

## FEATURES

256K x 16 MRAM Memory

- Fast 35 ns Read/Write Cycle
- SRAM Compatible Timing, Uses Existing SRAM Controllers Without Redesign
- Unlimited Read & Write Endurance
- Data Non-volatile for >20-years at Temperature
- One Memory Replaces Flash, SRAM, EEPROM and BBSRAM in System for Simpler, More Efficient Design
- Replace battery-backed SRAM solutions with MRAM to improve reliability
- 3.3 Volt Power Supply
- Automatic Data Protection on Power Loss
- Commercial, Industrial, Extended Temperatures
- **RoHS-Compliant** SRAM TSOPII Package
- **RoHS-Compliant** SRAM BGA Package Shrinks Board Area By Three Times

## INTRODUCTION

The **MR2A16A** is a 4,194,304-bit magnetoresistive random access memory (MRAM) device organized as 262,144 words of 16 bits. The **MR2A16A** offers SRAM compatible 35 ns read/write timing with unlimited endurance. Data is always non-volatile for greater than 20-years. Data is automatically protected on power loss by low-voltage inhibit circuitry to prevent writes with voltage out of specification. The **MR2A16A** is the ideal memory solution for applications that must permanently store and retrieve critical data and programs quickly.

The **MR2A16A** is available in small footprint 400-mil, 44-lead plastic small-outline TSOP type-II package or 8 mm x 8 mm, 48-pin ball grid array (BGA) package with 0.75 mm ball centers. These packages are compatible with similar low-power SRAM products and other non-volatile RAM products.

The **MR2A16A** provides highly reliable data storage over a wide range of temperatures. The product is offered with commercial temperature (0 to +70 °C), industrial temperature (-40 to +85 °C), and extended temperature (-40 to +105 °C) range options.

## 2. ELECTRICAL SPECIFICATIONS

### Absolute Maximum Ratings

This device contains circuitry to protect the inputs against damage caused by high static voltages or electric fields; however, it is advised that normal precautions be taken to avoid application of any voltage greater than maximum rated voltages to these high-impedance (Hi-Z) circuits.

The device also contains protection against external magnetic fields. Precautions should be taken to avoid application of any magnetic field more intense than the maximum field intensity specified in the maximum ratings.

**Table 2.1 Absolute Maximum Ratings<sup>1</sup>**

Parameter	Symbol	Value	Unit
Supply voltage <sup>2</sup>	$V_{DD}$	-0.5 to 4.0	V
Voltage on an pin <sup>2</sup>	$V_{IN}$	-0.5 to $V_{DD} + 0.5$	V
Output current per pin	$I_{OUT}$	$\pm 20$	mA
Package power dissipation	$P_D$	0.600	W
Temperature under bias MR2A16A (Commercial) MR2A16AC (Industrial) MR2A16AV (Extended)	$T_{BIAS}$	-10 to 85 -45 to 95 -45 to 110	°C
Storage Temperature	$T_{stg}$	-55 to 150	°C
Lead temperature during solder (3 minute max)	$T_{Lead}$	260	°C
Maximum magnetic field during write MR2A16A (All Temperatures)	$H_{max\_write}$	2000	A/m
Maximum magnetic field during read or standby	$H_{max\_read}$	8000	A/m

<sup>1</sup> Permanent device damage may occur if absolute maximum ratings are exceeded. Functional operation should be restricted to recommended operating conditions. Exposure to excessive voltages or magnetic fields could affect device reliability.

<sup>2</sup> All voltages are referenced to  $V_{SS}$ .

<sup>3</sup> Power dissipation capability depends on package characteristics and use environment.

Table 2.2 Operating Conditions

Parameter	Symbol	Value	Typical	Max	Unit
Power supply voltage	$V_{DD}$	3.0 <sup>i</sup>	3.3	3.6	V

Temperature under bias MR2A16A (Commercial) MR2A16AC (Industrial) MR2A16AV (Extended)	$T_A$	0 -40 -40		70 85 105	°C

<sup>i</sup> There is a 2 ms startup time once  $V_{DD}$  exceeds  $V_{DD}(max)$ . See **Power Up and Power Down Sequencing** below.

