

## Datasheet

### Features

- Single 3.3V Power Supply
- Industrial Temperature Range (–40°C to 110°C) and Military Temperature Range (–55°C to 125°C)
- Symmetrical High-speed Read and Write with Fast Access Time (35 ns)
- Flexible Data Bus Control: 8 bit or 16 bit Access
- Equal Address and Chip-enable Access Times
- Automatic Data Protection with Low-voltage Inhibit Circuitry to Prevent Writes on Power Loss
- All Inputs and Outputs are Transistor-transistor Logic (TTL) Compatible
- Fully Static Operation
- Full Nonvolatile Operation with 20 Years Minimum Data Retention

### Introduction

The EV2A16A is a 4,194,304-bit magnetoresistive random access memory (MRAM) device organized as 262,144 words of 16 bits. The EV2A16A is equipped with chip enable ( $\overline{E}$ ), write enable ( $\overline{W}$ ), and output enable ( $\overline{G}$ ) pins, allowing for significant system design flexibility without bus contention. Because the EV2A16A has separate byte-enable controls ( $\overline{LB}$  and  $\overline{UB}$ ), individual bytes can be written and read.

MRAM is a nonvolatile memory technology that protects data in the event of power loss and does not require periodic refreshing. The EV2A16A is the ideal memory solution for applications that must permanently store and retrieve critical data quickly.

The EV2A16A is available in a 400-mil, 44-lead plastic small-outline TSOP type-II package RoHS compliant (MSL3 according to Jedec standard) with an industry-standard center power and ground SRAM pinout.

The EV2A16A is available in Industrial (–40°C to 110°C) and Military (–55°C to +125°C) temperature ranges.

## 2. Electrical Specifications

### 2.1 Absolute Maximum Ratings

This device contains circuitry to protect the inputs against damage caused by high static voltages or electric fields; however, it is advised that normal precautions be taken to avoid application of any voltage greater than maximum rated voltages to these high-impedance (Hi-Z) circuits.

The device also contains protection against external magnetic fields. Precautions should be taken to avoid application of any magnetic field more intense than the maximum field intensity specified in the maximum ratings.

**Table 2-1.** Absolute Maximum Ratings<sup>(1)</sup>

Parameter	Symbol	Value	Unit
Supply voltage <sup>(2)</sup>	$V_{DD}$	-0.5 to 4.0	V
Voltage on any pin <sup>(2)</sup>	$V_{In}$	-0.5 to $V_{DD} + 0.5$	V
Output current per pin	$I_{Out}$	$\pm 20$	mA
Package power dissipation <sup>(3)</sup>	$P_D$	0.600	W
Temperature under bias	$T_{Bias}$	-55 to 125	°C
Storage temperature	$T_{stg}$	-55 to 150	°C
Lead temperature during solder (3 minute max)	$T_{Lead}$	260	°C
Maximum magnetic field during write	$H_{max\_write}$	2000	A/m
Maximum magnetic field during read or standby	$H_{max\_read}$	8000	A/m

- Notes:
1. Permanent device damage may occur if absolute maximum ratings are exceeded. Functional operation should be restricted to recommended operating conditions. Exposure to excessive voltages or magnetic fields could affect device reliability.
  2. All voltages are referenced to  $V_{SS}$ .
  3. Power dissipation capability depends on package characteristics and use environment.

