## THIS SPEC IS OBSOLETE

Spec No: 38-03027
Spec Title: PALCE22V10 FLASH-ERASABLE REPROGRAMMABLE CMOS PAL(R) DEVICE
Sunset Owner: Adrian Mendes (AMV)
Replaced by: None

## Features

- Low power
- 90 mA max. commercial (10 ns)
- 130 mA max. commercial ( 5 ns )
- CMOS Flash EPROM technology for electrical erasability and reprogrammability
- Variable product terms
$-2 \times(8$ through 16) product terms
- User-programmable macrocell
— Output polarity control
- Individually selectable for registered or combinatorial operation
- Up to $\mathbf{2 2}$ input terms and 10 outputs

## Flash-erasable Reprogrammable CMOS PAL ${ }^{\circledR}$ Device

- DIP, LCC, and PLCC available
- 5 ns commercial version
$4 \mathrm{~ns} \mathrm{t}_{\mathrm{co}}$
3 ns $\mathrm{t}_{\mathrm{s}}$
5 ns tpD
181-MHz state machine
- 10 ns military and industrial versions

7 ns $\mathrm{t}_{\mathrm{co}}$
6 ns ts 10 ns $t_{\text {PD }}$ $110-\mathrm{MHz}$ state machine

- 15-ns commercial, industrial, and military versions
- 25-ns commercial, industrial, and military versions
- High reliability
- Proven Flash EPROM technology
- 100\% programming and functional testing

## Functional Description

The Cypress PALCE22V10 is a CMOS Flash-erasable second-generation programmable array logic device. It is implemented with the familiar sum-of-products (AND-OR) logic structure and the programmable macrocell.
The PALCE22V10 is executed in a 24 -pin 300 -mil molded DIP, a 300 -mil cerDIP, a 28 -lead square ceramic leadless chip carrier, a 28 -lead square plastic leaded chip carrier, and provides up to 22 inputs and 10 outputs. The PALCE22V10 can be electrically erased and reprogrammed. The programmable macrocell provides the capability of defining the architecture of each output individually. Each of the ten potential outputs may be specified as "registered" or "combinatorial." Polarity of each output may also be individually selected, allowing complete flexibility of output configuration. Further configurability is provided through "array" configurable "output enable" for each potential output. This feature allows the 10 outputs to be reconfigured as inputs on an individual basis, or alternately used as a combination I/O controlled by the programmable array.
PALCE22V10 features a variable product term architecture. There are 5 pairs of product term sums beginning at 8 product terms per output and incrementing by 2 to 16 product terms per output. By providing this variable structure, the PALCE22V10 is optimized to the configurations found in a majority of applications without creating devices that burden the product term structures with unusable product terms and lower performance.
Additional features of the Cypress PALCE22V10 include a synchronous preset and an asynchronous reset product term. These product terms are common to all macrocells, eliminating the need to dedicate standard product terms for initialization functions. The device automatically resets upon power-up.
The PALCE22V10, featuring programmable macrocells and variable product terms, provides a device with the flexibility to
implement logic functions in the 500- to 800-gate-array complexity. Since each of the ten output pins may be individually configured as inputs on a temporary or permanent basis, functions requiring up to 21 inputs and only a single output and down to twelve inputs and ten outputs are possible. The ten potential outputs are enabled using product terms. Any output pin may be permanently selected as an output or arbitrarily enabled as an output and an input through the selective use of individual product terms associated with each output. Each of these outputs is achieved through an individual programmable macrocell. These macrocells are programmable to provide a combinatorial or registered inverting or non-inverting output. In a registered mode of operation, the output of the register is fed back into the array, providing current status information to the array. This information is available for establishing the next result in applications such as control state machines. In a combinatorial configuration, the combinatorial output or, if the output is disabled, the signal present on the I/O pin is made available to the array. The flexibility provided by both programmable product term control of the outputs and variable product terms allows a significant gain in functional density through the use of programmable logic.
Along with this increase in functional density, the Cypress PALCE22V10 provides lower-power operation through the use of CMOS technology, and increased testability with Flash reprogrammability.

## Configuration Table

## Macrocell

## Maximum Ratings

(Above which the useful life may be impaired. For user guidelines, not tested.)

Storage Temperature ................................. $-65^{\circ} \mathrm{C}$ to $+150^{\circ} \mathrm{C}$
Ambient Temperature with
Power Applied $\qquad$ $-55^{\circ} \mathrm{C}$ to $+125^{\circ} \mathrm{C}$

Supply Voltage to Ground Potential
(Pin 24 to Pin 12)
-0.5 V to +7.0 V
DC Voltage Applied to Outputs
in High-Z State
-0.5 V to +7.0 V
DC Input Voltage
-0.5 V to +7.0 V

