# 1 Overview

The MPC860 power quad integrated communications controller (PowerQUICC<sup>TM</sup>) is a versatile one-chip integrated microprocessor and peripheral combination designed for a variety of controller applications. It particularly excels in communications and networking systems. The PowerQUICC unit is referred to as the MPC860 in this hardware specification.

The MPC860 implements Power Architecture<sup>TM</sup> technology and contains a superset of Freescale's MC68360 quad integrated communications controller (QUICC), referred to here as the QUICC, RISC communications proceessor module (CPM). The CPU on the MPC860 is a 32-bit core built on Power Architecture technology that incorporates memory management units (MMUs) and instruction and data caches.. The CPM from the MC68360 QUICC has been enhanced by the addition of the inter-integrated controller (I<sup>2</sup>C) channel. The memory controller has been enhanced, enabling the MPC860 to support any type of memory, including high-performance memories and new types of DRAMs. A PCMCIA socket controller supports up to two sockets. A real-time clock has also been integrated.

Table 1 shows the functionality supported by the MPC860 family.

|          | Cache (              | (Kbytes)   | Ethe    | ernet  |     |     |                        |
|----------|----------------------|------------|---------|--------|-----|-----|------------------------|
| Part     | Instruction<br>Cache | Data Cache | 10T     | 10/100 | ATM | SCC | Reference <sup>1</sup> |

| MPC860P  | 16                   | 8          | Up to 4 | 1      | Yes | 4   | 1                      |
| MPC855T  | 4                    | 4          | 1       | 1      | Yes | 1   | 2                      |

Table 1. MPC860 Family Functionality

Supporting documentation for these devices refers to the following:

1. MPC860 PowerQUICC Family User's Manual (MPC860UM, Rev. 3)

2. MPC855T User's Manual (MPC855TUM, Rev. 1)

The following list summarizes the key MPC860 features:

- Embedded single-issue, 32-bit core (implementing the Power Architecture technology) with thirty-two 32-bit general-purpose registers (GPRs)
  - The core performs branch prediction with conditional prefetch without conditional execution.
  - 4- or 8-Kbyte data cache and 4- or 16-Kbyte instruction cache (see Table 1)
    - 16-Kbyte instruction caches are four-way, set-associative with 256 sets; 4-Kbyte instruction caches are two-way, set-associative with 128 sets.
    - 8-Kbyte data caches are two-way, set-associative with 256 sets; 4-Kbyte data caches are two-way, set-associative with 128 sets.
    - Cache coherency for both instruction and data caches is maintained on 128-bit (4-word) cache blocks.
    - Caches are physically addressed, implement a least recently used (LRU) replacement algorithm, and are lockable on a cache block basis.
  - MMUs with 32-entry TLB, fully-associative instruction, and data TLBs
  - MMUs support multiple page sizes of 4-, 16-, and 512-Kbytes, and 8-Mbytes; 16 virtual address spaces and 16 protection groups
  - Advanced on-chip-emulation debug mode
- Up to 32-bit data bus (dynamic bus sizing for 8, 16, and 32 bits)
- 32 address lines
- Operates at up to 80 MHz
- Memory controller (eight banks)
  - Contains complete dynamic RAM (DRAM) controller
  - Each bank can be a chip select or  $\overline{RAS}$  to support a DRAM bank.
  - Up to 15 wait states programmable per memory bank
  - Glueless interface to DRAM, SIMMS, SRAM, EPROM, Flash EPROM, and other memory devices
  - DRAM controller programmable to support most size and speed memory interfaces
  - Four  $\overline{\text{CAS}}$  lines, four  $\overline{\text{WE}}$  lines, and one  $\overline{\text{OE}}$  line
  - Boot chip-select available at reset (options for 8-, 16-, or 32-bit memory)
  - Variable block sizes (32 Kbytes to 256 Mbytes)
  - Selectable write protection
  - On-chip bus arbitration logic
- General-purpose timers
  - Four 16-bit timers or two 32-bit timers
  - Gate mode can enable/disable counting
  - Interrupt can be masked on reference match and event capture.

#### MPC860 PowerQUICC<sup>™</sup> Family Hardware Specifications, Rev. 8

- System integration unit (SIU)
  - Bus monitor
  - Software watchdog
  - Periodic interrupt timer (PIT)
  - Low-power stop mode
  - Clock synthesizer
  - Decrementer, time base, and real-time clock (RTC)
  - Reset controller
  - IEEE 1149.1<sup>TM</sup> Std. test access port (JTAG)
- Interrupts
  - Seven external interrupt request (IRQ) lines
  - 12 port pins with interrupt capability
  - 23 internal interrupt sources
  - Programmable priority between SCCs
  - Programmable highest priority request
- 10/100 Mbps Ethernet support, fully compliant with the IEEE 802.3u® Standard (not available when using ATM over UTOPIA interface)
- ATM support compliant with ATM forum UNI 4.0 specification
  - Cell processing up to 50–70 Mbps at 50-MHz system clock
  - Cell multiplexing/demultiplexing
  - Support of AAL5 and AAL0 protocols on a per-VC basis. AAL0 support enables OAM and software implementation of other protocols.
  - ATM pace control (APC) scheduler, providing direct support for constant bit rate (CBR) and unspecified bit rate (UBR) and providing control mechanisms enabling software support of available bit rate (ABR)
  - Physical interface support for UTOPIA (10/100-Mbps is not supported with this interface) and byte-aligned serial (for example, T1/E1/ADSL)
  - UTOPIA-mode ATM supports level-1 master with cell-level handshake, multi-PHY (up to four physical layer devices), connection to 25-, 51-, or 155-Mbps framers, and UTOPIA/system clock ratios of 1/2 or 1/3.
  - Serial-mode ATM connection supports transmission convergence (TC) function for T1/E1/ADSL lines, cell delineation, cell payload scrambling/descrambling, automatic idle/unassigned cell insertion/stripping, header error control (HEC) generation, checking, and statistics.
- Communications processor module (CPM)
  - RISC communications processor (CP)
  - Communication-specific commands (for example, GRACEFUL STOP TRANSMIT, ENTER HUNT MODE, and RESTART TRANSMIT)
  - Supports continuous mode transmission and reception on all serial channels

