

## Features

- 25 ns and 45 ns Access Times
- Pin compatible with Industry Standard SRAMs
- Automatic Nonvolatile STORE on power loss
- Nonvolatile STORE under Software Control
- Automatic RECALL to SRAM on Power Up
- Unlimited Read/Write Endurance
- Unlimited RECALL Cycles
- 1,000,000 STORE Cycles
- 100 year Data Retention
- Single 5V±10% Power Supply
- Commercial and Industrial Temperatures
- 28-pin (300 mil and 330 mil) SOIC packages
- RoHS Compliance

## Functional Description

The Cypress STK15C88 is a 256Kb fast static RAM with a nonvolatile element in each memory cell. The embedded nonvolatile elements incorporate QuantumTrap™ technology producing the world's most reliable nonvolatile memory. The SRAM provides unlimited read and write cycles, while independent, nonvolatile data resides in the highly reliable QuantumTrap cell. Data transfers from the SRAM to the nonvolatile elements (the STORE operation) takes place automatically at power down. On power up, data is restored to the SRAM (the RECALL operation) from the nonvolatile memory. Both the STORE and RECALL operations are also available under software control.

PowerStore nvSRAM products depend on the intrinsic system capacitance to maintain system power long enough for an automatic store on power loss. If the power ramp from 5 volts to 3.6 volts is faster than 10 ms, consider our 14C88 or 16C88 for more reliable operation.

## Pin Configurations

**Figure 1. Pin Diagram - 28-Pin SOIC**

**Table 1. Pin Definitions - 28-Pin SOIC**

Pin Name	Alt	I/O Type	Description
A <sub>0</sub> -A <sub>14</sub>		Input	<b>Address Inputs.</b> Used to select one of the 32,768 bytes of the nvSRAM.
DQ <sub>0</sub> -DQ <sub>7</sub>		Input or Output	<b>Bidirectional Data I/O lines.</b> Used as input or output lines depending on operation.
$\overline{WE}$	$\overline{W}$	Input	<b>Write Enable Input, Active LOW.</b> When the chip is enabled and $\overline{WE}$ is LOW, data on the I/O pins is written to the specific address location.
$\overline{CE}$	$\overline{E}$	Input	<b>Chip Enable Input, Active LOW.</b> When LOW, selects the chip. When HIGH, deselects the chip.
$\overline{OE}$	$\overline{S}$	Input	<b>Output Enable, Active LOW.</b> The active LOW $\overline{OE}$ input enables the data output buffers during read cycles. Deasserting $\overline{OE}$ HIGH causes the I/O pins to tristate.
V <sub>SS</sub>		Ground	<b>Ground for the Device.</b> The device is connected to ground of the system.
V <sub>CC</sub>		Power Supply	<b>Power Supply Inputs to the Device.</b>

## Device Operation

The STK15C88 is a versatile memory chip that provides several modes of operation. The STK15C88 can operate as a standard 32K x 8 SRAM. It has a 32K x 8 nonvolatile element shadow to which the SRAM information can be copied, or from which the SRAM can be updated in nonvolatile mode.

### SRAM Read

The STK15C88 performs a READ cycle whenever  $\overline{CE}$  and  $\overline{OE}$  are LOW while  $\overline{WE}$  is HIGH. The address specified on pins  $A_{0-14}$  determines the 32,768 data bytes accessed. When the READ is initiated by an address transition, the outputs are valid after a delay of  $t_{AA}$  (READ cycle 1). If the READ is initiated by  $\overline{CE}$  or  $\overline{OE}$ , the outputs are valid at  $t_{ACE}$  or at  $t_{DOE}$ , whichever is later (READ cycle 2). The data outputs repeatedly respond to address changes within the  $t_{AA}$  access time without the need for transitions on any control input pins, and remains valid until another address change or until  $\overline{CE}$  or  $\overline{OE}$  is brought HIGH.

