Status if Option_flag is set (see *Table 36: Block Locking status*)

● N blocks of data

Table 36.   Block Locking status

b$_7$	b$_6$	b$_5$	b$_4$	b$_3$	b$_2$	b$_1$	b$_0$
All 0							0: Current Block not locked 1: Current Block locked

Table 37.   Read Multiple Block response format when Error_flag is set

Response SOF	Response_flags	Error code	CRC16	Response EOF
	8 bits	8 bits	16 bits	

Response parameter:

● Error code as Error_flag is set:

   – 0Fh: other error

   – 10h: block address not available

Figure 45.   Read Multiple Block frame exchange between VCD and LRI2K
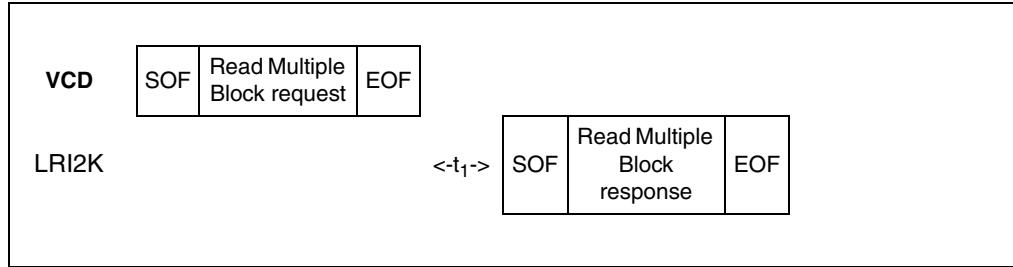

20.7   Select

When receiving the Select command:

● if the UID is equal to its own UID, the LRI2K enters or stays in the Selected state and sends a response.

● if the UID does not match its own, the selected LRI2K returns to the Ready state and does not send a response.

The LRI2K answers an error code only if the UID is equal to its own UID. If not, no response is generated.

Table 38.   Select request format

Request SOF	Request_flags	Select	UID	CRC16	Request EOF
	8 bits	25h	64 bits	16 bits	

Request parameter:

● UID

Response SOF	Response_flags	Error code	CRC16	Response EOF
	8 bits	8 bits	16 bits	

Response parameter:

● Error code as Error_flag is set:
  – 0Fh: other error

Figure 47.   Reset to Ready frame exchange between VCD and LRI2K
20.9   Write AFI

On receiving the Write AFI request, the LRI2K writes the AFI byte value into its memory. The Option_flag is supported.

During the write cycle t_W, there should be no modulation (neither 100% nor 10%). Otherwise, the LRI2K may not write correctly the AFI value into the memory. The t_W time is equal to $t_{1nom} + 18 \times 302\mu s$.

Table 44.   Write AFI request format

    - 12h: block is locked
    - 13h: block not programmed

Figure 48.   Write AFI frame exchange between VCD and LRI2K
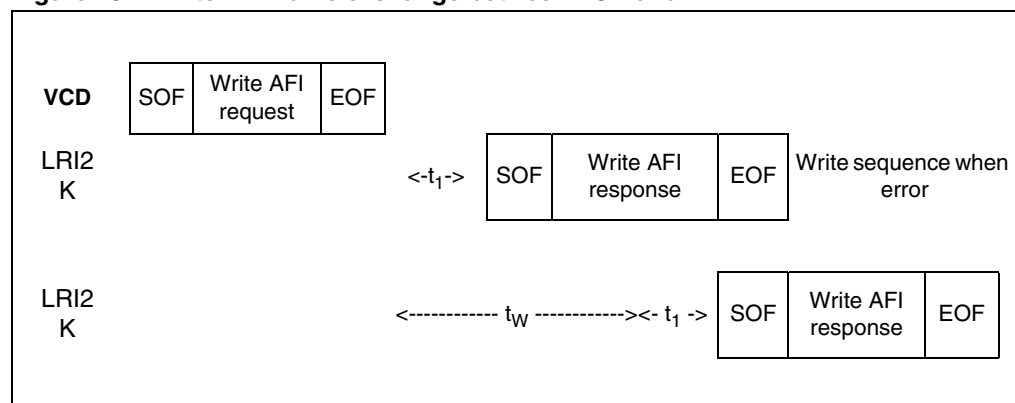

20.10 Lock AFI

On receiving the Lock AFI request, the LRI2K locks the AFI value permanently. The Option_flag is supported.