#### MPC860 PowerQUICC™ Family Hardware Specifications, Rev. 8

- Up to 8 Kbytes of dual-port RAM
- 16 serial DMA (SDMA) channels
- Three parallel I/O registers with open-drain capability
- Four baud-rate generators (BRGs)
  - Independent (can be tied to any SCC or SMC)
  - Allows changes during operation
  - Autobaud support option
- Four serial communications controllers (SCCs)
  - Ethernet/IEEE 802.3<sup>®</sup> standard optional on SCC1–4, supporting full 10-Mbps operation (available only on specially programmed devices)
  - HDLC/SDLC (all channels supported at 2 Mbps)
  - HDLC bus (implements an HDLC-based local area network (LAN))
  - Asynchronous HDLC to support point-to-point protocol (PPP)
  - AppleTalk
  - Universal asynchronous receiver transmitter (UART)
  - Synchronous UART
  - Serial infrared (IrDA)
  - Binary synchronous communication (BISYNC)
  - Totally transparent (bit streams)
  - Totally transparent (frame-based with optional cyclic redundancy check (CRC))
- Two SMCs (serial management channels)
  - UART
  - Transparent
  - General circuit interface (GCI) controller
  - Can be connected to the time-division multiplexed (TDM) channels
- One SPI (serial peripheral interface)
  - Supports master and slave modes
  - Supports multimaster operation on the same bus
- One I<sup>2</sup>C (inter-integrated circuit) port
  - Supports master and slave modes
  - Multiple-master environment support
- Time-slot assigner (TSA)
  - Allows SCCs and SMCs to run in multiplexed and/or non-multiplexed operation
  - Supports T1, CEPT, PCM highway, ISDN basic rate, ISDN primary rate, user defined
  - 1- or 8-bit resolution
  - Allows independent transmit and receive routing, frame synchronization, and clocking

#### MPC860 PowerQUICC™ Family Hardware Specifications, Rev. 8

- Allows dynamic changes
- Can be internally connected to six serial channels (four SCCs and two SMCs)
- Parallel interface port (PIP)
  - Centronics interface support
  - Supports fast connection between compatible ports on the MPC860 or the MC68360
- PCMCIA interface
  - Master (socket) interface, release 2.1 compliant
  - Supports two independent PCMCIA sockets
  - Supports eight memory or I/O windows
- Low power support
  - Full on—all units fully powered
  - Doze—core functional units disabled except time base decrementer, PLL, memory controller, RTC, and CPM in low-power standby
  - Sleep-all units disabled except RTC and PIT, PLL active for fast wake up
  - Deep sleep—all units disabled including PLL except RTC and PIT
  - Power down mode—all units powered down except PLL, RTC, PIT, time base, and decrementer
- Debug interface
  - Eight comparators: four operate on instruction address, two operate on data address, and two
    operate on data
  - Supports conditions: =  $\neq$  < >
  - Each watchpoint can generate a break-point internally.
- 3.3-V operation with 5-V TTL compatibility except EXTAL and EXTCLK
- 357-pin ball grid array (BGA) package

**Maximum Tolerated Ratings** 

# 3 Maximum Tolerated Ratings

This section provides the maximum tolerated voltage and temperature ranges for the MPC860. Table 2 provides the maximum ratings.

This device contains circuitry protecting against damage due to high-static voltage or electrical fields; however, it is advised that normal precautions be taken to avoid application of any voltages higher than maximum-rated voltages to this high-impedance circuit. Reliability of operation is enhanced if unused inputs are tied to an appropriate logic voltage level (for example, either GND or  $V_{DD}$ ).

(GND = 0 V)

#### **Table 2. Maximum Tolerated Ratings**

| Rating                              | Symbol              | Value                         | Unit |
|-------------------------------------|---------------------|-------------------------------|------|
| Supply voltage <sup>1</sup>         | V <sub>DDH</sub>    | -0.3 to 4.0                   | V    |
|                                     | V <sub>DDL</sub>    | -0.3 to 4.0                   | V    |
|                                     | KAPWR               | -0.3 to 4.0                   | V    |
|                                     | V <sub>DDSYN</sub>  | -0.3 to 4.0                   | V    |
| Input voltage <sup>2</sup>          | V <sub>in</sub>     | GND – 0.3 to V <sub>DDH</sub> | V    |
| Temperature <sup>3</sup> (standard) | T <sub>A(min)</sub> | 0                             | °C   |
|                                     | T <sub>j(max)</sub> | 95                            | °C   |
| Temperature <sup>3</sup> (extended) | T <sub>A(min)</sub> | -40                           | °C   |
|                                     | T <sub>j(max)</sub> | 95                            | °C   |
| Storage temperature range           | T <sub>stg</sub>    | -55 to 150                    | °C   |

<sup>1</sup> The power supply of the device must start its ramp from 0.0 V.

