

Features

■ 1.71V to 5.5V Operating Range

■ Low Power CapSense™ Block

- Configurable Capacitive Sensing Elements
- Supports Combination of CapSense Buttons, Sliders, Touchpads, Touch Screens, and Proximity Sensor

■ Powerful Harvard Architecture Processor

- M8C Processor Speeds Running to 24 MHz
- Low Power at High Speed
- Interrupt Controller
- Temperature Range: -40°C to +85°C

■ Flexible On-Chip Memory

- Three Program/Data Storage Size Options:
 - CY8C20x36: 8K Flash / 1K SRAM
 - CY8C20x46: 16K Flash / 2K SRAM
 - CY8C20x66: 32K Flash / 2K SRAM
- 50,000 Flash Erase/Write Cycles
- Partial Flash Updates
- Flexible Protection Modes
- In-System Serial Programming (ISSP)

■ Full-Speed USB

- Available on CY8C20396 and CY8C20666 Only
- 12 Mbps USB 2.0 Compliant
- Eight Unidirectional Endpoints
- One Bidirectional Control Endpoint
- Dedicated 512 Byte Buffer
- Internally Regulated at 3.3V

■ Precision, Programmable Clocking

- Internal Main Oscillator: 6/12/24 MHz ± 5%
- Internal Low Speed Oscillator at 32 kHz for Watchdog and Sleep Timers
- Precision 32 kHz Oscillator for Optional External Crystal (CY8C20x46/66 only)
- 0.25% Accuracy for USB with No External Components (CY8C20396 and CY8C20666 only)

■ Programmable Pin Configurations

- Up to 36 GPIO (Depending on Package)
- Dual Mode GPIO: All GPIO Support Digital IO and Analog Input
- 25 mA Sink Current on All GPIO
- Pull up, High Z, Open Drain Modes on All GPIO
- CMOS Drive Mode(5 mA Source Current) on Ports 0 and 1:
 - 20 mA (at 3.0V) Total Source Current on Port 0
 - 20 mA (at 3.0V) Total Source Current on Port 1
- Selectable, Regulated Digital IO on Port 1
- Configurable Input Threshold on Port 1
- Hot Swap Capability on all Port 1 GPIO

■ Versatile Analog Mux

- Common Internal Analog Bus
- Simultaneous Connection of IO
- High PSRR Comparator
- Low Dropout Voltage Regulator for All Analog Resources

■ Additional System Resources

- I²C™ Slave:
 - Selectable to 50 kHz, 100 kHz, or 400 kHz
 - No Clock Stretching Required (under most conditions)
 - Implementation During Sleep Modes with Less Than 100 µA
 - Hardware Address Validation
- SPI™ Master and Slave: Configurable 46.9 kHz - 12 MHz
- Three 16-Bit Timers
- Watchdog and Sleep Timers
- Internal Voltage Reference
- Integrated Supervisory Circuit