During the write cycle t_W, there should be no modulation (neither 100% nor 10%). Otherwise, the LRI2K may not Lock correctly the AFI value in memory. The t_W time is equal to $t_{1nom} + 18 \times 302$ µs.

  - 14h: block not locked

Figure 49.   Lock AFI frame exchange between VCD and LRI2K
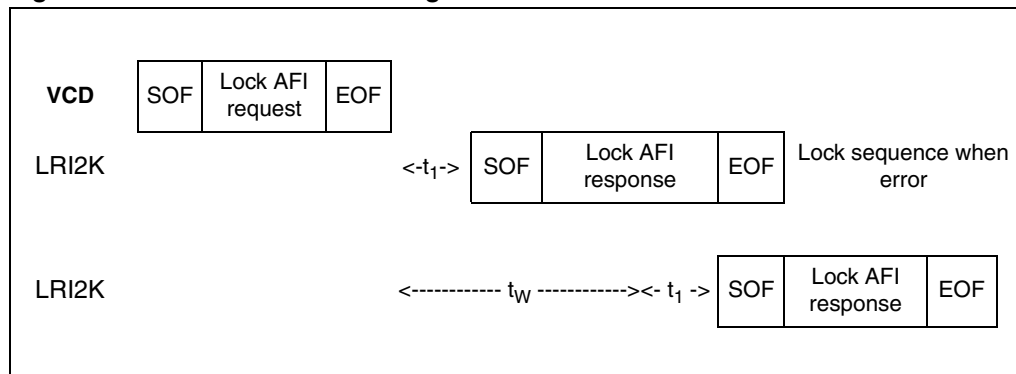

20.11   Write DSFID

On receiving the Write DSFID request, the LRI2K writes the DSFID byte value into its memory. The Option_flag is supported.

During the write cycle t_W, there should be no modulation (neither 100% nor 10%). Otherwise, the LRI2K may not write correctly the DSFID value in memory. The t_W time is equal to $t_{1nom} + 18 \times 302$µs.

  – 0Fh: other error

Figure 52.   Get System Info frame exchange between VCD and LRI2K
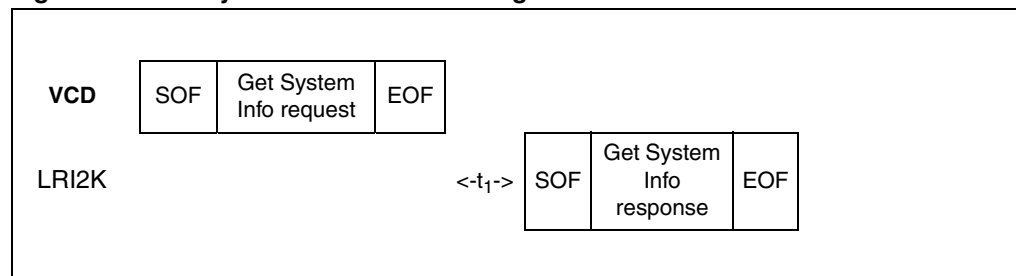

20.14 Get Multiple Block Security Status

When receiving the Get Multiple Block Security Status command, the LRI2K sends back the block security status. The blocks are numbered from '00 to '3F' in the request and the value is minus one (−1) in the field. For example, a value of '06' in the "Number of blocks" field requests to return the security status of 7 Blocks.