<sup>2</sup> Functional operating conditions are provided with the DC electrical specifications in Table 6. Absolute maximum ratings are stress ratings only; functional operation at the maxima is not guaranteed. Stress beyond those listed may affect device reliability or cause permanent damage to the device.

**Caution**: All inputs that tolerate 5 V cannot be more than 2.5 V greater than the supply voltage. This restriction applies to power-up and normal operation (that is, if the MPC860 is unpowered, voltage greater than 2.5 V must not be applied to its inputs).

<sup>3</sup> Minimum temperatures are guaranteed as ambient temperature, T<sub>A</sub>. Maximum temperatures are guaranteed as junction temperature, T<sub>j</sub>.

#### **Thermal Characteristics**

Figure 1 shows the undershoot and overshoot voltages at the interface of the MPC860.

1. t<sub>interface</sub> refers to the clock period associated with the bus clock interface.

### 4 Thermal Characteristics

#### Table 3. Package Description

| Package Designator | Package Code (Case No.) | Package Description     |
|--------------------|-------------------------|-------------------------|
| ZP                 | 5050 (1103-01)          | PBGA 357 25*25*0.9P1.27 |
| ZQ/VR              | 5058 (1103D-02)         | PBGA 357 25*25*1.2P1.27 |

MPC860 PowerQUICC<sup>™</sup> Family Hardware Specifications, Rev. 8

Table 4 shows the thermal characteristics for the MPC860.

| Rating                           | Env                  | ironment                | Symbol               | ZP<br>MPC860P | ZQ / VR<br>MPC860P | Unit |
|----------------------------------|----------------------|-------------------------|----------------------|---------------|--------------------|------|
| Mold Compound Thicknes           | 0.85                 | 1.15                    | mm                   |               |                    |      |
| Junction-to-ambient <sup>1</sup> | Natural convection   | Single-layer board (1s) | $R_{\theta JA}^2$    | 34            | 34                 | •C/W |
|                                  |                      | Four-layer board (2s2p) | $R_{\theta JMA}^{3}$ | 22            | 22                 |      |
|                                  | Airflow (200 ft/min) | Single-layer board (1s) | $R_{\theta JMA}^{3}$ | 27            | 27                 |      |
|                                  |                      | Four-layer board (2s2p) | $R_{\theta JMA}^{3}$ | 18            | 18                 |      |
| Junction-to-board <sup>4</sup>   |                      |                         | $R_{\theta J B}$     | 14            | 13                 |      |
| Junction-to-case <sup>5</sup>    |                      |                         |                      |               | 8                  |      |
| Junction-to-package top 6        | Natural convection   |                         | $\Psi_{JT}$          | 2             | 2                  |      |

#### Table 4. MPC860 Thermal Resistance Data

<sup>1</sup> Junction temperature is a function of on-chip power dissipation, package thermal resistance, mounting site (board) temperature, ambient temperature, airflow, power dissipation of other components on the board, and board thermal resistance.

<sup>2</sup> Per SEMI G38-87 and JEDEC JESD51-2 with the single-layer board horizontal.

<sup>3</sup> Per JEDEC JESD51-6 with the board horizontal.

<sup>4</sup> Thermal resistance between the die and the printed-circuit board per JEDEC JESD51-8. Board temperature is measured on the top surface of the board near the package.

- <sup>5</sup> Indicates the average thermal resistance between the die and the case top surface as measured by the cold plate method (MIL SPEC-883 Method 1012.1) with the cold plate temperature used for the case temperature. For exposed pad packages where the pad would be expected to be soldered, junction-to-case thermal resistance is a simulated value from the junction to the exposed pad without contact resistance.
- <sup>6</sup> Thermal characterization parameter indicating the temperature difference between the package top and the junction temperature per JEDEC JESD51-2.

MPC860 PowerQUICC<sup>™</sup> Family Hardware Specifications, Rev. 8

# 5 **Power Dissipation**

Table 5 provides power dissipation information. The modes are 1:1, where CPU and bus speeds are equal, and 2:1, where CPU frequency is twice the bus speed.

| Die Revision   | Frequency (MHz)  | Typical <sup>1</sup> | Maximum <sup>2</sup> | Unit |
|----------------|--|----------------------|----------------------|------|
| .4<br>:1 mode) | 50   | 656                  | 735                  | mW   |
| (1:1 mode)     | 66   | TBD                  | TBD                  | mW   |
| D.4            | 50         656         735         m           66         TBD         TBD         m           66         722         762         m | mW                   |                      |      |
| (2:1 mode)     | 80   | 851                  | 909                  | mW   |

#### Table 5. Power Dissipation (P<sub>D</sub>)

<sup>1</sup> Typical power dissipation is measured at 3.3 V.

<sup>2</sup> Maximum power dissipation is measured at 3.5 V.

NOTE

Values in Table 5 represent  $V_{DDL}$ -based power dissipation and do not include I/O power dissipation over  $V_{DDH}$ . I/O power dissipation varies widely by application due to buffer current, depending on external circuitry.

# 6 DC Characteristics

Table 6 provides the DC electrical characteristics for the MPC860.