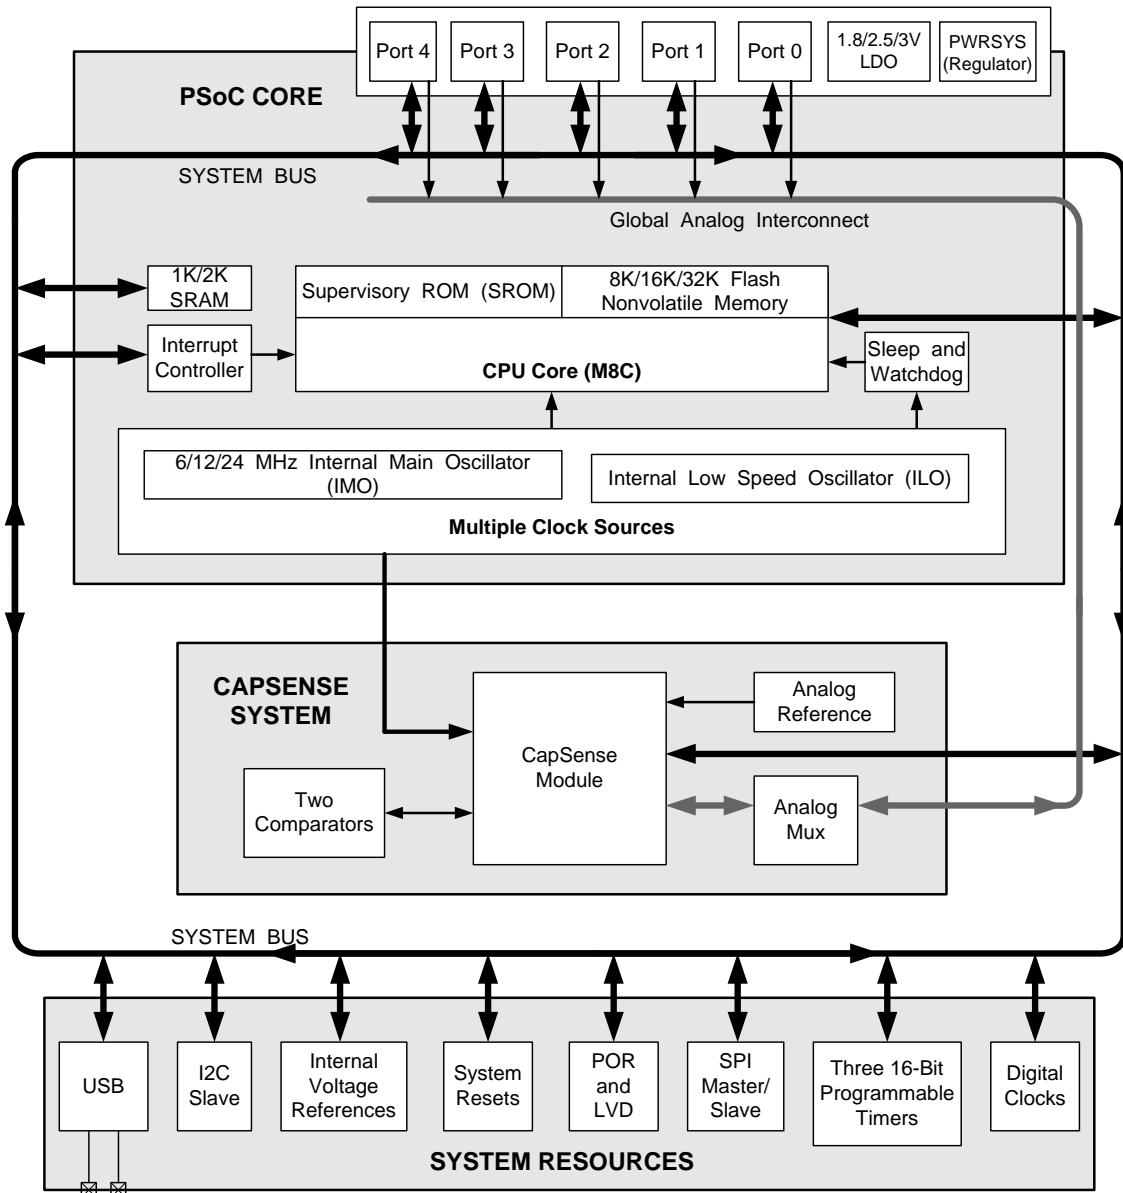

■ Complete Development Tools

- Free Development Tool (PSoC Designer™)
- Full Featured, In-Circuit Emulator and Programmer
- Full Speed Emulation
- Complex Breakpoint Structure
- 128K Trace Memory

■ Package Options

- CY8C20x36:
 - 16-Pin 3 x 3 x 0.6 mm QFN
 - 24-Pin 4 x 4 x 0.6 mm QFN
 - 32-Pin 5 x 5 x 0.6 mm QFN
- CY8C20x46:
 - 16-Pin 3 x 3 x 0.6 mm QFN
 - 24-Pin 4 x 4 x 0.6 mm QFN
 - 32-Pin 5 x 5 x 0.6 mm QFN
- CY8C20396: 24-Pin 4 x 4 x 0.6 mm QFN
- CY8C20x66:
 - 32-Pin 5 x 5 x 0.6 mm QFN
 - 48-Pin 7 x 7 x 1.0 mm QFN (with USB)
 - 48-Pin SSOP