<sup>ii</sup>  $V_{IH}(max) = V_{DD} + 0.3 V_{DC}$ ;  $V_{IH}(max) = V_{DD} + 2.0 V_{AC}$  (pulse width  $\leq 10$  ns) for  $I \leq 20.0$  mA.

<sup>iii</sup>  $V_{IL}(min) = -0.5 V_{DC}$ ;  $V_{IL}(min) = -2.0 V_{AC}$  (pulse width  $\leq 10$  ns) for  $I \leq 20.0$  mA.

### Power Up and Power Down Sequencing

MRAM is protected from write operations whenever  $V_{DD}$  is less than  $V_{WI}$ . As soon as  $V_{DD}$  exceeds  $V_{DD}(min)$ , there is a startup time of 2 ms before read or write operations can start. This time allows memory power supplies to stabilize.

The  $\overline{E}$  and  $\overline{W}$  control signals should track  $V_{DD}$  on power up to  $V_{DD} - 0.2$  V or  $V_{IH}$  (whichever is lower) and remain high for the startup time. In most systems, this means that these signals should be pulled up with a resistor so that signal remains high if the driving signal is Hi-Z during power up. Any logic that drives  $\overline{E}$  and  $\overline{W}$  should hold the signals high with a power-on reset signal for longer than the startup time.

During power loss or brownout where  $V_{DD}$  goes below  $V_{WI}$ , writes are protected and a startup time must be observed when power returns above  $V_{DD}(min)$ .

<sup>1</sup> All write occurs during the overlap of  $\overline{E}$  low and  $\overline{W}$  low. Power supplies must be properly grounded and decoupled and bus contention conditions must be minimized or eliminated during read and write cycles. If  $\overline{G}$  goes low at the same time or after  $\overline{W}$  goes low, the output will remain in a high impedance state. After  $\overline{W}$ ,  $\overline{E}$  or  $\overline{UB}/\overline{LB}$  has been brought high, the signal must remain in steady-state high for a minimum of 2 ns. The minimum time between  $\overline{E}$  being asserted low in one cycle to  $\overline{E}$  being asserted low in a subsequent cycle is the same as the minimum cycle time allowed for the device.

<sup>2</sup> All write cycle timings are referenced from the last valid address to the first transition address.

<sup>3</sup> This parameter is sampled and not 100% tested. Transition is measured  $\pm 200$  mV from the steady-state voltage. At any given voltage or temperature,  $t_{WLQZ}(\max) < t_{WHQX}(\min)$

## 6. REVISION HISTORY

Revision	Date	Description of Change
4	Jun 18, 2007	Added new industrial and extended temperature product information; updated part ordering information; changed to 2 ms delay after power up; power supply characteristics values updated to TBD for industrial and extended temperature devices.
5	Sept 21, 2007	Changed MR2A16ATS35C product description to Legacy Commercial. Added the New Commercial temperature product (MR2A16AYS35) information. Table 3: MR2A16AYS35 Hmax-write=25 Oe. Table 4: MR2A16AYS35 has a 2 ms power up waiting period. Table 6: Applied values to TBD's in IDD specifications.
6	Nov 12, 2007	Table 2: Changed IDDA to IDDR or IDDW. Table 13: Added note indicating that TS and YS are both valid package codes. Current Part Numbering System: Added commercial (missing letter) temperature range.
7	Sep 12, 2008	Reformat Datasheet for EverSpin, Add BGA Packaging Information, Add Tape & Reel Part Numbers, Add Power Sequencing Info, Correct IOH spec of VOH to -100 uA, Correct ac Test Conditions.
8	July 22, 2009	Add TSOPII Lead Cross-Section, Add Production Note. Converted to new document format.

Unless Otherwise Noted, This is a Production Product - This product conforms to specifications per the terms of the Everspin standard warranty. The product has completed Everspin internal qualification testing and has reached production status.