### SRAM Write

A WRITE cycle is performed whenever  $\overline{CE}$  and  $\overline{WE}$  are LOW. The address inputs must be stable prior to entering the WRITE cycle and must remain stable until either  $\overline{CE}$  or  $\overline{WE}$  goes HIGH at the end of the cycle. The data on the common I/O pins  $DQ_{0-7}$  are written into the memory if it has valid  $t_{SD}$ , before the end of a  $\overline{WE}$  controlled WRITE or before the end of an  $\overline{CE}$  controlled WRITE. Keep  $\overline{OE}$  HIGH during the entire WRITE cycle to avoid data bus contention on common I/O lines. If  $\overline{OE}$  is left LOW, internal circuitry turns off the output buffers  $t_{HZWE}$  after  $\overline{WE}$  goes LOW.

### AutoStore Operation

The STK15C88 uses the intrinsic system capacitance to perform an automatic STORE on power down. As long as the system power supply takes at least  $t_{STORE}$  to decay from  $V_{SWITCH}$  down to 3.6V, the STK15C88 will safely and automatically store the SRAM data in nonvolatile elements on power down.

In order to prevent unneeded STORE operations, automatic STOREs will be ignored unless at least one WRITE operation has taken place since the most recent STORE or RECALL cycle. Software initiated STORE cycles are performed regardless of whether a WRITE operation has taken place.

### Hardware RECALL (Power Up)

During power up or after any low power condition ( $V_{CC} < V_{RESET}$ ), an internal RECALL request is latched. When  $V_{CC}$  once again exceeds the sense voltage of  $V_{SWITCH}$ , a RECALL cycle is automatically initiated and takes  $t_{HRECALL}$  to complete.

If the STK15C88 is in a WRITE state at the end of power up RECALL, the SRAM data is corrupted. To help avoid this situation, a 10 Kohm resistor is connected either between  $\overline{WE}$  and system  $V_{CC}$  or between  $\overline{CE}$  and system  $V_{CC}$ .

## Software STORE

Data is transferred from the SRAM to the nonvolatile memory by a software address sequence. The STK15C88 software STORE cycle is initiated by executing sequential  $\overline{CE}$  controlled READ cycles from six specific address locations in exact order. During the STORE cycle, an erase of the previous nonvolatile data is first performed, followed by a program of the nonvolatile elements. When a STORE cycle is initiated, input and output are disabled until the cycle is completed.

Because a sequence of READs from specific addresses is used for STORE initiation, it is important that no other READ or WRITE accesses intervene in the sequence. If they intervene, the sequence is aborted and no STORE or RECALL takes place.

To initiate the software STORE cycle, the following READ sequence is performed:

1. Read address 0x0E38, Valid READ
2. Read address 0x31C7, Valid READ
3. Read address 0x03E0, Valid READ
4. Read address 0x3C1F, Valid READ
5. Read address 0x303F, Valid READ
6. Read address 0x0FC0, Initiate STORE cycle

The software sequence is clocked with  $\overline{CE}$  controlled READs. When the sixth address in the sequence is entered, the STORE cycle commences and the chip is disabled. It is important that READ cycles and not WRITE cycles are used in the sequence. It is not necessary that  $\overline{OE}$  is LOW for a valid sequence. After the  $t_{STORE}$  cycle time is fulfilled, the SRAM is again activated for READ and WRITE operation.

## Software RECALL

Data is transferred from the nonvolatile memory to the SRAM by a software address sequence. A software RECALL cycle is initiated with a sequence of READ operations in a manner similar to the software STORE initiation. To initiate the RECALL cycle, the following sequence of  $\overline{CE}$  controlled READ operations is performed:

1. Read address 0x0E38, Valid READ
2. Read address 0x31C7, Valid READ
3. Read address 0x03E0, Valid READ
4. Read address 0x3C1F, Valid READ
5. Read address 0x303F, Valid READ
6. Read address 0x0C63, Initiate RECALL cycle

Internally, RECALL is a two step procedure. First, the SRAM data is cleared, and then the nonvolatile information is transferred into the SRAM cells. After the  $t_{RECALL}$  cycle time, the SRAM is once again ready for READ and WRITE operations. The RECALL operation does not alter the data in the nonvolatile elements. The nonvolatile data can be recalled an unlimited number of times.

