

1.35V DDR3 SDRAM RDIMM

MT9KSF12872PY – 1GB

For component data sheets, refer to Micron's Web site: www.micron.com

Features

- Low voltage DDR3 functionality and operations supported as defined in the component data sheet
- $V_{DD} = 1.35V \pm 0.0675V$
- Backward-compatible with standard 1.5V DDR3 systems
- 240-pin, registered dual in-line memory module (RDIMM)
- Fast data transfer rates: PC3-8500 or PC3-6400
- 1GB (128 Meg x 72)
- $V_{DDSPD} = +3V$ to $+3.6V$
- Supports ECC error detection and correction
- Nominal and dynamic on-die termination (ODT) for data, strobe, and mask signals
- Single rank
- On-board I²C temperature sensor with integrated serial presence-detect (SPD) EEPROM
- 8 internal device banks for concurrent operation
- Fixed burst length (BL) of 8 and burst chop (BC) of 4 via the mode register set (MRS)
- Adjustable data-output drive strength
- Serial presence-detect (SPD) with EEPROM
- Selectable BC4 or BL8 on-the-fly (OTF)
- Gold edge contacts
- Lead-free
- Fly-by topology
- Terminated control, command, and address bus

Figure 1: 240-Pin RDIMM (MO-269)

PCB height: 30.0mm (1.18in)

Options

- Operating temperature
 - Commercial ($0^{\circ}C \leq T_A \leq +70^{\circ}C$)
- Frequency/CAS latency
 - 1.87ns @ CL = 7 (DDR3-1066)
 - 2.5ns @ CL = 6 (DDR3-800)

Marking

None
-1G1
-80B

Table 1: Key Timing Parameters

Speed Grade	Industry Nomenclature	Data Rate (MT/s)			t_{RCD} (ns)	t_{RP} (ns)	t_{RC} (ns)

1GB (x72, ECC, SR, 1.35V) 240-Pin DDR3 SDRAM RDIMM Pin Assignments and Descriptions