Table 59.   Get Multiple Block Security Status request format

Request SOF	Request_ flags	Get Multiple Block Security Status	UID	First block number	Number of blocks	CRC16	Request EOF
	8 bits	2Ch	64 bits	8 bits	8 bits	16 bits	

Request parameters:
- UID (Optional)
- First block number
- Number of blocks

Table 60.   Get Multiple Block Security Status response format when Error_flag is NOT set

Response SOF	Response_flags	Block Locking Status	CRC16	Response EOF

Figure 53.   Get Multiple Block Security Status frame exchange between VCD and LRI2K
20.15 Kill

On receiving the Kill command, in the Addressed mode only, the LRI2K compares the kill code with the data contained in the request and reports whether the operation was successful in the response. The Option_flag is supported. If the command is received in the Non Addressed or the Selected mode, the LRI2K returns an error response.

During the comparison cycle equal to t_W, there should be no modulation (neither 100% nor 10%). Otherwise, the LRI2K may not match the kill code correctly. The t_W time is equal to $t_{1nom} + 18 \times 302\mu s$. After a successful Kill command, the LRI2K is deactivated and does not interpret any other command.

Table 63.   Kill request format

Request SOF	Request_ flags	Kill	IC Mfg code	UID	Kill access	Kill code	CRC16	Request EOF
	8 bits	A6h	02h	64 bits	00h	32 bits	16 bits

Response parameter:
- Error code as Error_flag is set:
  - 0Fh: other error
  - 14h: block not locked

Figure 54.   Kill frame exchange between VCD and LRI2K
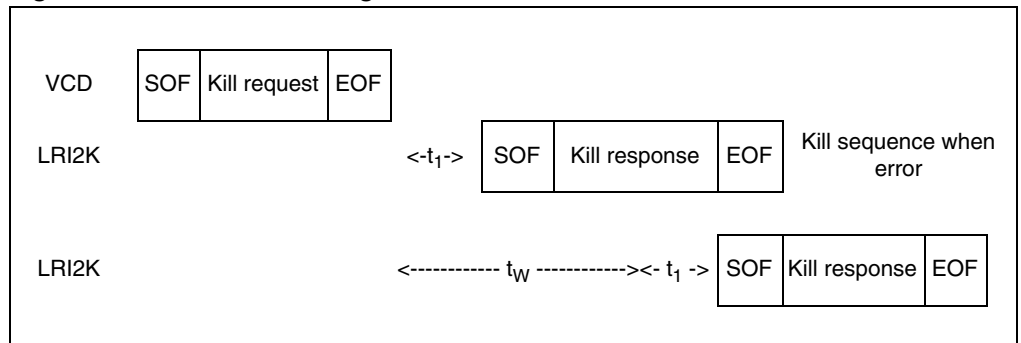

20.16   Write Kill

On receiving the Write Kill command, the LRI2K writes the kill code with the data contained in the request and reports whether the operation was successful in the response. The Option_flag is supported. After a successful write, the kill code must be locked by a Lock Kill command to activate the protection.

During the write cycle t_W, there should be no modulation (neither 100% nor 10%). Otherwise, the LRI2K may not correctly program the data to the memory. The t_W time is equal to $t_{1nom} + 18 \times 302$ µs.

Table 66.   Write Kill request format

Request SOF	Request_ flags	Write Kill	IC Mfg code	UID	Kill access	Kill code	CRC16	Request EOF
	8 bits	B1h	02h	64 bits	00h	32 bits	16 bits	

Request parameters:

● UID (Optional)
● Kill Address (00h = Kill, other = Error)
● Data

Table 67.   Write Kill response format when Error_flag is NOT set

Response SOF	Response_flags	CRC16	Response EOF

No parameter. The response is send back after the write cycle.

Table 68.   Write Kill response format when Error_flag is set

Response SOF	Response_flags	Error code	CRC16	Response EOF
	8 bits	8 bits	16 bits	

Response parameter:

● Error code as Error_flag is set:
  – 10h: block address not available
  – 12h: block is locked
  – 13h: block not programmed