### Hardware Protect

The STK15C88 offers hardware protection against inadvertent STORE operation and SRAM WRITES during low voltage conditions. When  $V_{CAP} < V_{SWITCH}$ , all externally initiated STORE operations and SRAM WRITES are inhibited.

### Noise Considerations

The STK15C88 is a high speed memory. It must have a high frequency bypass capacitor of approximately 0.1  $\mu\text{F}$  connected between  $V_{CC}$  and  $V_{SS}$ , using leads and traces that are as short as possible. As with all high speed CMOS ICs, careful routing of power, ground, and signals reduce circuit noise.

### Low Average Active Power

CMOS technology provides the STK15C88 the benefit of drawing significantly less current when it is cycled at times longer than 50 ns. Figure 2 and Figure 3 show the relationship between  $I_{CC}$  and READ or WRITE cycle time. Worst case current consumption is shown for both CMOS and TTL input levels (commercial temperature range,  $V_{CC} = 5.5\text{V}$ , 100% duty cycle on chip enable). Only standby current is drawn when the chip is disabled. The overall average current drawn by the STK15C88 depends on the following items:

1. The duty cycle of chip enable
2. The overall cycle rate for accesses
3. The ratio of READs to WRITEs
4. CMOS versus TTL input levels
5. The operating temperature
6. The  $V_{CC}$  level
7. I/O loading

Figure 2. Current Versus Cycle Time (WRITE)

Figure 3. Current Versus Cycle Time (READ)

### Best Practices

nvSRAM products have been used effectively for over 15 years. While ease-of-use is one of the product's main system values, experience gained working with hundreds of applications has resulted in the following suggestions as best practices:

- The nonvolatile cells in an nvSRAM are programmed on the test floor during final test and quality assurance. Incoming inspection routines at customer or contract manufacturer's sites, sometimes, reprogram these values. Final NV patterns are typically repeating patterns of AA, 55, 00, FF, A5, or 5A. End product's firmware should not assume a NV array is in a set programmed state. Routines that check memory content values to determine first time system configuration and cold or warm boot status should always program a unique NV pattern (for example, complex 4-byte pattern of 46 E6 49 53 hex or more random bytes) as part of the final system manufacturing test to ensure these system routines work consistently.
- Power up boot firmware routines should rewrite the nvSRAM into the desired state. While the nvSRAM is shipped in a preset state, best practice is to again rewrite the nvSRAM into the desired state as a safeguard against events that might flip the bit inadvertently (program bugs and incoming inspection routines).

**Table 2. Software STORE/RECALL Mode Selection**

$\overline{CE}$	$\overline{WE}$	A <sub>13</sub> – A <sub>0</sub>	Mode	I/O	Notes
L	H	0x0E38 0x31C7 0x03E0 0x3C1F 0x303F 0x0FC0	Read SRAM Read SRAM Read SRAM Read SRAM Read SRAM Nonvolatile STORE	Output Data Output Data Output Data Output Data Output Data Output Data	[1, 2]
L	H	0x0E38 0x31C7 0x03E0 0x3C1F 0x303F 0x0C63	Read SRAM Read SRAM Read SRAM Read SRAM Read SRAM Nonvolatile RECALL	Output Data Output Data Output Data Output Data Output Data Output Data	[1, 2]

Not recommended for new designs.  
In production to support ongoing production programs only.

**Notes**

1. The six consecutive addresses must be in the order listed.  $\overline{WE}$  must be high during all six consecutive  $\overline{CE}$  controlled cycles to enable a nonvolatile cycle.
2. While there are 15 addresses on the STK15C88, only the lower 14 are used to control software modes.

## Maximum Ratings

Exceeding maximum ratings may shorten the useful life of the device. These user guidelines are not tested.