Table 5: Pin Descriptions

Symbol	Type	Description
A[15:0]	Input	Address inputs: Provide the row address for ACTIVATE commands and the column address and auto precharge bit for READ/WRITE commands to select one location out of the memory array in the respective bank. A10 is sampled during a PRECHARGE command to determine whether the PRECHARGE applies to one bank (A10 LOW) or all banks (A10 HIGH). If only one bank is to be precharged, the bank is selected by BA. A12 is also used for BC4/BL8 identification as "BL on the fly" during CAS commands. The address inputs also provide the op-code during the mode register command set. A[13:0] address the 1Gb DDR3 devices. A[15:14] are needed to calculate parity on the command/address bus.
BA[2:0]	Input	Bank address inputs: BA0–BA2 define to which device bank an ACTIVATE, READ, WRITE, or PRECHARGE command is being applied. BA0–BA2 define which mode register, including MR, EMR, EMR(2), and EMR(3), is loaded during the LOAD MODE command. BA0–BA1 are used as part of the parity calculation.
CK0, CK0#	Input	Clock: CK0 and CK0# are differential clock inputs. All address and control input signals are sampled on the crossing of the positive edge of CK and the negative edge of CK#. Output data (DQs and DQS/DQS#) is referenced to the crossings of CK and CK#.
CKE0	Input	Clock enable: CKE (registered HIGH) activates and CKE (registered LOW) deactivates clocking circuitry on the DDR3 SDRAM.
DM[8:0] (DQS[17:9])	Input	Data input mask: DM is an input mask signal for write data. Input data is masked when DM is sampled HIGH, along with that input data, during a write access. DM is sampled on both edges of DQS. Although DM pins are input-only, the DM loading is designed to match that of DQ and DQS pins.
ODT	Input	On-die termination: ODT (registered HIGH) enables termination resistance internal to the DDR3 SDRAM. When enabled, ODT is only applied to the following pins: DQ, DQS, DQS#, and DM. The ODT input will be ignored if disabled via the LOAD MODE command.
PAR_IN	Input	Parity input: Parity bit for the address, RAS#, CAS#, and WE#.
RAS#, CAS#, WE#	Input	Command inputs: RAS#, CAS#, and WE# (along with S#) define the command being entered.
RESET#	Input (LVCMOS)	Reset: An active LOW CMOS input referenced to Vss and not referenced to VREFCA or VREFDQ.
SA[2:0]	Input	Serial address inputs: These pins are used to configure the SPD EEPROM address range.
S0#	Input	Chip select: S# enables (registered LOW) and disables (registered HIGH) the command decoder. With both inputs HIGH, all outputs of the register(s) are disabled except for CKE and ODT.
SCL	Input	Serial clock for presence-detect and temperature sensor: SCL is used to synchronize the communication to and from the EEPROM temperature sensor.
DQ[63:0]	I/O	Data input/output: Bidirectional data bus.
CB[7:0]	I/O	Check bits: Data used for ECC.
DQS[8:0], DQS#[8:0]	I/O	Data strobe: Output with read data, input with write data for source-synchronous operation. Edge-aligned with read data, center-aligned with write data. DQS# is only used when differential data strobe mode is enabled via the LOAD MODE command. DQS0–DQS8/DQS0#–DQS8# are inputs only when TDQS is disabled on x8 modules.
SDA	I/O	Serial data: SDA is a bidirectional pin used to transfer addresses and data into and out of the SPD EEPROM on the module.
EVENT#	Output	Temperature event: The optional EVENT# pin is used to flag critical module temperatures when used in conjunction with a temperature sensor.
ERR_OUT	Output (open drain)	Parity error output: Parity error found on the command, address, and control bus.
VDD	Supply	Power supply: 1.35V ±0.0675V or 1.5V ±0.075V. The component VDD and VDDQ are connected to the module VDD.

1GB (x72, ECC, SR, 1.35V) 240-Pin DDR3 SDRAM RDIMM Pin Assignments and Descriptions

Table 5: Pin Descriptions (continued)