Block Diagram

PSoC[®] Functional Overview

The PSoC family consists of on-chip Controller devices. These devices are designed to replace multiple traditional MCU-based components with one, low cost single-chip programmable component. A PSoC device includes configurable analog and digital blocks, and programmable interconnect. This architecture allows the user to create customized peripheral configurations, to match the requirements of each individual application. Additionally, a fast CPU, Flash program memory, SRAM data memory, and configurable IO are included in a range of convenient pinouts.

The architecture for this device family, as shown in the [Block Diagram on page 2](#), is comprised of three main areas: the Core, the CapSense Analog System, and the System Resources (including a full speed USB port). A common, versatile bus allows connection between IO and the analog system. Each CY8C20x36/46/66, CY8C20396 PSoC device includes a dedicated CapSense block that provides sensing and scanning control circuitry for capacitive sensing applications. Depending on the PSoC package, up to 36 general purpose IO (GPIO) are also included. The GPIO provides access to the MCU and analog mux.

PSoC Core

The PSoC Core is a powerful engine that supports a rich instruction set. It encompasses SRAM for data storage, an interrupt controller, sleep and watchdog timers, and IMO (internal main oscillator) and ILO (internal low speed oscillator). The CPU core, called the M8C, is a powerful processor with speeds up to 24 MHz. The M8C is a four-MIPS, 8-bit Harvard architecture microprocessor.

System Resources provide additional capability, such as configurable USB and I2C slave/SPI master-slave communication interface, three 16-bit programmable timers, and various system resets supported by the M8C.

The Analog System is composed of the CapSense PSoC block and an internal 1.2V analog reference, which together support capacitive sensing of up to 36 inputs.

CapSense Analog System

The Analog System contains the capacitive sensing hardware. Several hardware algorithms are supported. This hardware performs capacitive sensing and scanning without requiring external components. Capacitive sensing is configurable on each GPIO pin. Scanning of enabled CapSense pins are completed quickly and easily across multiple ports.

Figure 1. Analog System Block Diagram

Analog Multiplexer System

The Analog Mux Bus can connect to every GPIO pin. Pins are connected to the bus individually or in any combination. The bus also connects to the analog system for analysis with the CapSense block comparator.

Switch control logic enables selected pins to precharge continuously under hardware control. This enables capacitive measurement for applications such as touch sensing. Other multiplexer applications include:

- Complex capacitive sensing interfaces, such as sliders and touchpads.
- Chip-wide mux that allows analog input from any IO pin.
- Crosspoint connection between any IO pin combinations.

When designing capacitive sensing applications, refer to the latest signal-to-noise signal level requirements Application Notes, which can be found under <http://www.cypress.com> >> Documentation >> Application Notes. In general, and unless otherwise noted in the relevant Application Notes, the minimum signal-to-noise ratio (SNR) for CapSense applications is 5:1.

Additional System Resources

System Resources, some of which are listed in the previous sections, provide additional capability useful to complete systems. Additional resources include low voltage detection and power on reset. The merits of each system resource are listed here:

- The I2C slave/SPI master-slave module provides 50/100/400 kHz communication over two wires. SPI communication over three or four wires runs at speeds of 46.9 kHz to 3 MHz (lower for a slower system clock).
- The I2C hardware address recognition feature reduces the already low power consumption by eliminating the need for CPU intervention until a packet addressed to the target device is received.
- Low Voltage Detection (LVD) interrupts can signal the application of falling voltage levels, while the advanced POR (Power-On-Reset) circuit eliminates the need for a system supervisor.
- An internal reference provides an absolute reference for capacitive sensing.
- The 5.5V maximum input, 1.8/2.5/3V-selectable output, low-dropout regulator (LDO) provides regulation for IOs. A register-controlled bypass mode allows the user to disable the LDO.
- Standard Cypress PSoC IDE tools are available for debugging the CY8C20x36/46/66, CY8C20396 family of parts. However, the additional trace length and a minimal ground plane in the Flex-Pod can create noise problems that make it difficult to debug a Power PSoC design. A custom bonded On-Chip Debug (OCD) device is available in an 48-pin QFN package. The OCD device is recommended for debugging designs that have high current and/or high analog accuracy requirements. The QFN package is compact and is connected to the ICE through a high density connector.