Storage Temperature ..... -65°C to +150°C  
 Temperature under bias..... -55°C to +125°C  
 Supply Voltage on  $V_{CC}$  Relative to GND ..... -0.5V to 7.0V  
 Voltage on Input Relative to  $V_{SS}$ ..... -0.6V to  $V_{CC} + 0.5V$

Voltage on  $DQ_{0-7}$  ..... -0.5V to  $V_{CC} + 0.5V$   
 Power Dissipation ..... 1.0W  
 DC output Current (1 output at a time, 1s duration) .... 15 mA

## Operating Range

Range	Ambient Temperature	$V_{CC}$
Commercial	0°C to +70°C	4.5V to 5.5V
Industrial	-40°C to +85°C	4.5V to 5.5V

## DC Electrical Characteristics

Over the operating range ( $V_{CC} = 4.5V$  to  $5.5V$ )

Parameter	Description	Test Conditions	Min	Max	Unit
$I_{CC1}$	Average $V_{CC}$ Current	$t_{RC} = 25$ ns $t_{RC} = 45$ ns Dependent on output loading and cycle rate. Values obtained without output loads. $I_{OUT} = 0$ mA.	Commercial	97 70	mA mA
			Industrial	100 70	mA mA
$I_{CC2}$	Average $V_{CC}$ Current during STORE	All Inputs Do Not Care, $V_{CC} = \text{Max}$ Average current for duration $t_{STORE}$		3	mA
$I_{CC3}$	Average $V_{CC}$ Current at $t_{RC} = 200$ ns, 5V, 25°C Typical	$\overline{WE} \geq (V_{CC} - 0.2V)$ . All other inputs cycling. Dependent on output loading and cycle rate. Values obtained without output loads.		10	mA
$I_{CC4}$	Average Current during AutoStore Cycle	All Inputs Do Not Care, $V_{CC} = \text{Max}$ Average current for duration $t_{STORE}$		2	mA
$I_{SB1}^{[3]}$	Average $V_{CC}$ Current (Standby, Cycling TTL Input Levels)	$t_{RC} = 25$ ns, $\overline{CE} \geq V_{IH}$ $t_{RC} = 45$ ns, $CE \geq V_{IH}$	Commercial	30 22	mA mA
			Industrial	31 23	mA mA
$I_{SB2}^{[3]}$	$V_{CC}$ Standby Current (Standby, Stable CMOS Input Levels)	$CE \geq (V_{CC} - 0.2V)$ . All others $V_{IN} \leq 0.2V$ or $\geq (V_{CC} - 0.2V)$ .		1.5	mA
$I_{IX}$	Input Leakage Current	$V_{CC} = \text{Max}$ , $V_{SS} \leq V_{IN} \leq V_{CC}$	-1	+1	$\mu A$
$I_{OZ}$	Off State Output Leakage Current	$V_{CC} = \text{Max}$ , $V_{SS} \leq V_{IN} \leq V_{CC}$ , $\overline{CE}$ or $\overline{OE} \geq V_{IH}$ or $\overline{WE} \leq V_{IL}$	-5	+5	$\mu A$
$V_{IH}$	Input HIGH Voltage		2.2	$V_{CC} + 0.5$	V
$V_{IL}$	Input LOW Voltage		$V_{SS} - 0.5$	0.8	V
$V_{OH}$	Output HIGH Voltage	$I_{OUT} = -4$ mA	2.4		V
$V_{OL}$	Output LOW Voltage	$I_{OUT} = 8$ mA		0.4	V

### Note

3.  $CE \geq V_{IH}$  will not produce standby current levels until any nonvolatile cycle in progress has timed out.

### Data Retention and Endurance

Parameter	Description	Min	Unit
DATA <sub>R</sub>	Data Retention	100	Years
NV <sub>C</sub>	Nonvolatile STORE Operations	1,000	K

### Capacitance

In the following table, the capacitance parameters are listed.<sup>[4]</sup>

Parameter	Description	Test Conditions	Max	Unit
C <sub>IN</sub>	Input Capacitance	T <sub>A</sub> = 25°C, f = 1 MHz, V <sub>CC</sub> = 0 to 3.0 V	5	pF
C <sub>OUT</sub>	Output Capacitance		7	pF

### Thermal Resistance

In the following table, the thermal resistance parameters are listed.<sup>[4]</sup>