Figure 55.   Write Kill frame exchange between VCD and LRI2K
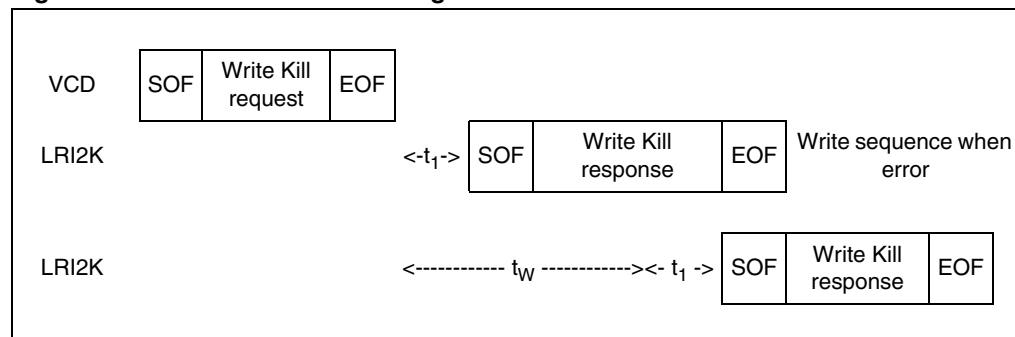

20.17 Lock Kill

On receiving the Lock Kill command, the LRI2K locks the Kill code permanently. The Option_flag is supported. RFU bit 8 of the request flag must be set to '1'.

During the write cycle t_W, there should be no modulation (neither 100% nor 10%). Otherwise, the LRI2K may not lock the memory block correctly. The t_W time is equal to $t_{1nom} + 18 \times 302$ μs.

– 0Fh: other error

– 10h: block address not available

Figure 57. Fast Read Single Block frame exchange between VCD and LRI2K
20.19 Fast Inventory Initiated

Before receiving the Fast Inventory Initiated command, the LRI2K must have received an Initiate or a Fast Initiate command in order to set the Initiate_ flag. If not, the LRI2K does not answer to the Fast Inventory Initiated command.

On receiving the Fast Inventory Initiated request, the LRI2K runs the anticollision sequence. The Inventory_flag must be set to 1. The Meaning of Flags 5 to 8 is shown in *Table 13: Request flags 5 to 8 when bit 3 = 1*. The data rate of the response is multiplied by 2.

The request contains:

- the flags,
- the Inventory command code
- the AFI if the AFI flag is set
- the mask length
- the mask value
- the CRC

The LRI2K does not generate any answer if an error occurs.

Table 76.   Fast Inventory Initiated request format

Request SOF	Request Flags	Fast Inventory Initiated	IC Mfg Code	Optional AFI	Mask length	Mask value	CRC16	Request EOF
	8 bits	C1h	02h	8 bits	8 bits	0 - 64 bits	16 bits	

The response contains:

- The flags
- the Unique ID

Table 77.   Fast Inventory Initiated response format

Response SOF	Response Flags	DSFID	UID	CRC16	Response EOF
	8 bits	00h	64 bits	16 bits	

During an Inventory process, if the VCD does not receive an RF LRI2K response, it waits a time t_3 before sending an EOF to switch to the next slot. t_3 starts from the rising edge of the request EOF sent by the VCD.

- If the VCD sends a 100% modulated EOF, the minimum value of t_3 is:
  $t_3min = 4384/f_C$ (323.3 µs) + t_{SOF}
- If the VCD sends a 10% modulated EOF, the minimum value of t_3 is:
  $t_3min = 4384/f_C$ (323.3 µs) + t_{NRT}

where:

- t_{SOF} is the time required by the LRI2K to transmit an SOF to the VCD
- t_{NRT} is the nominal response time of the LRI2K

t_{NRT} and t_{SOF} are dependent on the LRI2K-to-VCD data rate and subcarrier modulation mode.

20.20 Fast Initiate

On receiving the Fast Initiate command, the LRI2K sets the internal Initiate_flag and sends back a response. The command has to be issued in the Non Addressed mode only (Select_flag is reset to 0 and Address_flag is reset to 0). If an error occurs, the LRI2K does not generate any answer. The Initiate_flag is reset after a power off of the LRI2K. The data rate of the response is multiplied by 2.