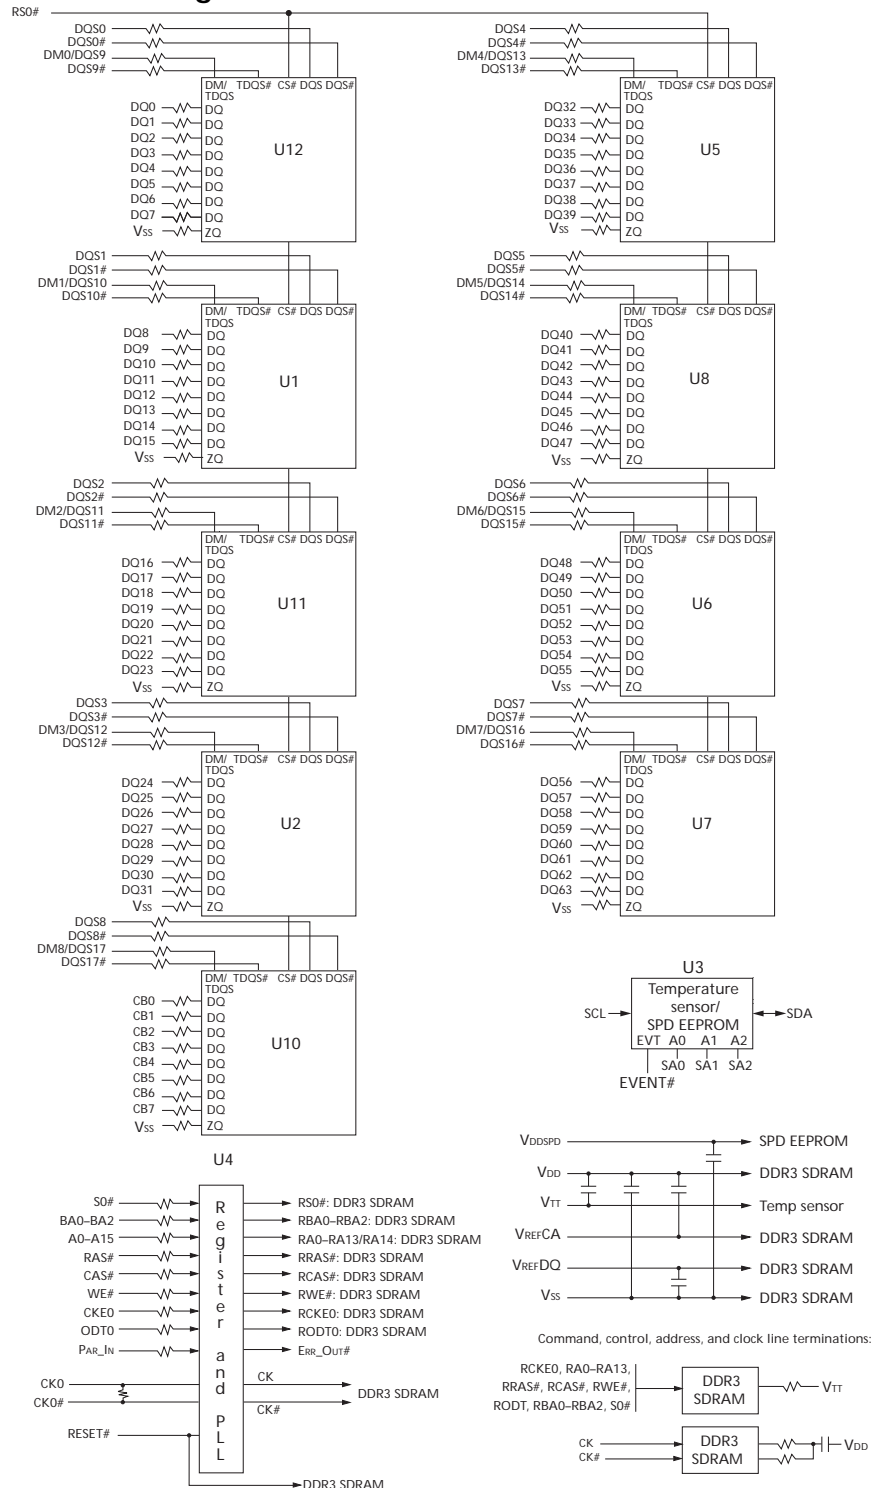

Symbol	Type	Description
VSS	Supply	Ground.
VTT	Supply	Termination voltage: Used for address, command, and control ($V_{DD}/2$).
VDDSPD	Supply	Serial EEPROM and temperature sensor power supply: +3V to +3.6V.
VREFDQ	Supply	Reference voltage: DQ, DM ($V_{DD}/2$).
VREFCA	Supply	Reference voltage: Command, address, and control ($V_{DD}/2$).
NC	–	No connect: These pins are not connected on the module.

1GB (x72, ECC, SR, 1.35V) 240-Pin DDR3 SDRAM RDIMM Functional Block Diagram

Functional Block Diagram

Figure 2: Functional Block Diagram

Notes: 1. The ZQ ball on each DDR3 component is connected to an external $240\Omega \pm 1\%$ resistor that is tied to ground. It is used for the calibration of the component's ODT and output driver.

General Description

The MT9KSF12872P 1.35V DDR3 SDRAM modules is a high-speed, CMOS dynamic random access 1GB memory module organized in a x72 configuration. These 1.35V DDR3 SDRAM modules use internally configured, 8-bank 1Gb DDR3 SDRAM devices.