Parameter	Description	Test Conditions	28-SOIC (300 mil)	28-SOIC (330 mil)	Unit
Θ <sub>JA</sub>	Thermal Resistance (Junction to Ambient)	Test conditions follow standard test methods and procedures for measuring thermal impedance, per EIA / JESD51.	TBD	TBD	°C/W
Θ <sub>JC</sub>	Thermal Resistance (Junction to Case)		TBD	TBD	°C/W

Figure 4. AC Test Loads

### AC Test Conditions

Input Pulse Levels ..... 0 V to 3 V  
 Input Rise and Fall Times (10% - 90%) ..... ≤5 ns  
 Input and Output Timing Reference Levels ..... 1.5 V

**Note**

4. These parameters are guaranteed by design and are not tested.

## AC Switching Characteristics

### SRAM Read Cycle

Parameter		Description	25 ns		45 ns		Unit
Cypress Parameter	Alt		Min	Max	Min	Max	
$t_{ACE}$	$t_{ELQV}$	Chip Enable Access Time		25		45	ns
$t_{RC}^{[5]}$	$t_{AVAV}, t_{ELEH}$	Read Cycle Time	25		45		ns
$t_{AA}^{[6]}$	$t_{AVQV}$	Address Access Time		25		45	ns
$t_{DOE}$	$t_{GLQV}$	Output Enable to Data Valid		10		20	ns
$t_{OHA}^{[6]}$	$t_{AXQX}$	Output Hold After Address Change	5		5		ns
$t_{LZCE}^{[7]}$	$t_{ELQX}$	Chip Enable to Output Active	5		5		ns
$t_{HZCE}^{[7]}$	$t_{EHQZ}$	Chip Disable to Output Inactive		10		15	ns
$t_{LZOE}^{[7]}$	$t_{GLQX}$	Output Enable to Output Active	0		0		ns
$t_{HZOE}^{[7]}$	$t_{GHQZ}$	Output Disable to Output Inactive		10		15	ns

$t_{HZWE}^{[7,8]}$	$t_{WLQZ}$	Write Enable to Output Disable		10		15	ns
$t_{LZWE}^{[7]}$	$t_{WHQX}$	Output Active After End of Write	5		5		ns

Switching Waveforms

Figure 7. SRAM Write Cycle 1:  $\overline{WE}$  Controlled <sup>[8]</sup>

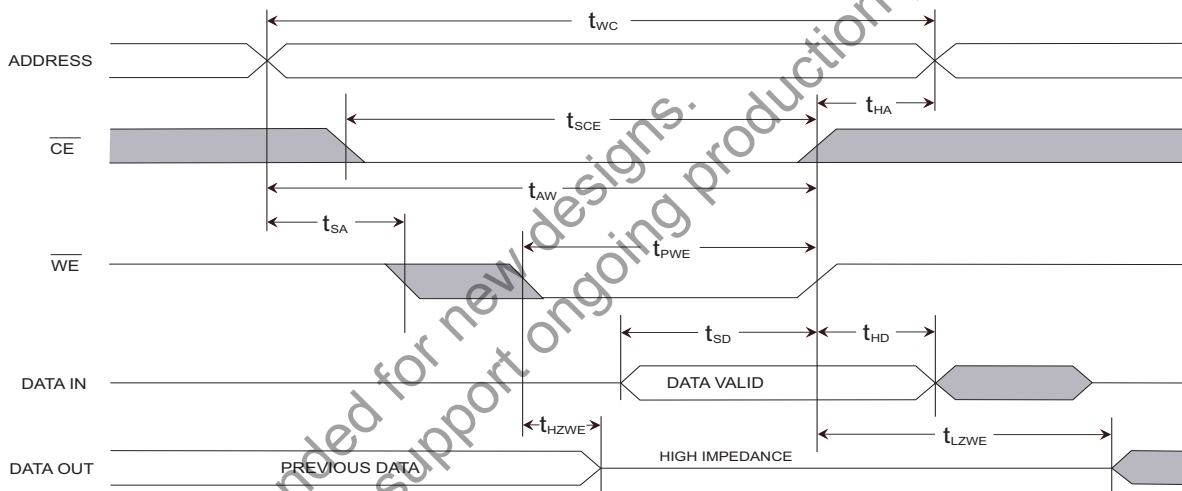

Figure 8. SRAM Write Cycle 2:  $\overline{CE}$  Controlled <sup>[8]</sup>

Notes

- 8. If  $\overline{WE}$  is Low when  $\overline{CE}$  goes Low, the outputs remain in the high impedance state.
- 9. CE or WE must be greater than  $V_{IH}$  during address transitions.