The request contains:

● No data

Table 78. Fast Initiate request format

Request SOF	Request Flags	Fast Initiate	IC Mfg code	CRC16	Request EOF
	8 bits	C2h	02h	16 bits	

The response contains:

● the flags
● the Unique ID

Table 79. Fast Initiate response format

Response SOF	Response_flags	DSFID	UID	CRC16	Response EOF
	8 bits	00h	64 bits	16 bits	

Figure 58. Fast Initiate frame exchange between VCD and LRI2K
20.21 Fast Read Multiple Block

On receiving the Fast Read Multiple Block command, the LRI2K reads the requested blocks and sends back their value in multiples of 32 bits in the response. The blocks are numbered from '00' to '3F' in the request and the value is minus one (–1) in the field. For example, a value 06h in the "number of blocks" field causes the LRI2K to read 7 blocks. The maximum number of blocks is fixed at 64. During Sequential Block Read, when the block address reaches 64, it rolls over to 0. The Option_flag is supported. The data rate of the response is multiplied by 2.

Table 80.   Fast Read Multiple Block request format

Request SOF	Request_ flags	Fast Read Multiple Block	IC Mfg code	UID	First block number	Number of blocks	CRC16	Request EOF
	8 bits	C3h	02h	64 bits	8 bits	8 bits	16 bits	

Request parameters:

- Option_flag
- UID (Optional)
- First block number
- Number of blocks

  - 0Fh: other error
  - 10h: block address not available

Figure 59.   Fast Read Multiple Block frame exchange between VCD and LRI2K
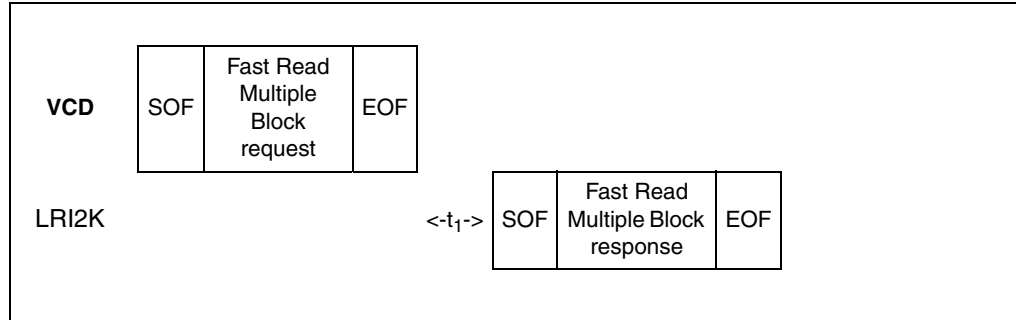

20.22 Inventory Initiated

Before receiving the Inventory Initiated command, the LRI2K must have received an Initiate or a Fast Initiate command in order to set the Initiate_ flag. If not, the LRI2K does not answer to the Inventory Initiated command.

On receiving the Inventory Initiated request, the LRI2K runs the anticollision sequence. The Inventory_flag must be set to 1. The Meaning of Flags 5 to 8 is given in *Table 13: Request flags 5 to 8 when bit 3 = 1*.

The request contains:

● the flags,
● the Inventory command code
● the AFI if the AFI flag is set
● the mask length
● the mask value
● the CRC

The LRI2K does not generate any answer if an error occurs.

Table 84.   Inventory Initiated request format

Request SOF	Request Flags	Inventory Initiated	IC Mfg code	Optional AFI	Mask length	Mask value	CRC16	Request EOF
	8 bits	D1h	02h	8 bits	8 bits	0 - 64 bits	16 bits	

The response contains:

● the flags
● the Unique ID

Table 85.   Inventory Initiated response format

Response SOF	Response Flags	DSFID	UID	CRC16	Response EOF
	8 bits	00h	64 bits	16 bits	

During an Inventory process, if the VCD does not receive an RF LRI2K response, it waits a time t_3 before sending an EOF to switch to the next slot. t_3 starts from the rising edge of the request EOF sent by the VCD.

● If the VCD sends a 100% modulated EOF, the minimum value of t_3 is:
  $t_3min = 4384/f_C$ (323.3 µs) $+ t_{SOF}$
● If the VCD sends a 10% modulated EOF, the minimum value of t_3 is:
  $t_3min = 4384/f_C$ (323.3 µs) $+ t_{NRT}$

where:

● t_{SOF} is the time required by the LRI2K to transmit an SOF to the VCD
● t_{NRT} is the nominal response time of the LRI2K

t_{NRT} and t_{SOF} are dependent on the LRI2K-to-VCD data rate and subcarrier modulation mode.