 Table 6. DC Electrical Specifications

| Characteristic  | Symbol   | Min                    | Мах                    | Unit |
|---|--|------------------------|------------------------|------|
| Operating voltage at 40 MHz or less   | V <sub>DDH</sub> , V <sub>DDL</sub> , V <sub>DDSYN</sub>           | 3.0                    | 3.6                    | V    |
|   | KAPWR<br>(power-down mode)   | 2.0                    | 3.6                    | V    |
|   | KAPWR<br>(all other operating modes)                               | V <sub>DDH</sub> – 0.4 | V <sub>DDH</sub>       | V    |
| Operating voltage greater than 40 MHz   | V <sub>DDH</sub> , V <sub>DDL</sub> , KAPWR,<br>V <sub>DDSYN</sub> | 3.135                  | 3.465                  | V    |
|   | KAPWR<br>(power-down mode)   | 2.0                    | 3.6                    | V    |
|   | KAPWR<br>(all other operating modes)                               | V <sub>DDH</sub> – 0.4 | V <sub>DDH</sub>       | V    |
| Input high voltage (all inputs except EXTAL and EXTCLK)                                 | V <sub>IH</sub>  | 2.0                    | 5.5                    | V    |
| Input low voltage <sup>1</sup>  | V <sub>IL</sub>  | GND                    | 0.8                    | V    |
| EXTAL, EXTCLK input high voltage  | V <sub>IHC</sub>   | $0.7 	imes (V_{DDH})$  | V <sub>DDH</sub> + 0.3 | V    |
| Input leakage current, $V_{in} = 5.5 \text{ V}$ (except TMS, TRST, DSCK, and DSDI pins) | l <sub>in</sub>  |                        | 100                    | μA   |

**Thermal Calculation and Measurement** 

### 7 Thermal Calculation and Measurement

For the following discussions,  $P_D = (V_{DD} \times I_{DD}) + PI/O$ , where PI/O is the power dissipation of the I/O drivers.

### 7.1 Estimation with Junction-to-Ambient Thermal Resistance

An estimation of the chip junction temperature, T<sub>J</sub>, in °C can be obtained from the equation:

$$T_J = T_A + (R_{\theta JA} \times P_D)$$

where:

 $T_A$  = ambient temperature (°C)

 $R_{\theta JA}$  = package junction-to-ambient thermal resistance (°C/W)

 $P_D$  = power dissipation in package

The junction-to-ambient thermal resistance is an industry standard value which provides a quick and easy estimation of thermal performance. However, the answer is only an estimate; test cases have demonstrated that errors of a factor of two (in the quantity  $T_J - T_A$ ) are possible.

### 7.2 Estimation with Junction-to-Case Thermal Resistance

Historically, the thermal resistance has frequently been expressed as the sum of a junction-to-case thermal resistance and a case-to-ambient thermal resistance:

$$R_{\theta JA} = R_{\theta JC} + R_{\theta CA}$$

where:

 $R_{\theta JA}$  = junction-to-ambient thermal resistance (°C/W)

 $R_{\theta IC}$  = junction-to-case thermal resistance (°C/W)

 $R_{\theta CA}$  = case-to-ambient thermal resistance (°C/W)

 $R_{\theta JC}$  is device related and cannot be influenced by the user. The user adjusts the thermal environment to affect the case-to-ambient thermal resistance,  $R_{\theta CA}$ . For instance, the user can change the airflow around the device, add a heat sink, change the mounting arrangement on the printed-circuit board, or change the thermal dissipation on the printed-circuit board surrounding the device. This thermal model is most useful for ceramic packages with heat sinks where some 90% of the heat flows through the case and the heat sink to the ambient environment. For most packages, a better model is required.

### 7.3 Estimation with Junction-to-Board Thermal Resistance

A simple package thermal model which has demonstrated reasonable accuracy (about 20%) is a two-resistor model consisting of a junction-to-board and a junction-to-case thermal resistance. The junction-to-case thermal resistance covers the situation where a heat sink is used or where a substantial amount of heat is dissipated from the top of the package. The junction-to-board thermal resistance describes the thermal performance when most of the heat is conducted to the printed-circuit board. It has been observed that the thermal performance of most plastic packages, especially PBGA packages, is strongly dependent on the board temperature; see Figure 2.

#### MPC860 PowerQUICC™ Family Hardware Specifications, Rev. 8

Figure 2. Effect of Board Temperature Rise on Thermal Behavior

If the board temperature is known, an estimate of the junction temperature in the environment can be made using the following equation:

$$T_{J} = T_{B} + (R_{\theta JB} \times P_{D})$$

where:

 $R_{\theta JB}$  = junction-to-board thermal resistance (°C/W)

 $T_B = \text{board temperature (°C)}$ 

 $P_D$  = power dissipation in package

If the board temperature is known and the heat loss from the package case to the air can be ignored, acceptable predictions of junction temperature can be made. For this method to work, the board and board mounting must be similar to the test board used to determine the junction-to-board thermal resistance, namely a 2s2p (board with a power and a ground plane) and by attaching the thermal balls to the ground plane.

### 7.4 Estimation Using Simulation

When the board temperature is not known, a thermal simulation of the application is needed. The simple two-resistor model can be used with the thermal simulation of the application [2], or a more accurate and complex model of the package can be used in the thermal simulation.

### 7.5 Experimental Determination

To determine the junction temperature of the device in the application after prototypes are available, the thermal characterization parameter ( $\Psi_{JT}$ ) can be used to determine the junction temperature with a measurement of the temperature at the top center of the package case using the following equation:

$$T_J = T_T + (\Psi_{JT} \times P_D)$$

#### MPC860 PowerQUICC<sup>™</sup> Family Hardware Specifications, Rev. 8

#### Layout Practices

where:

 $\Psi_{JT}$  = thermal characterization parameter

 $T_T$  = thermocouple temperature on top of package

 $P_D$  = power dissipation in package

The thermal characterization parameter is measured per JEDEC JESD51-2 specification using a 40 gauge type T thermocouple epoxied to the top center of the package case. The thermocouple should be positioned so that the thermocouple junction rests on the package. A small amount of epoxy is placed over the thermocouple junction and over 1 mm of wire extending from the junction. The thermocouple wire is placed flat against the package case to avoid measurement errors caused by cooling effects of the thermocouple wire.