Output Current into Outputs (LOW)............................. 16 mA
DC Programming Voltage............................................. 12.5V
Latch-up Current.....................................................> 200 mA
Static Discharge Voltage
(per MIL-STD-883, Method 3015) ............................ >2001V
Operating Range

| Range | Ambient <br> Temperature | V $_{\text {CC }}$ |
| :--- | :---: | :---: |
| Commercial | $0^{\circ} \mathrm{C}$ to $+75^{\circ} \mathrm{C}$ | $5 \mathrm{~V} \pm 5 \%$ |
| Industrial | $-40^{\circ} \mathrm{C}$ to $+85^{\circ} \mathrm{C}$ | $5 \mathrm{~V} \pm 10 \%$ |
| Military ${ }^{[1]}$ | $-55^{\circ} \mathrm{C}$ to $+125^{\circ} \mathrm{C}$ | $5 \mathrm{~V} \pm 10 \%$ |

| :--- | :--- | :--- | :---: | :---: | :---: |
| $\mathrm{C}_{\mathrm{IN}}$ | Input Capacitance | $\mathrm{V}_{\mathrm{IN}}=2.0 \mathrm{~V} @ \mathrm{f}=1 \mathrm{MHz}$ |  | 10 | pF |
| $\mathrm{C}_{\text {OUT }}$ | Output Capacitance | $\mathrm{V}_{\text {OUT }}=2.0 \mathrm{~V} @ \mathrm{f}=1 \mathrm{MHz}$ |  | 10 | pF |

## Endurance Characteristics ${ }^{[6]}$

| Parameter | Description | Test Conditions | Min. | Max. | Unit |
| :--- | :--- | :---: | :---: | :---: | :---: |
| N | Minimum Reprogramming Cycles | Normal Programming Conditions | 100 |  | Cycles |

## Notes:

1. $T_{A}$ is the "instant on" case temperature.
2. See the last page of this specification for Group A subgroup testing information.
3. These are absolute values with respect to device ground. All overshoots due to system or tester noise are included.
4. $\mathrm{V}_{\mathrm{IL}}$ (Min.) is equal to -3.0 V for pulse durations less than 20 ns .
5. Not more than one output should be tested at a time. Duration of the short circuit should not be more than one second. $\mathrm{V}_{\mathrm{OUT}}=0.5 \mathrm{~V}$ has been chosen to avoid test problems caused by tester ground degradation.
6. Tested initially and after any design or process changes that may affect these parameters.

PALCE22V10

Notes:
7. Part (a) of AC Test Loads and Waveforms is used for all parameters except $t_{E R}$ and $t_{E A(+)}$. Part (b) of AC Test Loads and Waveforms is used for $t_{E R}$. Part (c) of $A C$ Test Loads and Waveforms is used for $t_{E A(+)}$
8. Min. times are tested initially and after any design or process changes that may affect these parameters.
9. The test load of (a) of AC Test Loads and Waveforms is used for measuring $t_{E A(-)}$. The test load of (c) of AC Test Loads and Waveforms is used for measuring $t_{E A(+)}$ only Please see (e) of AC Test Loads and Waveforms for enable and disable test waveforms and measurement reference levels.
10. This parameter is measured as the time after output disable input that the previous output data state remains stable on the output. This delay is measured to the point at which a previous HIGH level has fallen to 0.5 V below $\mathrm{V}_{\mathrm{OH}}$ min. or a previous LOW level has risen to 0.5 V above $\mathrm{V}_{\mathrm{OL}} \mathrm{max}$. Please see (e) of AC Test Loads and Waveforms for enable and disable test waveforms and measurement reference levels.

## Notes:

11. This specification indicates the guaranteed maximum frequency at which a state machine configuration with external feedback can operate.
12. This specification indicates the guaranteed maximum frequency at which the device can operate in data path mode.
13. This specification indicates the guaranteed maximum frequency at which a state machine configuration with internal only feedback can operate.
14. This parameter is calculated from the clock period at $f_{M A X}$ internal ( $1 / f_{M A X 3}$ ) as measured (see Note above) minus $t_{s}$.
15. The registers in the PALCE22V10 have been designed with the capability to reset during system power-up. Following power-up, all registers will be reset to a logic LOW state. The output state will depend on the polarity of the output buffer. This feature is useful in establishing state machine initialization. To insure proper operation, the rise in $V_{C C}$ must be monotonic and the timing constraints depicted in Power-Up Reset Waveform must be satisfied.

MILITARY SPECIFICATIONS Group A Subgroup Testing

DC Characteristics

| Parameter | Subgroups |
| :---: | :---: |
| $\mathrm{V}_{\mathrm{OH}}$ | $1,2,3$ |
| $\mathrm{~V}_{\mathrm{OL}}$ | $1,2,3$ |
| $\mathrm{~V}_{\mathrm{IH}}$ | $1,2,3$ |
| $\mathrm{~V}_{\mathrm{IL}}$ | $1,2,3$ |
| $\mathrm{I}_{\mathrm{IX}}$ | $1,2,3$ |
| $\mathrm{I}_{\mathrm{OZ}}$ | $1,2,3$ |

DC Characteristics

| Parameter | Subgroups |
| :---: | :---: |
| $\mathrm{I}_{\mathrm{CC}}$ | $1,2,3$ |

Switching Characteristics

| Parameter | Subgroups |
| :---: | :---: |
| $\mathrm{t}_{\mathrm{PD}}$ | $9,10,11$ |
| $\mathrm{t}_{\mathrm{CO}}$ | $9,10,11$ |
| $\mathrm{t}_{\mathrm{S}}$ | $9,10,11$ |
| $\mathrm{t}_{\mathrm{H}}$ | $9,10,11$ |