20.23 Initiate

On receiving the Initiate command, the LRI2K sets the internal Initiate_flag and sends back a response. The command has to be issued in the Non Addressed mode only (Select_flag is reset to 0 and Address_flag is reset to 0). If an error occurs, the LRI2K does not generate any answer. The Initiate_flag is reset after a power off of the LRI2K.

21 Maximum rating

Stressing the device above the rating listed in the absolute maximum ratings table may cause permanent damage to the device. These are stress ratings only and operation of the device at these or any other conditions above those indicated in the operating sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability. Refer also to the STMicroelectronics SURE Program and other relevant quality documents.

Table 88.   Absolute maximum ratings

Symbol	Parameter		Min.	Max.	Unit

22   DC and AC parameters

This section summarizes the operating and measurement conditions, and the DC and AC characteristics of the device. The parameters in the DC and AC Characteristic tables that follow are derived from tests performed under the Measurement Conditions summarized in the relevant tables. Designers should check that the operating conditions in their circuit match the measurement conditions when relying on the quoted parameters.

Table 89.   AC characteristics[1] [2]

Symbol	Parameter	Condition	Min	Typ	Max	Unit
f_{CC}	External RF signal frequency		13.553	13.56	13.567	MHz
$MI_{CARRIER}$	10% carrier modulation index	MI=(A-B)/(A+B)	10		30	%
t_{RFR}, t_{RFF}	10% rise and fall time		0.5		3.0	μs
t_{RFSBL}	10% minimum pulse width for bit		7.1		9.44	μs
$MI_{CARRIER}$	100% carrier modulation index	MI=(A-B)/(A+B)	95		100	%
t_{RFR}, t_{RFF}	100% rise and fall time		0.5		3.5	μs
t_{RFSBL}	100% minimum pulse width for bit		7.1		9.44	μs
t_{JIT}	Bit pulse jitter		−2		+2	μs
$t_{MIN\ CD}$	Minimum time from carrier generation to first data	From H-field min		0.1	1	ms
f_{SH}	Subcarrier frequency high	$F_{CC}/32$		423.75		kHz
f_{SL}	Subcarrier frequency low	$F_{CC}/28$		484.28		kHz
t_1	Time for LRI2K response	$4224/F_S$	318.6	320.9	323.3	μs
t_2	Time between command	$4224/F_S$	309	311.5	314	μs
t_W	Programming time				5.8	ms

1. T_A = −20 to 85°C.

2.   All timing measurements were performed on a reference antenna with the following characteristics:
      External size: 75 mm x 48 mm
      Number of turns: 6
      Width of conductor: 1 mm
      Space between 2 conductors: 0.4 mm
      Value of the tuning capacitor: 28.5 pF (LRI2K-W4)
      Value of the coil: 4.3 μH
      Tuning frequency: 13.8 MHz.

Table 90.   DC characteristics[1]

Symbol	Parameter		Test conditions	Min.	Typ.	Max.	Unit

23   Package mechanical data

In order to meet environmental requirements, ST offers these devices in ECOPACK®
packages. These packages have a Lead-free second-level interconnect. The category of
second-level interconnect is marked on the package and on the inner box label, in
compliance with JEDEC Standard JESD97.
The maximum ratings related to soldering conditions are also marked on the inner box label.
ECOPACK is an ST trademark. ECOPACK specifications are available at: *www.st.com*.

1.   Values in inches are converted from mm and rounded to 4 decimal digits.

2.   Applied for exposed die paddle and terminals. Exclude embedding part of exposed die paddle from
measuring.

24 Part numbering

Table 93. Ordering information scheme

Example: LRI2K - W4 / 2 GE

Device type

LRI2K

Package

W4 =180 μm ± 15 μm unsawn wafer

SBN18 = 180 μm ± 15 μm bumped and sawn wafer on 8-inch frame

MBTG = UFDFPN8 (MLP8), tape & reel packing, ECOPACK®, lead-free, RoHS compliant, Sb_2O_3-free and TBBA-free

Tuning capacitance

1 = 21 pF

2 = 28.5 pF

3 = 97 pF

4 = 23 pF

Customer code given by ST

GE = generic product

xx = customer code after personalization

For further information on any aspect of this device, please contact your nearest ST sales office.