# 8 Layout Practices

Each  $V_{DD}$  pin on the MPC860 should be provided with a low-impedance path to the board's supply. Each GND pin should likewise be provided with a low-impedance path to ground. The power supply pins drive distinct groups of logic on the chip. The  $V_{DD}$  power supply should be bypassed to ground using at least four 0.1 µF-bypass capacitors located as close as possible to the four sides of the package. The capacitor leads and associated printed circuit traces connecting to chip  $V_{DD}$  and GND should be kept to less than half an inch per capacitor lead. A four-layer board employing two inner layers as  $V_{CC}$  and GND planes is recommended.

All output pins on the MPC860 have fast rise and fall times. Printed circuit (PC) trace interconnection length should be minimized in order to minimize undershoot and reflections caused by these fast output switching times. This recommendation particularly applies to the address and data buses. Maximum PC trace lengths of 6 inches are recommended. Capacitance calculations should consider all device loads as well as parasitic capacitances due to the PC traces. Attention to proper PCB layout and bypassing becomes especially critical in systems with higher capacitive loads because these loads create higher transient currents in the  $V_{CC}$  and GND circuits. Pull up all unused inputs or signals that will be inputs during reset. Special care should be taken to minimize the noise levels on the PLL supply pins.

Table 7 provides the bus operation timing for the MPC860 at 33, 40, 50, and 66 MHz.

The maximum bus speed supported by the MPC860 is 66 MHz. Higher-speed parts must be operated in half-speed bus mode (for example, an MPC860 used at 80 MHz must be configured for a 40-MHz bus).

The timing for the MPC860 bus shown assumes a 50-pF load for maximum delays and a 0-pF load for minimum delays.

<sup>1</sup> Phase and frequency jitter performance results are only valid if the input jitter is less than the prescribed value.

<sup>2</sup> If the rate of change of the frequency of EXTAL is slow (that is, it does not jump between the minimum and maximum values in one cycle) or the frequency of the jitter is fast (that is, it does not stay at an extreme value for a long time) then the maximum allowed jitter on EXTAL can be up to 2%.

<sup>3</sup> The timings specified in B4 and B5 are based on full strength clock.

<sup>4</sup> The timing for BR output is relevant when the MPC860 is selected to work with external bus arbiter. The timing for BG output is relevant when the MPC860 is selected to work with internal bus arbiter.

<sup>5</sup> The timing required for BR input is relevant when the MPC860 is selected to work with internal bus arbiter. The timing for BG input is relevant when the MPC860 is selected to work with external bus arbiter.

<sup>6</sup> The D(0:31) and DP(0:3) input timings B18 and B19 refer to the rising edge of the CLKOUT in which the TA input signal is asserted.

<sup>7</sup> The D(0:31) and DP(0:3) input timings B20 and B21 refer to the falling edge of the CLKOUT. This timing is valid only for read accesses controlled by chip-selects under control of the UPM in the memory controller, for data beats where DLT3 = 1 in the UPM RAM words. (This is only the case where data is latched on the falling edge of CLKOUT.)

<sup>8</sup> The timing B30 refers to  $\overline{CS}$  when ACS = 00 and to  $\overline{WE}(0:3)$  when CSNT = 0.

<sup>9</sup> The signal UPWAIT is considered asynchronous to the CLKOUT and synchronized internally. The timings specified in B37 and B38 are specified to enable the freeze of the UPM output signals as described in Figure 18.

<sup>10</sup> The AS signal is considered asynchronous to the CLKOUT. The timing B39 is specified in order to allow the behavior specified in Figure 21.

#### MPC860 PowerQUICC<sup>™</sup> Family Hardware Specifications, Rev. 8

Table 8 provides interrupt timing for the MPC860.

| Num | Characteristic <sup>1</sup>                   | All Freq                | uencies | Unit |
|-----|---|-------------------------|---------|------|
| Num | Characteristic                                | Min                     | Мах     | Unit |
| 139 | IRQx valid to CLKOUT rising edge (setup time) | 6.00                    | —       | ns   |
| 140 | IRQx hold time after CLKOUT                   | 2.00                    | —       | ns   |
| 141 | IRQx pulse width low                          | 3.00                    | —       | ns   |
| 142 | IRQx pulse width high                         | 3.00                    | —       | ns   |
| 143 | IRQx edge-to-edge time                        | $4 \times T_{CLOCKOUT}$ | —       | —    |

The timings I39 and I40 describe the testing conditions under which the IRQ lines are tested when being defined as level-sensitive. The IRQ lines are synchronized internally and do not have to be asserted or negated with reference to the CLKOUT.

The timings I41, I42, and I43 are specified to allow the correct function of the IRQ lines detection circuitry and have no direct relation with the total system interrupt latency that the MPC860 is able to support.

Figure 23 provides the interrupt detection timing for the external level-sensitive lines.

