high efficiency red SCD5582 green SCD5583
high efficiency green SCD5584

## FEATURES

- Eight 0.145" ( 3.68 mm ) $5 \times 5$ dot matrix characters in red, yellow, high efficiency red, green, or high efficiency green
- Optimum display surface efficiency (display area to package ratio)
- Low power-30\% less power dissipation than 5x7 format
- High speed data input rate: $5 \mathbf{~ M H z}$
- ROMless serial input, dot addressable dis-play-ideal for user defined characters
- Built-in decoders, multiplexers and LED drivers
- Readable from 6 feet ( 1.8 meters)
- Wide viewing angle, $X$ axis $\pm 55^{\circ}, Y$ axis $\pm 65^{\circ}$
- Attributes
- 200 bit RAM for user defined characters
- Eight dimming levels
- Power down mode (<250 mW)
- Hardware/software clear function
- Lamp test
- Internal or external clock
- End-stackable dual-in-line plastic package
- 3.3 V capability

## DESCRIPTION

The SCD5580 (Red), SCD5581 (Yellow), SCD5582 (HER), SCD5583 (Green) and SCD5584 (HEG) are eight digit dot addressable $5 \times 5$ matrix, Serial Input, Intelligent Displays.
The eight 0.145 " ( 3.68 mm ) high digits are packaged in a rugged, high quality optically transparent, standard 0.3 " pin spacing 28 pin plastic DIP.
The on-board CMOS has a 200 bit RAM, one bit associated with one LED, each to generate User Defined Characters. Due to the reduced LED count, power requirement and heat dissipation are reduced by $30 \%$. Additionally in Power Down Mode quiescent current is $<50 \mu \mathrm{~A}$.
The SCD558X is designed to work with the Serial port of most common microprocessors. The multiplex Clock I/O (CLK I/O) and multiplex Clock Select (CLK SEL) pins offer the user the capability to supply a high speed external multiplex clock. This feature can minimize audio in-band interference for portable communication equipment or eliminate the visual synchronization effects found in high vibration environments such as avionic equipment

Maximum Ratings
DC Supply Voltage ........................................................-0.5 to + 7.0 Vdc Input Voltage Levels Relative

Relative Humidity at $85^{\circ} \mathrm{C}$.................................................................. 85\%
Maximum Number of LEDs on at 100\% Brightness ............................ 128
Maximum Power Dissipation .....................................................1.7 Watts
IC Junction Temperature ................................................................. $125^{\circ} \mathrm{C}$
ESD (100 pF, 1.5 K $\Omega$ )......................................................................... 2 KV
Maximum Input Current ............................................................. $\pm 100$ mA.

Notes:

1. Peak current $=5 / 3 \times \mathrm{I}_{\mathrm{CC}}$.
2. Unused inputs must be tied high.
3. Contact Siemens for 3.3 volt operation.
4. External oscillator must be stopped if being used to maintain an $\mathrm{I}_{\mathrm{CC}}<50 \mu$

## Input/Output Circuits

Figures 3 and 4 show the input and output resistor/diode networks used for ESD protection and to eliminate substrate latch-up caused by input voltage over/under shoot.A.

## Operation of the SCD558X

The SCD558X display consists of a CMOS IC containing control logic and drivers for eight $5 \times 5$ characters. These components are assembled in a compact ( $38 \mathrm{~mm} \times 10 \mathrm{~mm}$ ) plastic package.

Individual LED dot addressablity allows the user great freedom in creating special characters or mini-icons. The User Definable Character Set Examples illustrate 200 different character and symbol possibilities.

The use of a serial data interface provides a highly efficient interconnection between the display and the mother board.

The SCD558X requires only 4 lines as compared to 15 for an equivalent 8 character parallel input part.
The on-board CMOS IC is the electronic heart of the display. The IC accepts decoded serial data, which is stored in the internal RAM. Asynchronously the RAM is read by the character multiplexer at a strobe rate that results in a flicker free display. Figure 8 shows the three functional areas of the IC. These include: the input serial data register and control logic, a 200 bits two port RAM, and an internal multiplexer/ display driver.