Getting Started

The quickest way to understand PSoC silicon is to read this data sheet and then use the PSoC Designer Integrated Development Environment (IDE). This data sheet is an overview of the PSoC integrated circuit and presents specific pin, register, and electrical specifications.

For in depth information, along with detailed programming details, see the PSoC® Programmable System-on-Chip™ Technical Reference Manual for CY8C28xxx PSoC devices.

For up-to-date ordering, packaging, and electrical specification information, see the latest PSoC device data sheets on the web at www.cypress.com/psoc.

Development Tools

PSoC Designer™ is a Microsoft® Windows-based, integrated development environment for the Programmable System-on-Chip (PSoC) devices. The PSoC Designer IDE and application runs on Windows XP and Windows Vista.

This system provides design database management by project, an integrated debugger with In-Circuit Emulator, in-system programming support, and built-in support for third-party assemblers and C compilers.

PSoC Designer also supports C language compilers developed specifically for the devices in the PSoC family.

PSoC Designer Software Subsystems

System-Level View

The system-level view is a drag-and-drop visual embedded system design environment based on PSoC Express. In this view you solve design problems the same way you might think about the system. Select input and output devices based upon system requirements. Add a communication interface and define the interface to the system (registers). Define when and how an output device changes state based upon any/all other system devices. Based upon the design, PSoC Designer automatically selects one or more PSoC devices that match your system requirements.

PSoC Designer generates all embedded code, then compiles and links it into a programming file for a specific PSoC device.

Chip-Level View

The chip-level view is a more traditional integrated development environment (IDE) based on PSoC Designer 4.x. You choose a base device to work with and then select different onboard analog and digital components called user modules that use the PSoC blocks. Examples of user modules are ADCs, DACs, Amplifiers, and Filters. You configure the user modules for your chosen application and connect them to each other and to the proper pins. Then you generate your project. This prepopulates your project with APIs and libraries that you can use to program your application.

The tool also supports easy development of multiple configurations and dynamic reconfiguration. Dynamic reconfiguration allows for changing configurations at run time.

Hybrid Designs

You can begin in the system-level view, allow it to choose and configure your user modules, routing, and generate code, then switch to the chip-level view to gain complete control over on-chip resources. All views of the project share common code editor, builder, and common debug, emulation, and programming tools.

Code Generation Tools

PSoC Designer supports multiple third-party C compilers and assemblers. The code generation tools work seamlessly within the PSoC Designer interface and have been tested with a full range of debugging tools. The choice is yours.

Assemblers. The assemblers allow assembly code to be merged seamlessly with C code. Link libraries automatically use absolute addressing or are compiled in relative mode, and linked with other software modules to get absolute addressing.

C Language Compilers. C language compilers are available that support the PSoC family of devices. The products allow you to create complete C programs for the PSoC family devices.

The optimizing C compilers provide all the features of C tailored to the PSoC architecture. They come complete with embedded libraries providing port and bus operations, standard keypad and display support, and extended math functionality.

Debugger

PSoC Designer has a debug environment that provides hardware in-circuit emulation, allowing you to test the program in a physical system while providing an internal view of the PSoC device. Debugger commands allow the designer to read and program and read and write data memory, read and write IO registers, read and write CPU registers, set and clear breakpoints, and provide program run, halt, and step control. The debugger also allows the designer to create a trace buffer of registers and memory locations of interest.