Figure 23. Interrupt Detection Timing for External Level Sensitive Lines

Figure 24 provides the interrupt detection timing for the external edge-sensitive lines.

| P51 | CLKOUT to PCOE, IORD, PCWE, IOWR negate time               | 2.00   | 11.00 | 2.00   | 11.00 | 2.00   | 11.00 | 2.00   | 11.00 | ns  |
| P52 | CLKOUT to ALE assert time                                  | 7.58   | 15.58 | 6.25   | 14.25 | 5.00   | 13.00 | 3.79   | 10.04 | ns  |
| P53 | CLKOUT to ALE negate time                                  | —      | 15.58 |        | 14.25 | —      | 13.00 | —      | 11.84 | ns  |
| P54 | PCWE, IOWR negated to D(0:31) invalid <sup>1</sup>         | 5.58   |       | 4.25   | _     | 3.00   | —     | 1.79   | _     | ns  |
| P55 | WAITA and WAITB valid to CLKOUT rising edge <sup>1</sup>   | 8.00   | _     | 8.00   | _     | 8.00   | —     | 8.00   | _     | ns  |
| P56 | CLKOUT rising edge to WAITA and WAITB invalid <sup>1</sup> | 2.00   | —     | 2.00   | —     | 2.00   | —     | 2.00   | —     | ns  |

<sup>1</sup> PSST = 1. Otherwise add PSST times cycle time.

PSHT = 0. Otherwise add PSHT times cycle time.

These synchronous timings define when the  $\overline{\text{WAITx}}$  signals are detected in order to freeze (or relieve) the PCMCIA current cycle. The  $\overline{\text{WAITx}}$  assertion will be effective only if it is detected 2 cycles before the PSL timer expiration. See Chapter 16, "PCMCIA Interface," in the *MPC860 PowerQUICC*<sup>TM</sup> Family User's Manual.

| 83  | L1RCLK, L1TCLK width low (DSC = 1)                       | P + 10   | _                     | ns   |
| 83a | L1RCLK, L1TCLK width high (DSC = $1$ ) <sup>3</sup>      | P + 10   | —                     | ns   |

## Table 19. SI Timing

## MPC860 PowerQUICC™ Family Hardware Specifications, Rev. 8

#### **CPM Electrical Characteristics**

| Num | Oh anna taola tha   | All Frequencies |       | Unit       |
|-----|---|-----------------|-------|------------|
|     | Characteristic  | Min             | Max   | – Unit     |
| 84  | L1CLK edge to L1CLKO valid (DSC = 1)                                | _               | 30.00 | ns         |
| 85  | LIRQ valid before falling edge of L1TSYNC <sup>4</sup>              | 1.00            | —     | L1TCL<br>K |
| 86  | L1GR setup time <sup>2</sup>  | 42.00           | —     | ns         |
| 87  | L1GR hold time  | 42.00           | —     | ns         |
| 88  | L1CLK edge to L1SYNC valid (FSD = 00) CNT = 0000, BYT = 0, DSC = 0) | —               | 0.00  | ns         |

Table 19. SI Timing (continued)

<sup>1</sup> The ratio SYNCCLK/L1RCLK must be greater than 2.5/1.

<sup>2</sup> These specs are valid for IDL mode only.

<sup>3</sup> Where P = 1/CLKOUT. Thus, for a 25-MHz CLKO1 rate, P = 40 ns.

<sup>4</sup> These strobes and TxD on the first bit of the frame become valid after L1CLK edge or L1SYNC, whichever comes later.

**CPM Electrical Characteristics** 

# **11.11 SPI Slave AC Electrical Specifications**

Table 25 provides the SPI slave timings as shown in Figure 67 and Figure 68.

## Table 25. SPI Slave Timing

| Num   | Characteristic  | All Frequencies |     | Unit             |
|-------|---|-----------------|-----|------------------|
| Nulli |   | Min             | Мах | Unit             |
| 170   | Slave cycle time  | 2               | —   | t <sub>cyc</sub> |
| 171   | Slave enable lead time                                      | 15              | —   | ns               |
| 172   | Slave enable lag time                                       | 15              | —   | ns               |
| 173   | Slave clock (SPICLK) high or low time                       | 1               | —   | t <sub>cyc</sub> |
| 174   | Slave sequential transfer delay (does not require deselect) | 1               | —   | t <sub>cyc</sub> |
| 175   | Slave data setup time (inputs)                              | 20              | —   | ns               |
| 176   | Slave data hold time (inputs)                               | 20              | —   | ns               |
| 177   | Slave access time   | _               | 50  | ns               |

#### **CPM Electrical Characteristics**

## MPC860 PowerQUICC<sup>™</sup> Family Hardware Specifications, Rev. 8

# 11.12 I<sup>2</sup>C AC Electrical Specifications

Table 26 provides the  $I^2C$  (SCL < 100 kHz) timings.

## Table 26. I<sup>2</sup>C Timing (SCL < 100 kHz)

| Num | Characteristic                            | All Frequencies |     | Unit |
|-----|---|-----------------|-----|------|
| Num |   | Min             | Max |      |
| 200 | SCL clock frequency (slave)               | 0               | 100 | kHz  |
| 200 | SCL clock frequency (master) <sup>1</sup> | 1.5             | 100 | kHz  |
| 202 | Bus free time between transmissions       | 4.7             | —   | μs   |
| 203 | Low period of SCL                         | 4.7             | —   | μs   |
| 204 | High period of SCL                        | 4.0             | —   | μs   |
| 205 | Start condition setup time                | 4.7             | —   | μs   |
| 206 | Start condition hold time                 | 4.0             | —   | μs   |
| 207 | Data hold time                            | 0               | —   | μs   |
| 208 | Data setup time                           | 250             | —   | ns   |
| 209 | SDL/SCL rise time                         | —               | 1   | μs   |
| 210 | SDL/SCL fall time                         | _               | 300 | ns   |
| 211 | Stop condition setup time                 | 4.7             | —   | μs   |

SCL frequency is given by SCL = BRGCLK\_frequency / ((BRG register + 3 × pre\_scaler × 2). The ratio SYNCCLK/(BRGCLK/pre\_scaler) must be greater than or equal to 4/1.