Appendix A   Anticollision algorithm (Informative)

The following pseudocode describes how anticollision could be implemented on the VCD, using recursivity.

A.1   Algorithm for pulsed slots

```
function push (mask, address); pushes on private stack

function pop (mask, address); pops from private stack

function pulse_next_pause; generates a power pulse

function store(LRI2K_UID); stores LRI2K_UID

function poll_loop (sub_address_size as integer)
  pop (mask, address)
  mask = address & mask; generates new mask
            ; send the request
  mode = anticollision
  send_request (Request_cmd, mode, mask length, mask value)
  for sub_address = 0 to (2^sub_address_size - 1)
    pulse_next_pause
    if no_collision_is_detected ; LRI2K is inventoried
      then
        store (LRI2K_UID)
      else ; remember a collision was detected
        push(mask,address)
      endif
    next sub_address

  if stack_not_empty ; if some collisions have been detected and
    then   ; not yet processed, the function calls itself
      poll_loop (sub_address_size); recursively to process the
last stored collision
    endif
end poll_loop

main_cycle:
  mask = null
  address = null
  push (mask, address)
  poll_loop(sub_address_size)
end_main_cycle
```

Appendix B   CRC (Informative)

B.1   CRC error detection method

The cyclic redundancy check (CRC) is calculated on all data contained in a message, from the start of the Flags through to the end of Data. The CRC is used from VCD to LRI2K and from LRI2K to VCD.

Table 94.   CRC definition

CRC definition					
CRC type	**Length**	**Polynomial**	**Direction**	**Preset**	**Residue**
ISO/IEC 13239	16 bits	$X^{16} + X^{12} + X^5 + 1 = 8408h$	Backward	FFFFh	F0B8h

To add extra protection against shifting errors, a further transformation on the calculated CRC is made. The one's complement of the calculated CRC is the value attached to the message for transmission.

To check received messages the 2 CRC bytes are often also included in the re-calculation, for ease of use. In this case, the expected value for the generated CRC is the residue F0B8h.

B.2   CRC calculation example

This example in C language illustrates one method of calculating the CRC on a given set of bytes comprising a message.

C-Example to calculate or check the CRC16 according to ISO/IEC 13239

```
#define   POLYNOMIAL8408h//  x^16 + x^12 + x^5 + 1
#define   PRESET_VALUEFFFFh
#define   CHECK_VALUEF0B8h

#define   NUMBER_OF_BYTES4// Example: 4 data bytes
#define   CALC_CRC1
#define   CHECK_CRC0

void main()
{
  unsigned int  current_crc_value;
  unsigned char array_of_databytes[NUMBER_OF_BYTES + 2] = {1, 2, 3,
4, 91h, 39h};
  int          number_of_databytes = NUMBER_OF_BYTES;
  int          calculate_or_check_crc;
  int          i, j;
  calculate_or_check_crc = CALC_CRC;
// calculate_or_check_crc = CHECK_CRC;// This could be an other
example
  if (calculate_or_check_crc == CALC_CRC)
  {
      number_of_databytes = NUMBER_OF_BYTES;
```

```
    }
    else    // check CRC
    {
        number_of_databytes = NUMBER_OF_BYTES + 2;
    }

    current_crc_value = PRESET_VALUE;

    for (i = 0; i < number_of_databytes; i++)
    {
        current_crc_value = current_crc_value ^ ((unsigned
int)array_of_databytes[i]);

        for (j = 0; j < 8; j++)
        {
            if (current_crc_value & 0001h)
            {
                current_crc_value = (current_crc_value >> 1) ^
POLYNOMIAL;
            }
            else
            {
                current_crc_value = (current_crc_value >> 1);
            }
        }
    }

    if (calculate_or_check_crc == CALC_CRC)
    {
        current_crc_value = ~current_crc_value;

        printf ("Generated CRC is 0x%04X\n", current_crc_value);

        // current_crc_value is now ready to be appended to the data
stream
        // (first LSByte, then MSByte)
    }
    else    // check CRC
    {
        if (current_crc_value == CHECK_VALUE)
        {
            printf ("Checked CRC is ok (0x%04X)\n",
current_crc_value);
        }
        else
        {
            printf ("Checked CRC is NOT ok (0x%04X)\n",
current_crc_value);
        }
    }
}
```