**AutoStore or Power Up RECALL**

Parameter	Alt	Description	STK15C88		Unit
			Min	Max	
$t_{HRECALL}^{[10]}$	$t_{RESTORE}$	Power up RECALL Duration		550	$\mu s$
$t_{STORE}^{[6]}$	$t_{HLHZ}$	STORE Cycle Duration		10	ms
$V_{RESET}$		Low Voltage Reset Level		3.6	V
$V_{SWITCH}$		Low Voltage Trigger Level	4.0	4.5	V

**Switching Waveforms**
**Figure 9. AutoStore/Power Up RECALL**

**Note**

10.  $t_{HRECALL}$  starts from the time  $V_{CC}$  rises above  $V_{SWITCH}$ .

## Software Controlled STORE/RECALL Cycle

The software controlled STORE/RECALL cycle follows. <sup>[11, 12]</sup>

Parameter	Alt	Description	25 ns		45 ns		Unit
			Min	Max	Min	Max	
$t_{RC}$	$t_{AVAV}$	STORE/RECALL Initiation Cycle Time	25		45		ns
$t_{SA}^{[11]}$	$t_{AVEL}$	Address Setup Time	0		0		ns
$t_{CW}^{[11]}$	$t_{ELEH}$	Clock Pulse Width	20		30		ns
$t_{HACE}^{[7, 11]}$	$t_{ELAX}$	Address Hold Time	20		20		ns
$t_{RECALL}$		RECALL Duration		20		20	$\mu$ s

## Switching Waveforms

Figure 10.  $\overline{CE}$  Controlled Software STORE/RECALL Cycle <sup>[12]</sup>

### Notes

- The software sequence is clocked on the falling edge of  $\overline{CE}$  without involving  $\overline{OE}$  (double clocking will abort the sequence).
- The six consecutive addresses must be read in the order listed in the Mode Selection table.  $\overline{WE}$  must be HIGH during all six consecutive cycles.

## Part Numbering Nomenclature

### STK15C88 - N F 45 I TR

## Ordering Information

These parts are not recommended for new designs. They are in production to support ongoing production programs only.

Speed (ns)	Ordering Code	Package Diagram	Package Type	Operating Range

The inclusion of Cypress products in life-support systems application implies that the manufacturer assumes all risk of such use and in doing so indemnifies Cypress against all charges.

Any Source Code (software and/or firmware) is owned by Cypress Semiconductor Corporation (Cypress) and is protected by and subject to worldwide patent protection (United States and foreign), United States copyright laws and international treaty provisions. Cypress hereby grants to licensee a personal, non-exclusive, non-transferable license to copy, use, modify, create derivative works of, and compile the Cypress Source Code and derivative works for the sole purpose of creating custom software and or firmware in support of licensee product to be used only in conjunction with a Cypress integrated circuit as specified in the applicable agreement. Any reproduction, modification, translation, compilation, or representation of this Source Code except as specified above is prohibited without the express written permission of Cypress.

Disclaimer: CYPRESS MAKES NO WARRANTY OF ANY KIND, EXPRESS OR IMPLIED, WITH REGARD TO THIS MATERIAL, INCLUDING, BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE. Cypress reserves the right to make changes without further notice to the materials described herein. Cypress does not assume any liability arising out of the application or use of any product or circuit described herein. Cypress does not authorize its products for use as critical components in life-support systems where a malfunction or failure may reasonably be expected to result in significant injury to the user. The inclusion of Cypress' product in a life-support systems application implies that the manufacturer assumes all risk of such use and in doing so indemnifies Cypress against all charges.

Use may be limited by and subject to the applicable Cypress software license agreement.