## Table 27 provides the $I^2C$ (SCL > 100 kHz) timings.

## Table 27. . I<sup>2</sup>C Timing (SCL > 100 kHz)

| Num | Characteristic                            | Expression | All Freq        | Unit          |      |
|-----|---|------------|-----------------|---------------|------|
| Num | Characteristic                            | Expression | Min             | Мах           | Omit |
| 200 | SCL clock frequency (slave)               | fSCL       | 0               | BRGCLK/48     | Hz   |
| 200 | SCL clock frequency (master) <sup>1</sup> | fSCL       | BRGCLK/16512    | BRGCLK/48     | Hz   |
| 202 | Bus free time between transmissions       |            | 1/(2.2 * fSCL)  | —             | s    |
| 203 | Low period of SCL                         |            | 1/(2.2 * fSCL)  | —             | s    |
| 204 | High period of SCL                        |            | 1/(2.2 * fSCL)  | —             | S    |
| 205 | Start condition setup time                |            | 1/(2.2 * fSCL)  | _             | S    |
| 206 | Start condition hold time                 |            | 1/(2.2 * fSCL)  | —             | s    |
| 207 | Data hold time                            |            | 0               | —             | S    |
| 208 | Data setup time                           |            | 1/(40 * fSCL)   | —             | s    |
| 209 | SDL/SCL rise time                         |            | —               | 1/(10 * fSCL) | S    |
| 210 | SDL/SCL fall time                         |            | —               | 1/(33 * fSCL) | S    |
| 211 | Stop condition setup time                 |            | 1/2(2.2 * fSCL) | _             | S    |

SCL frequency is given by SCL = BRGCLK\_frequency / ((BRG register + 3)  $\times$  pre\_scaler  $\times$  2). The ratio SYNCCLK/(BRGCLK / pre\_scaler) must be greater than or equal to 4/1.

# **12 UTOPIA AC Electrical Specifications**

Table 28 shows the AC electrical specifications for the UTOPIA interface.

| Num | Signal Characteristic  | Direction | Min | Max | Unit |
|-----|--|-----------|-----|-----|------|
| U1  | UtpClk rise/fall time (Internal clock option)                          | Output    | _   | 3.5 | ns   |
|     | Duty cycle   |           | 50  | 50  | %    |
|     | Frequency  |           | _   | 50  | MHz  |
| U1a | UtpClk rise/fall time (external clock option)                          | Input     | _   | 3.5 | ns   |
|     | Duty cycle   |           | 40  | 60  | %    |
|     | Frequency  |           | _   | 50  | MHz  |
| U2  | RxEnb and TxEnb active delay   | Output    | 2   | 16  | ns   |
| U3  | UTPB, SOC, Rxclav and Txclav setup time                                | Input     | 8   | —   | ns   |
| U4  | UTPB, SOC, Rxclav and Txclav hold time                                 | Input     | 1   | —   | ns   |
| U5  | UTPB, SOC active delay (and PHREQ and PHSEL active delay in MPHY mode) | Output    | 2   | 16  | ns   |

Table 28. UTOPIA AC Electrical Specifications

Figure 70 shows signal timings during UTOPIA receive operations.

Figure 70. UTOPIA Receive Timing

Figure 71 shows signal timings during UTOPIA transmit operations.

Figure 71. UTOPIA Transmit Timing

# **13 FEC Electrical Characteristics**

This section provides the AC electrical specifications for the Fast Ethernet controller (FEC). Note that the timing specifications for the MII signals are independent of system clock frequency (part speed designation). Also, MII signals use TTL signal levels compatible with devices operating at either 5.0 V or 3.3 V.

# 13.1 MII Receive Signal Timing (MII\_RXD[3:0], MII\_RX\_DV, MII\_RX\_ER, MII\_RX\_CLK)

The receiver functions correctly up to a MII\_RX\_CLK maximum frequency of 25 MHz + 1%. There is no minimum frequency requirement. In addition, the processor clock frequency must exceed the MII\_RX\_CLK frequency -1%.

Table 29 provides information on the MII receive signal timing.

| Num | Characteristic   | Min | Max | Unit                 |
|-----|--|-----|-----|----------------------|
| M1  | MII_RXD[3:0], MII_RX_DV, MII_RX_ER to MII_RX_CLK setup | 5   | -   | ns                   |
| M2  | MII_RX_CLK to MII_RXD[3:0], MII_RX_DV, MII_RX_ER hold  | 5   |     | ns                   |
| M3  | MII_RX_CLK pulse width high                            | 35% | 65% | MII_RX_CLK<br>period |
| M4  | MII_RX_CLK pulse width low                             | 35% | 65% | MII_RX_CLK<br>period |

## Table 29. MII Receive Signal Timing

Figure 72 shows MII receive signal timing.

Figure 72. MII Receive Signal Timing Diagram

## MPC860 PowerQUICC<sup>™</sup> Family Hardware Specifications, Rev. 8

# 13.2 MII Transmit Signal Timing (MII\_TXD[3:0], MII\_TX\_EN, MII\_TX\_ER, MII\_TX\_CLK)

The transmitter functions correctly up to a MII\_TX\_CLK maximum frequency of 25 MHz +1%. There is no minimum frequency requirement. In addition, the processor clock frequency must exceed the MII\_TX\_CLK frequency -1%.