Figure 8. SCD558X block diagram

The following explains how to format the serial data to be loaded into the display. The user supplies a string of bit mapped decoded characters. The contents of this string is shown in Figure 9a. Figure 9b shows that each character consist of six 8 bit words. The first word encodes the display character location and the succeeding five bytes are row data. The row data represents the status (On, Off) of individual column LEDs. Figure 9c shows that each that each 8 bit word is formatted to include a three bit Operational Code (OPCODE) defined by bits D7-D5 and five bits (D4-D0) representing Column Data, Character Address, or Control Word Data.

Figure 9d shows the sequence for loading the bytes of data. Bringing the $\overline{\text { LOAD }}$ line low enables the serial register to accept data. The shift action occurs on the low to high transition of the serial data clock (SDCLK). The least significant bit (D0) is loaded first. After eight clock pulses the $\overline{\text { LOAD line is }}$ brought high. With this transition the OPCODE is decoded. The decoded OPCODE directs D4-D0 to be latched in the Character Address register, stored in the RAM as Column data, or latched in the Control Word register. The control IC requires a minimum 600 ns delay between successive byte loads. As indicated in Figure 9a, a total of 528 bits of data are required to load all eight characters into the display.

Row Address Register bits, D7-D5 (Table 3), direct the Column Data bits, D4-D0 (Table 3) to specific RAM location. Table 1 shows the Row Address for the example character "D." Column data is written and read asynchronously from the 200 bit RAM. Once loaded the internal oscillator and character multiplexer reads the data from the RAM. These characters are row strobed with column data as shown in Figures 8 and 9 . The character strobe rate is determined by the internal or user supplied external MUX Clock and the IC's $\div 320$ counter.

Table 1. Character "D"

|  | Opcode |  |  |  |  | Column Data |  |  |  |  |  |  |

## Multiplexer and Display Driver

The eight characters are row multiplexed with RAM resident column data. The strobe rate is established by the internal or external MUX Clock rate. The MUX Clock frequency is divided by a 320 counter chain. This results in a typical strobe rate of 750 Hz . By pulling the Clock SEL line low, the display can be operated from an external MUX Clock. The external clock is attached to the CLK I/O connection (pin 15). The maximum external MUX Clock frequency should be limited to 1 MHz .
An asynchronous hardware Reset (pin 13) is also provided. Bringing this pin low will clear the Character Address Register, Control Word Register, RAM, and blanks the display. This action leaves the display set at Character Address 0, and the Brightness Level set at 100\%.

## Electrical \& Mechanical Considerations

## Interconnect Considerations

Optimum product performance can be had when the following electrical and mechanical recommendations are adopted. The SCD558X's IC is constructed in a high speed CMOS process, consequently high speed noise on the SERIAL DATA, SERIAL DATA CLOCK, $\overline{\text { LOAD }}$ and $\overline{R E S E T}$ lines may cause incorrect data to be written into the serial shift register. Adhere to transmission line termination procedures when using fast line drivers and long cables (>10 cm). Good digital grounds (pins 14, 28) and power supply decoupling (pins $6,9,20,23$ ) will insure that $\mathrm{I}_{\mathrm{CC}}(<400 \mathrm{~mA}$ peak) switching currents do not generate localized ground bounce. Therefore it is recommended that each display package use a $0.1 \mu \mathrm{~F}$ and $20 \mu \mathrm{~F}$ capacitor between $\mathrm{V}_{\mathrm{CC}}$ and ground.
When the internal MUX Clock is being used connect the CLKSEL pin to $\mathrm{V}_{\mathrm{CC}}$. In those applications where RESET
will not be connected to the system's reset control, it is recommended that this pin be connected to the center node of a series $0.1, \mu \mathrm{~F}$ and $100 \mathrm{~K} \Omega \mathrm{RC}$ network. Thus upon initial power up the RESET will be held low for 10 ms allowing adequate time for the system power supply to stabilize.
The SCD558X allows up to 1.7 W of power dissipation at $70^{\circ}$ and 1.29 W power dissipation at a maximum operating tem-
perature of $85^{\circ} \mathrm{C}$. Approximately $60 \%$ of this power is dissipated by the IC to the PC board via the $\mathrm{V}_{\mathrm{CC}}$ connection (pins $6,9,20,23$ ). Optimum thermal reliability is obtained by connecting all of the $\mathrm{V}_{\mathrm{CC}}$ pins to a common pad located on both sides of the PC board. This technique offers a low thermal resistance for IC to system ambient.