Online Help System

The online help system displays online, context-sensitive help for the user. Designed for procedural and quick reference, each functional subsystem has its own context-sensitive help. This system also provides tutorials and links to FAQs and an Online Support Forum to aid the designer in getting started.

In-Circuit Emulator

A low cost, high functionality ICE (In-Circuit Emulator) is available for development support. This hardware has the capability to program single devices.

The emulator consists of a base unit that connects to the PC by way of a USB port. The base unit is universal and operates with all PSoC devices. Emulation pods for each device family are available separately. The emulation pod takes the place of the PSoC device in the target board and performs full speed (24 MHz) operation.

Designing with PSoC Designer

The development process for the PSoC device differs from that of a traditional fixed function microprocessor. The configurable analog and digital hardware blocks give the PSoC architecture a unique flexibility that pays dividends in managing specification change during development and by lowering inventory costs. These configurable resources, called PSoC Blocks, have the ability to implement a wide variety of user-selectable functions.

The PSoC development process can be summarized in the following four steps:

1. Select Components
2. Configure Components
3. Organize and Connect
4. Generate, Verify, and Debug

Select Components

Both the system-level and chip-level views provide a library of pre-built, pre-tested hardware peripheral components. In the system-level view these components are called “drivers” and correspond to inputs (a thermistor, for example), outputs (a brushless DC fan, for example), communication interfaces (I²C-bus, for example), and the logic to control how they interact with one another (called valuator).

In the chip-level view the components are called “user modules.” User modules make selecting and implementing peripheral devices simple, and come in analog, digital, and programmable system-on-chip varieties.

Configure Components

Each of the components you select establishes the basic register settings that implement the selected function. They also provide parameters and properties that allow you to tailor their precise configuration to your particular application. For example, a Pulse Width Modulator (PWM) User Module configures one or more digital PSoC blocks, one for each 8 bits of resolution. The user module parameters permit you to establish the pulse width and duty cycle. Configure the parameters and properties to correspond to your chosen application. Enter values directly or by selecting values from drop-down menus.

Both the system-level drivers and chip-level user modules are documented in data sheets that are viewed directly in PSoC Designer. These data sheets explain the internal operation of the component and provide performance specifications. Each data sheet describes the use of each user module parameter or driver property, and other information you may need to successfully implement your design.

Organize and Connect

You build signal chains at the chip level by interconnecting user modules to each other and the IO pins, or connect system-level inputs, outputs, and communication interfaces to each other with valuator functions.

In the system-level view selecting a potentiometer driver to control a variable speed fan driver and setting up the valuator to control the fan speed based on input from the pot selects, places, routes, and configures a programmable gain amplifier (PGA) to buffer the input from the potentiometer, an analog-to-digital converter (ADC) to convert the potentiometer’s output to a digital signal, and a PWM to control the fan.

In the chip-level view, you perform the selection, configuration, and routing so that you have complete control over the use of all on-chip resources.

Generate, Verify, and Debug

When you are ready to test the hardware configuration or move on to developing code for the project, you perform the “Generate Configuration Files” step. This causes PSoC Designer to generate source code that automatically configures the device to your specification and provides the software for the system.

Both system-level and chip-level designs generate software based on your design. The chip-level design provides application programming interfaces (APIs) with high-level functions to control and respond to hardware events at run time and interrupt service routines that you can adapt as needed. The system-level design also generates a C main() program that completely controls the chosen application and contains placeholders for custom code at strategic positions allowing you to further refine the software without disrupting the generated code.

A complete code development environment allows you to develop and customize your applications in C, assembly language, or both.

The last step in the development process takes place inside PSoC Designer’s Debugger (access by clicking the Connect icon). PSoC Designer downloads the HEX image to the In-Circuit Emulator (ICE) where it runs at full speed. PSoC Designer debugging capabilities rival those of systems costing many times more. In addition to traditional single-step, run-to-breakpoint and watch-variable features, the debug interface provides a large trace buffer and allows you to define complex breakpoint events that include monitoring address and data bus values, memory locations and external signals.