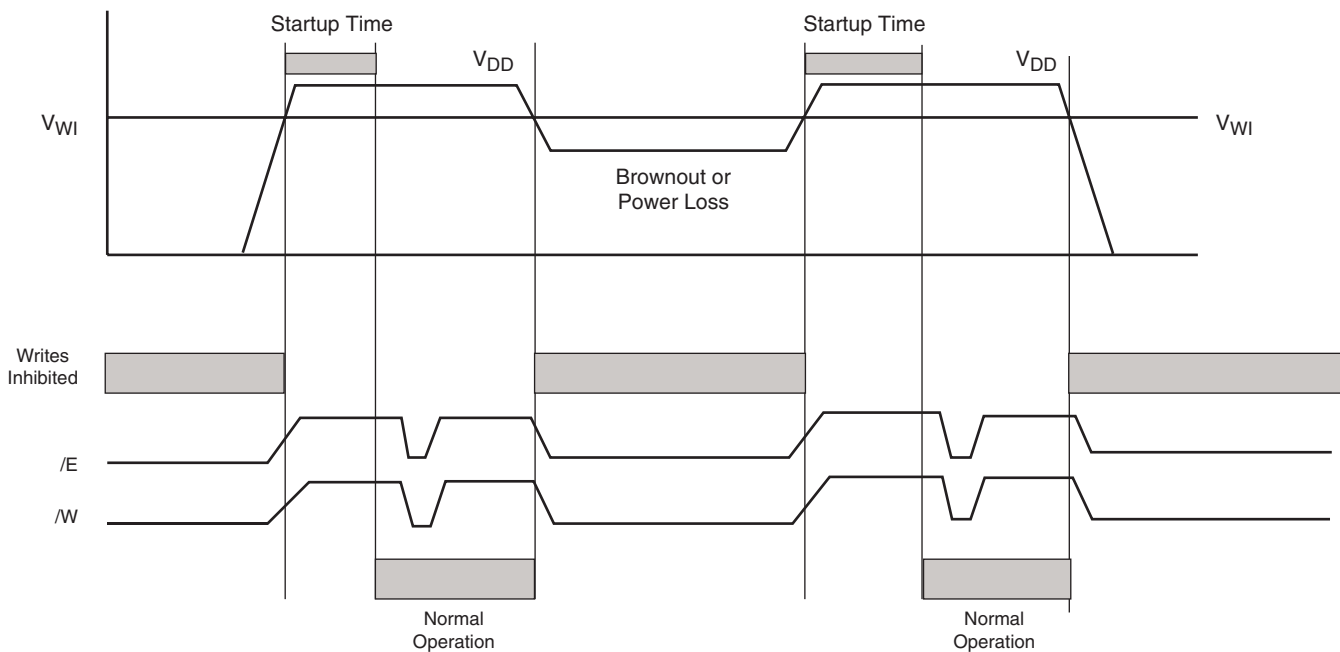

**Table 2-2.** Operating Conditions

Parameter	Symbol	Min	Typ	Max	Unit
Power supply voltage	$V_{DD}$	3.0 <sup>(1)</sup>	3.3	3.6	V
Write inhibit voltage	$V_{WI}$	2.5	2.7	3.0 <sup>(1)</sup>	V
Input high voltage	$V_{IH}$	2.2	–	$V_{DD} + 0.3$ <sup>(2)</sup>	V
Input low voltage	$V_{IL}$	-0.5 <sup>(3)</sup>	–	0.8	V
Operating temperature	T	-40 <sup>(4)</sup> -55 <sup>(4)</sup>		+110 <sup>(5)</sup> +125 <sup>(5)</sup>	°C

- Notes:
1. There is a 2 ms startup time once  $V_{DD}$  exceeds  $V_{DDmin}$ . See powerup and powerdown sequencing section below.
  2.  $V_{IH} (max) = V_{DD} + 0.3 \text{ Vdc}$ ;  $V_{IH} (max) = V_{DD} + 2.0 \text{ Vac}$  (pulse width  $\leq 10 \text{ ns}$ ) for  $I \leq 20.0 \text{ mA}$ .
  3.  $V_{IL} (min) = 0.5 \text{ Vdc}$ ;  $V_{IL} (min) = 2.0 \text{ Vac}$  (pulse width  $\leq 10 \text{ ns}$ ) for  $I \leq 20.0 \text{ mA}$ .
  4. Case temperature
  5. Junction temperature

## 2.2 Power-up and Power-down Sequencing

MRAM is protected from write operations whenever  $V_{DD}$  is less than  $V_{WI}$ . As soon as  $V_{DD}$  exceeds  $V_{DDmin}$ , there is a startup time of 2 ms before read or write operations can start. This time allows memory power supplies to stabilize. The  $/E$  and  $/W$  control signals should track  $V_{DD}$  on power up to  $V_{DD}-0.2\text{V}$  or  $V_{IH}$  (whichever is lower) and remain high for the startup time. In most systems, this means that these signals should be pulled up with a resistor so that signal remains high if the driving signal is Hi-Z during power up. Any logic that drives  $/E$  and  $/W$  should hold the signals high with a power-on reset signal for longer than the startup time. During power loss or brownout where  $V_{DD}$  goes below  $V_{WI}$ , writes are protected and a startup time must be observed when power returns above  $V_{DDmin}$ .

## 2.3 Direct Current (DC)

**Table 2-3.** DC Characteristics

- Notes:
- $\bar{W}$  is high for read cycle.
  - Power supplies must be properly grounded and decoupled, and bus contention conditions must be minimized or eliminated during read and write cycles.
  - Addresses valid before or at the same time  $\bar{E}$  goes low.
  - This parameter is sampled and not 100% tested.
  - Transition is measured  $\pm 200$  mV from steady-state voltage.

Write high to output active <sup>(7)(8)(9)</sup>	$t_{WHQX}$	3	–	ns
Write recovery time	$t_{WHAX}$	12	–	ns

- Notes:
1. A write occurs during the overlap of  $\bar{E}$  low and  $\bar{W}$  low.
  2. Power supplies must be properly grounded and decoupled and bus contention conditions must be minimized or eliminated during read and write cycles.
  3. If  $\bar{G}$  goes low at the same time or after  $\bar{W}$  goes low, the output will remain in a high-impedance state.
  4. After  $\bar{W}$ ,  $\bar{E}$ , or  $\bar{UB}/\bar{LB}$  has been brought high, the signal must remain in steady-state high for a minimum of 2 ns.
  5. The minimum time between  $\bar{E}$  being asserted low in one cycle to  $\bar{E}$  being asserted low in a subsequent cycle is the same as the minimum cycle time allowed for the device.
  6. All write cycle timings are referenced from the last valid address to the first transition address.
  7. This parameter is sampled and not 100% tested.
  8. Transition is measured  $\pm 200$  mV from steady-state voltage.
  9. At any given voltage or temperature,  $t_{WLQZ} \text{ max} < t_{WHQX} \text{ min}$ .