1.35V DDR3 SDRAM modules use double data rate architecture to achieve high-speed operation. The double data rate architecture is essentially an $8n$ -prefetch architecture with an interface designed to transfer two data words per clock cycle at the I/O pins. A single read or write access for the DDR3 SDRAM module effectively consists of a single $8n$ -bit-wide, one-clock-cycle data transfer at the internal DRAM core and eight corresponding n -bit-wide, one-half-clock-cycle data transfers at the I/O pins.

The differential data strobe (DQS, DQS#) is transmitted externally, along with data, for use in data capture at the 1.35V DDR3 SDRAM input receiver. DQS is center-aligned with data for WRITES. The read data is transmitted by the DDR3 SDRAM and edge-aligned to the data strobes.

1.35V DDR3 SDRAM modules operate from a differential clock (CK and CK#); the crossing of CK going HIGH and CK# going LOW will be referred to as the positive edge of CK. Control, command, and address signals are registered at every positive edge of CK. Input data is registered on both edges of DQS, and output data is referenced to both edges of DQS, as well as to both edges of CK.

Fly-By Topology

These 1.35V DDR3 modules use faster clock speeds than earlier DDR technologies, making signal quality more important than ever. For improved signal quality, the clock, control, command, and address buses have been routed in a fly-by topology, where each clock, control, command, and address pin on each DRAM is connected to a single trace and terminated (rather than a tree structure, where the termination is off the module near the connector). Inherent to fly-by topology, the timing skew between the clock and DQS signals can be easily accounted for by using the write-leveling feature of DDR3.

Registering Clock Driver Operation

Registered 1.35V DDR3 SDRAM modules use a registering clock driver consisting of a register and a phase-lock loop (PLL) and comply with the JEDEC standard, "Definition of the SSTE32882 Registering Clock Driver with Parity and Quad Chip Selects for DDR3 RDIMM Applications."

The register section of the registering clock driver latches command and address input signals on the rising clock edge. The PLL section of the registering clock driver receives and redrives the differential clock signals (CK, CK#) to the DDR3 SDRAM devices. The register(s) and PLL reduce clock, control, command, and address signals loading by isolating DRAM from the system controller.

Parity Operations

The registering clock driver can accept a parity bit from the system's memory controller, providing even parity for the control, command, and address bus. Parity errors are flagged on the ERR_OUT# pin. Systems not using parity are expected to function without issue if PAR_IN and ERR_OUT# are left as no connects to the system.

Temperature Sensor with Serial Presence-Detect EEPROM

Thermal Sensor Operations

The temperature from the integrated thermal sensor is monitored and converts into a digital word via the I²C bus. System designers can use the user-programmable registers to create a custom temperature-sensing solution based on system requirements. Programming and configuration details comply with JEDEC Standard No. 21-C, page 4.7-1, "Mobile Platform Memory Module Thermal Sensor Component Specification."