## ESD Protection

The input protection structure of the SCD5580/1/2/3/4 provides significant protection against ESD damage. It is capable of withstanding discharges greater than 2 KV . Take all the standard precautions, normal for CMOS components. These include properly grounding personnel, tools, tables, and transport carriers that come in contact with unshielded parts. If these conditions are not, or cannot be met, keep the leads of the device shorted together or the parts in anti-static packaging.

## Soldering Considerations

THE SCD5580/1/2/3/4 can be hand soldered with SN63 solder using a grounded iron set to $260^{\circ} \mathrm{C}$.
Wave soldering is also possible following these conditions: Preheat that does not exceed $93^{\circ} \mathrm{C}$ on the solder side of the PC board or a package surface temperature of $85^{\circ} \mathrm{C}$. Water soluble organic acid flux (except carboxylic acid) or resinbased RMA flux without alcohol can be used.
Wave temperature of $245^{\circ} \mathrm{C} \pm 5^{\circ} \mathrm{C}$ with a dwell between 1.5 sec . to 3.0 sec . Exposure to the wave should not exceed temperatures above $260^{\circ} \mathrm{C}$ for five seconds at 0.063 " below the seating plane. The packages should not be immersed in the wave.

## Post Solder Cleaning Procedures

The least offensive cleaning solution is hot D.I. water $\left(60^{\circ} \mathrm{C}\right)$ for less than 15 minutes. Addition of mild saponifiers is acceptable. Do not use commercial dishwasher detergents.
For faster cleaning, solvents may be used. Exercise care in choosing solvents as some may chemically attack the nylon package. Maximum exposure should not exceed two minutes at elevated temperatures. Acceptable solvents are TF (trichorotrifluorethane), TA, 111 Trichloroethane, and unheated acetone. ${ }^{(1)}$
Note: 1.Acceptable commercial solvents are: Basic TF, Arklone, P. Genesolv, D. Genesolv DA, Blaco-Tron TF, Blaco-Tron TA, and Freon TA.
Unacceptable solvents contain alcohol, methanol, methylene chloride, ethanol, TP35, TCM, TMC, TMS+, TE, or TES. Since many commercial mixtures exist, contact a solvent vendor for chemical composition information. Some major solvent manufacturers are: Allied Chemical Corporation, Specialty Chemical Division, Morristown, NJ; Baron-Blakeslee, Chicago, IL; Dow Chemical, Midland, MI; E.I. DuPont de Nemours \& Co., Wilmington, DE.
For further information refer to Appnotes 18 and 19 in the current Siemens Optoelectronic Data Book.
An alternative to soldering and cleaning the display modules is to use sockets. Naturally, 28 pin DIP sockets .300 " wide with .100 " centers work well for single displays. Multiple display assemblies are best handled by longer SIP sockets or DIP sockets when available for uniform package alignment.

Socket manufacturers are Aries Electronics, Inc., Frenchtown, NJ; Garry Manufacturing, New Brunswick, NJ; Robin-son-Nugent, New Albany, IN; and Samtec Electronic Hardward, New Albany, IN.
For further information refer to Appnote 22 in the current Siemens Optoelectronic Data Book.