Table 30 provides information on the MII transmit signal timing.

| Table 30 | . MII | Transmit | Signal | Timing |
|----------|-------|----------|--------|--------|
|----------|-------|----------|--------|--------|

| Num | Characteristic   | Min | Мах | Unit                 |
|-----|--|-----|-----|----------------------|
| M5  | MII_TX_CLK to MII_TXD[3:0], MII_TX_EN, MII_TX_ER invalid | 5   | _   | ns                   |
| M6  | MII_TX_CLK to MII_TXD[3:0], MII_TX_EN, MII_TX_ER valid   | —   | 25  |                      |
| M7  | MII_TX_CLK pulse width high                              | 35  | 65% | MII_TX_CLK<br>period |
| M8  | MII_TX_CLK pulse width low                               | 35% | 65% | MII_TX_CLK<br>period |

Figure 73 shows the MII transmit signal timing diagram.

Figure 73. MII Transmit Signal Timing Diagram

**FEC Electrical Characteristics** 

# 13.3 MII Async Inputs Signal Timing (MII\_CRS, MII\_COL)

Table 31 provides information on the MII async inputs signal timing.

Table 31. MII Async Inputs Signal Timing

| Num | Characteristic                       | Min | Max | Unit                 |
|-----|--------------------------------------|-----|-----|----------------------|
| M9  | MII_CRS, MII_COL minimum pulse width | 1.5 |     | MII_TX_CLK<br>period |

Figure 74 shows the MII asynchronous inputs signal timing diagram.

# 13.4 MII Serial Management Channel Timing (MII\_MDIO, MII\_MDC)

Table 32 provides information on the MII serial management channel signal timing. The FEC functions correctly with a maximum MDC frequency in excess of 2.5 MHz. The exact upper bound is under investigation.

| Num | Characteristic  | Min | Мах | Unit              |
|-----|---|-----|-----|-------------------|
| M10 | MII_MDC falling edge to MII_MDIO output invalid (minimum propagation delay) | 0   | —   | ns                |
| M11 | MII_MDC falling edge to MII_MDIO output valid (max prop delay)              | _   | 25  | ns                |
| M12 | MII_MDIO (input) to MII_MDC rising edge setup                               | 10  | —   | ns                |
| M13 | MII_MDIO (input) to MII_MDC rising edge hold                                | 0   | —   | ns                |
| M14 | MII_MDC pulse width high  | 40% | 60% | MII_MDC<br>period |
| M15 | MII_MDC pulse width low   | 40% | 60% | MII_MDC<br>period |

## Table 32. MII Serial Management Channel Timing

Mechanical Data and Ordering Information

## 14.2 Mechanical Dimensions of the PBGA Package

Figure 77 shows the mechanical dimensions of the ZP PBGA package.

- 2. Dimensions in millimeters.
- 3. Dimension b is the maximum solder ball diameter measured parallel to data C.

Figure 78 shows the mechanical dimensions of the ZQ PBGA package.

1. All Dimensions in millimeters.

- 2. Dimensions and tolerance per ASME Y14.5M, 1994.
- 3. Maximum Solder Ball Diameter measured parallel to Datum A.
- 4. Datum A, the seating plane, is defined by the spherical crowns of the solder balls.

# **15 Document Revision History**

Table 35 lists significant changes between revisions of this hardware specification.

| Revision | Date    | Changes  |
|----------|---------|--|
| 5.1      | 11/2001 | Revised template format, removed references to MAC functionality, changed Table 7 B23 max value @ 66 MHz from 2ns to 8ns, added this revision history table  |
| 6        | 10/2002 | Added the MPC855T. Corrected Figure 26 on page -36.  |
| 6.1      | 11/2002 | <ul> <li>Corrected UTOPIA RXenb* and TXenb* timing values</li> <li>Changed incorrect usage of Vcc to Vdd</li> <li>Corrected dual port RAM to 8 Kbytes</li> </ul>   |
| 6.2      | 8/2003  | <ul> <li>Changed B28a through B28d and B29d to show that TRLX can be 0 or 1</li> <li>Changed reference documentation to reflect the Rev 2 MPC860 PowerQUICC Family Users Manual</li> <li>Nontechnical reformatting</li> </ul>  |
| 6.3      | 9/2003  | • Added Section 11.2 on the Port C interrupt pins     •Nontechnical reformatting   |
| 7.0      | 9/2004  | <ul> <li>Added a tablefootnote to Table 6 DC Electrical Specifications about meeting the VIL Max of the I2C Standard</li> <li>Replaced the thermal characteristics in Table 4 by the ZQ package</li> <li>Add the new parts to the Ordering and Availability Chart in Table 34</li> <li>Added the mechanical spec of the ZQ package in Figure 78</li> <li>Removed all of the old revisions from Table 5</li> </ul>  |
| 8        | 08/2007 | <ul> <li>Updated template.</li> <li>On page 1, added a second paragraph.</li> <li>After Table 2, inserted a new figure showing the undershoot/overshoot voltage (Figure 1) and renumbered the rest of the figures.</li> <li>In Figure 3, changed all reference voltage measurement points from 0.2 and 0.8 V to 50% level.</li> <li>In Table 16, changed num 46 description to read, "TA assertion to rising edge"</li> <li>In Figure 46, changed TA to reflect the rising edge of the clock.</li> </ul> |
