

# 8-LINE TO 3-LINE PRIORITY ENCODER

The MC54/74F148 provides three bits of binary coded output representing the position of the highest order active input, along with an output indicating the presence of any active input. It is easily expanded via input and output enables to provide priority encoding over many bits.

- Encodes Eight Data Lines in Priority
- Provides 3-Bit Binary Priority Code
- Input Enable Capability
- Signals When Data Present on Any Input
- Cascadable for Priority Encoding of n Bits

## FUNCTIONAL DESCRIPTION

The F148 8-input priority encoder accepts data from eight active LOW inputs ( $\bar{I}_0$ – $\bar{I}_7$ ) and provides a binary representation on the three active LOW outputs. A priority is assigned to each input so that when two or more inputs are simultaneously active, the input with the highest priority is represented on the output, with input line 7 having the highest priority. A HIGH on the Enable Input ( $\bar{E}_1$ ) will force all outputs to the inactive (HIGH) state and allow new data to settle without producing

erroneous information at the outputs. A Group Signal output ( $\bar{GS}$ ) and Enable Output ( $\bar{EO}$ ) are provided along with the three priority data outputs ( $\bar{A}_2, \bar{A}_1, \bar{A}_0$ ).  $\bar{GS}$  is active LOW when any input is LOW; this indicates when any input is active.  $\bar{EO}$  is active LOW when all inputs are HIGH. Using the Enable Output along with the Enable Input allows cascading for priority encoding on any number of input signals. Both  $\bar{EO}$  and  $\bar{GS}$  are in the inactive HIGH state when the Enable Input is HIGH.