## Optical Considerations

The 0.145 " high character of the SCD558X gives readability up to eight feet. Proper filter selection enhances readability over this distance.

Using filters emphasizes the contrast ratio between a lit LED and the character background. This will increase the discrimination of different characters. The only limitation is cost. Take into consideration the ambient lighting environment for the best cost/benefit ratio for filters.
Incandescent (with almost no green) or fluorescent (with almost no red) lights do not have the flat spectral response of sunlight. Plastic band-pass filters are an inexpensive and effective way to strengthen contrast ratios. The SCD5580/2 are red/high efficiency red displays and should be matched with long wavelength pass filter in the 570 nm to 590 nm range. The SCD5583/4 should be matched with a yellowgreen band-pass filter that peaks at 565 nm . For displays of multiple colors, neutral density grey filters offer the best compromise.
Additional contrast enhancement is gained by shading the displays. Plastic band-pass filters with built-in louvers offer the next step up in contrast improvement. Plastic filters can be improved further with anti-reflective coatings to reduce glare. The trade-off is fuzzy characters. Mounting the filters close to the display reduces this effect. Take care not to overheat the plastic filter by allowing for proper air flow.

Optimal filter enhancements are gained by using circular polarized, anti-reflective, band-pass filters. The circular polarizing further enhances contrast by reducing the light that travels through the filter and reflects back off the display to less than $1 \%$.
Several filter manufacturers supply quality filter materials. Some of them are: Panelgraphic Corporation, W. Caldwell, NJ; SGL Homalite, Wilmington, DE; 3M Company, Visual Products Division, St. Paul, MN; Polaroid Corporation, Polarizer Division, Cambridge, MA; Marks Polarized Corporation, Deer Park, NY, Hoya Optics, Inc., Fremont, CA.
One last note on mounting filters: recessing displays and bezel assemblies is an inexpensive way to provide a shading effect in overhead lighting situations. Several Bezel manufacturers are: R.M.F. Products, Batavia, IL; Nobex Components, Griffith Plastic Corp., Burlingame, CA; Photo Chemical Products of California, Santa Monica, CA; I.E.E.-Atlas, Van Nuys, CA.

## Microprocessor Interface

The microprocessor interface is through the serial port, SPI port or one out of eight data bits on the eight bit parallel port and also control lines SDCLK and LOAD.

## Power Up Sequence

Upon power up display will come on at random. Thus the display should be reset at power-up. The reset will set the Address Register to Digit 0, User RAM is set to 0 (display blank) the Control Word is set to 0 ( $100 \%$ brightness with Lamp Test off) and the internal counters are reset.

Figure 12. SCD Interface to Siemens/Intel 8031 Microprocessor (using serial port in mode 0)

Figure 13. SCD558X Interface with Intel/Siemens 8031 Microprocessor (using one bit of parallel port as serial input)

Figure 14. SCD558X Interface with Motorola 68HC05C4 Microprocessor (using SPI Port)

## Cascading Multiple Displays

Multiple displays can be cascaded using the $\overline{\text { CLK SEL }}$ and CLK I/O pins as shown below. The display designated as the Master Clock source should have its CLK SEL pin tied high and the slaves should have their CLK SEL pins tied low. All CLK I/O pins should be tied together. One display CLK I/O can drive 15 slave CLK I/Os. Use $\overline{\mathrm{RST}}$ to synchronize all display counters.

Figure 15. Cascading multiple displays

## Loading Data Into the Display

Use following procedure to load data into the display:

1. Power up the display.
2. Bring $\overline{\mathrm{RST}}$ low ( 600 ns duration minimum) to clear the Multiplex Counter, Address Register, Control Word Register, User Ram and Data Register. The display will be blank. Display brightness is set to $100 \%$.
3. If a different brightness is desired, load the proper brightness opcode into the Control Word Register.
4. Load the Digit Address into the display.
5. Load display row and column data for the selected digit.
6. Repeat steps 4 and 5 for all digits.