Document Conventions

Acronyms Used

The following table lists the acronyms that are used in this document.

Table 1. Acronyms

Acronym	Description
AC	alternating current
API	application programming interface
CPU	central processing unit
DC	direct current
FSR	full scale range
GPIO	general purpose IO
GUI	graphical user interface
ICE	in-circuit emulator
ILO	internal low speed oscillator
IMO	internal main oscillator
IO	input/output
LSb	least-significant bit
LVD	low voltage detect
MSb	most-significant bit
POR	power on reset
PPOR	precision power on reset
PSoC®	Programmable System-on-Chip™
SLIMO	slow IMO
SRAM	static random access memory

Units of Measure

A units of measure table is located in the Electrical Specifications section. [Table 9 on page 15](#) lists all the abbreviations used to measure the PSoC devices.

Numeric Naming

Hexadecimal numbers are represented with all letters in uppercase with an appended lowercase 'h' (for example, '14h' or '3Ah'). Hexadecimal numbers may also be represented by a '0x' prefix, the C coding convention. Binary numbers have an appended lowercase 'b' (for example, '01010100b' or '01000011b'). Numbers not indicated by an 'h', 'b', or 0x are decimal.

Pinouts

The CY8C20x36/46/66, CY8C20396 PSoC device is available in a variety of packages which are listed and illustrated in the following tables. Every port pin (labeled with a "P") is capable of Digital IO and connection to the common analog bus. However, Vss, Vdd, and XRES are not capable of Digital IO.

Absolute Maximum Ratings

Exceeding maximum ratings may shorten the useful life of the device. User guidelines are not tested.

Table 12. Absolute Maximum Ratings

Symbol	Description	Conditions	Min	Typ	Max	Units
T _{STG}	Storage Temperature	Higher storage temperatures reduces data retention time. Recommended Storage Temperature is +25°C ± 25°C. Extended duration storage temperatures above 85°C degrades reliability.	-55	+25	+125	°C
V _{dd}	Supply Voltage Relative to V _{ss}		-0.5	-	+6.0	V
V _{IO}	DC Input Voltage		V _{ss} - 0.5	-	V _{dd} + 0.5	V
V _{IOZ}	DC Voltage Applied to Tri-state		V _{ss} - 0.5	-	V _{dd} + 0.5	V
I _{MIO}	Maximum Current into any Port Pin		-25	-	+50	mA
ESD	Electro Static Discharge Voltage	Human Body Model ESD	2000	-	-	V
LU	Latch up Current	In accordance with JESD78 standard	-	-	200	mA

Operating Temperature

Table 13. Operating Temperature

Symbol	Description	Conditions	Min	Typ	Max	Units
T _A	Ambient Temperature		-40	-	+85	°C
T _J	Operational Die Temperature	The temperature rise from ambient to junction is package specific. Refer the table Thermal Impedances per Package on page 28 . The user must limit the power consumption to comply with this requirement.	-40	-	+100	°C

DC Chip-Level Specifications

The following table lists guaranteed maximum and minimum specifications for the entire voltage and temperature ranges.

Figure 13. Definition for Timing for Fast/Standard Mode on the I²C Bus

Note

10. A Fast-Mode I2C-bus device can be used in a Standard Mode I2C-bus system, but the requirement t_{SU, DAT} ≥ 250 ns must then be met. This automatically be the case if the device does not stretch the LOW period of the SCL signal. If such device does stretch the LOW period of the SCL signal, it must output the next data bit to the SDA line t_{max} + t_{SU, DAT} = 1000 + 250 = 1250 ns (according to the Standard-Mode I2C-bus specification) before the SCL line is released.

Packaging Information

This section illustrates the packaging specifications for the CY8C20x36/46/66, CY8C20396 PSoC device, along with the thermal impedances for each package.

Important Note Emulation tools may require a larger area on the target PCB than the chip's footprint. For a detailed description of the emulation tools' dimensions, refer to the document titled *PSoC Emulator Pod Dimensions* at <http://www.cypress.com/design/MR10161>.