B.3 Application family identifier (AFI) (informative)

The AFI (application family identifier) represents the type of application targeted by the VCD and is used to extract from all the LRI2K present only the LRI2K meeting the required application criteria.

It is programmed by the LRI2K issuer (the purchaser of the LRI2K). Once locked, it cannot be modified.

The most significant nibble of the AFI is used to code one specific or all application families, as defined in *Table 95*.

The least significant nibble of the AFI is used to code one specific or all application subfamilies. Subfamily codes different from 0 are proprietary.

Table 95.   AFI coding[1]

AFI most significant nibble	AFI least significant nibble	Meaning VICCs respond from	Examples / Note
'0'	'0'	All families and subfamilies	No applicative preselection
'X'	'0	'All subfamilies of family X	Wide applicative preselection
'X	"Y'	Only the Yth subfamily of family X	
'0'	'Y'	Proprietary subfamily Y only	
'1	"0', 'Y'	Transport	Mass transit, Bus, Airline etc.
'2	"0', 'Y'	Financial	IEP, Banking, Retail etc.
'3	"0', 'Y'	Identification	Access Control etc.
'4	"0', 'Y'	Telecommunication	Public Telephony, GSM etc.
'5'	'0', 'Y'	Medical	
'6	"0', 'Y'	Multimedia	Internet services etc.
'7	"0', 'Y'	Gaming	
8	"0', 'Y'	Data storage	Portable Files etc.
'9	"0', 'Y'	Item management	
'A	"0', 'Y'	Express parcels	
'B	"0', 'Y'	Postal services	
'C	"0', 'Y'	Airline bags	
'D	"0', 'Y'	RFU	
'E	"0', 'Y'	RFU	
'F'	'0', 'Y'	RFU	

1. X = '1' to 'F', Y = '1' to 'F.

Revision history

Table 96.   Document revision history

Date	Revision	Changes
17-Feb-2006	1	Initial release.
08-Feb-2007	2	*Figure 2: UFDFPN8 (MLP) connections* added. Only bits set to '1' are programmed to the AFI and DSFID Registers (see *Section 20.9: Write AFI* and *Section 20.11: Write DSFID*. C$_{TUN}$ typical value for W4/3 modified in *Table 90: DC characteristics*. Small text changes.
15-Jun-2007	3	*Section 20.9: Write AFI* and *Section 20.11: Write DSFID* modified.
20-Jul-2007	4	Document status promoted from Preliminary Data to full Datasheet. Small text changes.
31-Aug-2007	5	23.5 pF internal tuning capacitor (C$_{TUN}$) value added (see *Features on page 1* and *Table 90: DC characteristics*. V$_{ESD}$ max modified for MLP in *Table 88: Absolute maximum ratings*.
07-Sep-2007	6	V$_{ESD}$ min modified for MLP in *Table 88: Absolute maximum ratings*.
08-Apr-2008	7	Response parameters modified in *Section 20.14: Get Multiple Block Security Status on page 62*. UFDFPN8 package mechanical data updated and dimensions in inches rounded to four decimal digits instead of three in *Table 92: UFDFPN8 - 8-lead ultra thin fine pitch dual flat package no lead (MLP) mechanical data*.
16-Sep-2008	8	LRI2K products are no longer offered in A1 inlays and A6 and A7 antennas. T$_{STG}$ added for UFDPFN8 package in *Table 88: Absolute maximum ratings*. *Table 93: Ordering information scheme* clarified.