Serial Presence-Detect EEPROM Operation

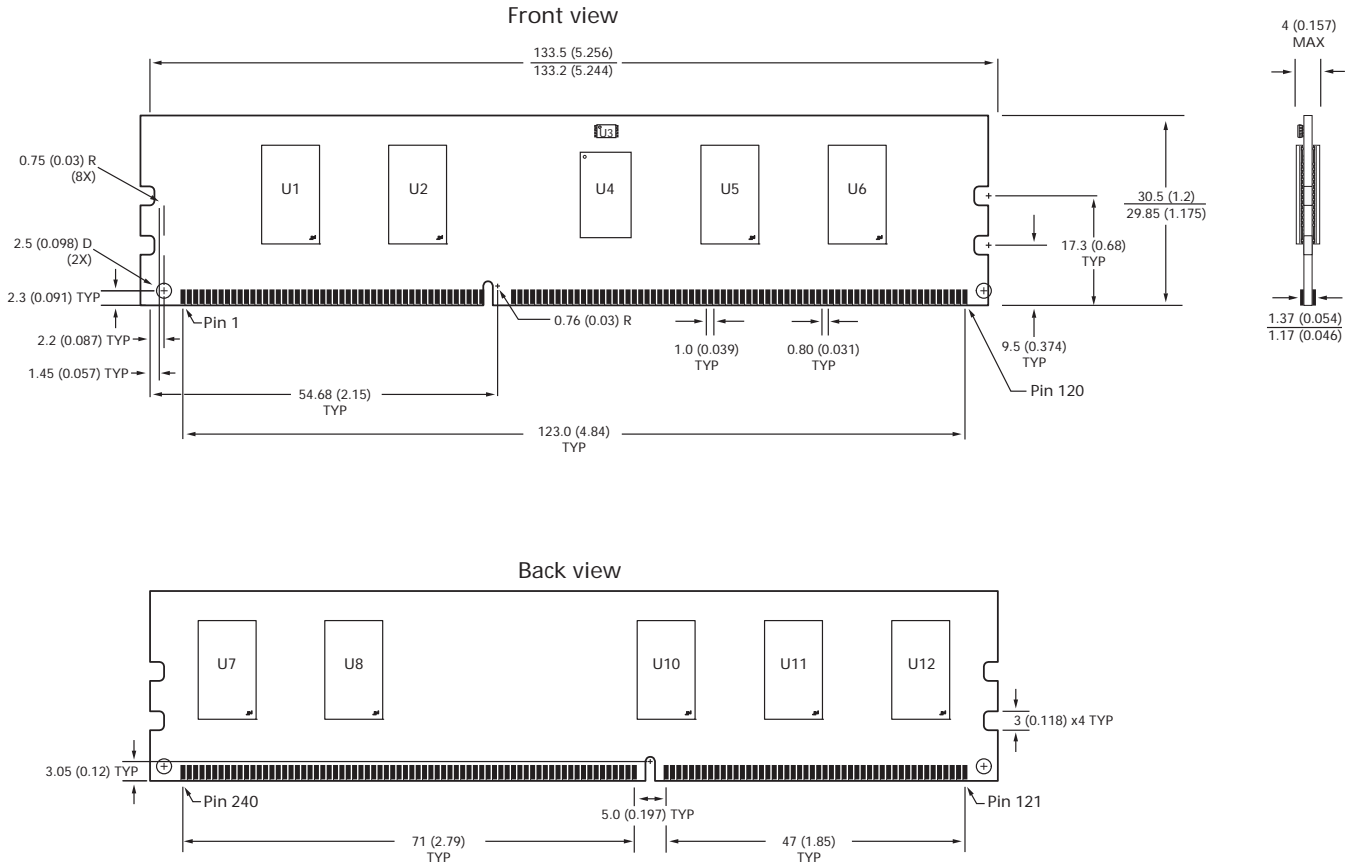

1.35V DDR3 SDRAM modules incorporate serial presence-detect. The SPD data is stored in a 256-byte EEPROM. The first 128 bytes are programmed by Micron to comply with JEDEC Standard JC-45 "Appendix X: Serial Presence Detect (SPD) for DDR3 SDRAM Modules." These bytes identify module-specific timing parameters, configuration information, and physical attributes. User-specific information can be written into the remaining 128 bytes of storage. System READ/WRITE operations between the master (system logic) and the slave EEPROM device occur via a standard I²C bus using the DIMM's SCL (clock) and SDA (data) signals, together with SA[2:0], which provide eight unique DIMM/EEPROM addresses. Write protect (WP) is connected to VSS, permanently disabling hardware write protect.

1GB (x72, ECC, SR, 1.35V) 240-Pin DDR3 SDRAM RDIMM Module Dimensions

Module Dimensions

Figure 3: 240-Pin DDR3 RDIMM

- Notes: 1. All dimensions are in millimeters (inches); MAX/MIN or typical (TYP) where noted.
 2. The dimensional diagram is for reference only.