Important Notes

- For information on the preferred dimensions for mounting QFN packages, see the following Application Note at http://www.amkor.com/products/notes_papers/MLFAppNote.pdf.
- Pinned vias for thermal conduction are not required for the low power PSoC device.

Thermal Impedances

Table 33. Thermal Impedances per Package

Package	Typical θ_{JA} [11]
16 QFN	32.69°C/W
24 QFN ^[12]	20.90°C/W
32 QFN ^[12]	19.51°C/W

32 QFN	240°C	260°C
48 SSOP	220°C	260°C
48 QFN	240°C	260°C

Notes

11. $T_J = T_A + \text{Power} \times \theta_{JA}$.
12. To achieve the thermal impedance specified for the QFN package, the center thermal pad must be soldered to the PCB ground plane.
13. Higher temperatures may be required based on the solder melting point. Typical temperatures for solder are 220 ± 5°C with Sn-Pb or 245 ± 5°C with Sn-Ag-Cu paste. Refer to the solder manufacturer specifications.

Development Tool Selection

Software

PSoC Designer™

At the core of the PSoC development software suite is PSoC Designer. This is used by thousands of PSoC developers. This robust software is facilitating PSoC designs for half a decade. PSoC Designer is available free of charge at <http://www.cypress.com> under DESIGN RESOURCES >> Software and Drivers.

PSoC Programmer

PSoC Programmer is flexible enough and is used on the bench in development and is also suitable for factory programming. PSoC Programmer works either as a standalone programming application or operates directly from PSoC Designer or PSoC Express. PSoC Programmer software is compatible with both PSoC ICE Cube In-Circuit Emulator and PSoC MiniProg. PSoC programmer is available free of charge at <http://www.cypress.com/psocprogrammer>.

C Compilers

PSoC Designer comes with a free HI-TECH C Lite C compiler. The HI-TECH C Lite compiler is free, supports all PSoC devices, integrates fully with PSoC Designer and PSoC Express, and runs on Windows versions up to 32-bit Vista. Compilers with additional features are available at additional cost from their manufactures.

- HI-TECH C PRO for the PSoC is available from <http://www.htsoft.com>.
- ImageCraft Cypress Edition Compiler is available from <http://www.imagecraft.com>.

Development Kits

All development kits are sold at the Cypress Online Store.

CY3215-DK Basic Development Kit

The CY3215-DK is for prototyping and development with PSoC Designer. This kit supports in-circuit emulation and the software interface enables users to run, halt, and single step the processor and view the content of specific memory locations. PSoC Designer supports the advance emulation features also. The kit includes:

- PSoC Designer Software CD
- ICE-Cube In-Circuit Emulator
- ICE Flex-Pod for CY8C29x66 Family
- Cat-5 Adapter
- Mini-Eval Programming Board
- 110 ~ 240V Power Supply, Euro-Plug Adapter
- iMAGEcraft C Compiler (Registration Required)
- ISSP Cable
- USB 2.0 Cable and Blue Cat-5 Cable
- 2 CY8C29466-24PXI 28-PDIP Chip Samples

CY3210-ExpressDK PSoC Express Development Kit

The CY3210-ExpressDK is for advanced prototyping and development with PSoC Express (used with ICE-Cube In-Circuit Emulator). It provides access to I²C buses, voltage reference, switches, upgradeable modules, and more. The kit includes:

- PSoC Express Software CD
- Express Development Board
- Four Fan Modules
- Two Proto Modules
- MiniProg In-System Serial Programmer
- MiniEval PCB Evaluation Board
- Jumper Wire Kit
- USB 2.0 Cable
- Serial Cable (DB9)
- 110 ~ 240V Power Supply, Euro-Plug Adapter
- 2 CY8C24423A-24PXI 28-PDIP Chip Samples
- 2 CY8C27443-24PXI 28-PDIP Chip Samples
- 2 CY8C29466-24PXI 28-PDIP Chip Samples

Evaluation Tools

All evaluation tools are sold at the Cypress Online Store.

CY3210-MiniProg1

The CY3210-MiniProg1 kit enables the user to program PSoC devices via the MiniProg1 programming unit. The MiniProg is a small, compact prototyping programmer that connects to the PC via a provided USB 2.0 cable. The kit includes:

- MiniProg Programming Unit
- MiniEval Socket Programming and Evaluation Board
- 28-Pin CY8C29466-24PXI PDIP PSoC Device Sample
- 28-Pin CY8C27443-24PXI PDIP PSoC Device Sample
- PSoC Designer Software CD
- Getting Started Guide
- USB 2.0 Cable

CY3210-PSoCEval1

The CY3210-PSoCEval1 kit features an evaluation board and the MiniProg1 programming unit. The evaluation board includes an LCD module, potentiometer, LEDs, and plenty of breadboarding space to meet all of your evaluation needs. The kit includes:

- Evaluation Board with LCD Module
- MiniProg Programming Unit
- 28-Pin CY8C29466-24PXI PDIP PSoC Device Sample (2)
- PSoC Designer Software CD
- Getting Started Guide
- USB 2.0 Cable

CY3214-PSoCEvalUSB

The CY3214-PSoCEvalUSB evaluation kit features a development board for the CY8C24794-24LFXI PSoC device. Special features of the board include both USB and capacitive sensing development and debugging support. This evaluation board also includes an LCD module, potentiometer, LEDs, an enunciator and plenty of bread boarding space to meet all of your evaluation needs. The kit includes:

- PSoCEvalUSB Board
- LCD Module
- MiniProg Programming Unit
- Mini USB Cable
- PSoC Designer and Example Projects CD
- Getting Started Guide
- Wire Pack

Device Programmers

All device programmers are purchased from the Cypress Online Store.

CY3216 Modular Programmer

The CY3216 Modular Programmer kit features a modular programmer and the MiniProg1 programming unit. The modular programmer includes three programming module cards and supports multiple Cypress products. The kit includes:

- Modular Programmer Base
- Three Programming Module Cards
- MiniProg Programming Unit
- PSoC Designer Software CD
- Getting Started Guide
- USB 2.0 Cable

CY3207ISSP In-System Serial Programmer (ISSP)

The CY3207ISSP is a production programmer. It includes protection circuitry and an industrial case that is more robust than the MiniProg in a production programming environment.

Note that CY3207ISSP needs special software and is not compatible with PSoC Programmer. The kit includes:

- CY3207 Programmer Unit
- PSoC ISSP Software CD
- 110 ~ 240V Power Supply, Euro-Plug Adapter
- USB 2.0 Cable

Third-Party Tools

Several tools have been specially designed by the following third-party vendors to accompany PSoC devices during development and production. Specific details for each of these tools can be found at <http://www.cypress.com> under Documentation >> Evaluation Boards.

Build a PSoC Emulator into Your Board

For details on how to emulate your circuit before going to volume production using an on-chip debug (OCD) non-production PSoC device, refer Application Note “*Debugging - Build a PSoC Emulator into Your Board - AN2323*” at <http://www.cypress.com/AN2323>.

Notes

- 14. Flex-Pod kit includes a practice flex-pod and a practice PCB, in addition to two flex-pods.
- 15. Foot kit includes surface mount feet that can be soldered to the target PCB.
- 16. Programming adapter converts non-DIP package to DIP footprint. Specific details and ordering information for each of the adapters can be found at <http://www.emulation.com>.

Cypress Semiconductor Corporation assumes no responsibility for the use of any circuitry other than circuitry embodied in a Cypress product. Nor does it convey or imply any license under patent or other rights. Cypress products are not warranted nor intended to be used for medical, life support, life saving, critical control or safety applications, unless pursuant to an express written agreement with Cypress. Furthermore, Cypress does not authorize its products for use as critical components in life-support systems where a malfunction or failure may reasonably be expected to result in significant injury to the user. The inclusion of Cypress products in life-support systems application implies that the manufacturer assumes all risk of such use and in doing so indemnifies Cypress against all charges.
