100344
Low Power 8-Bit Latch with Cut-Off Drivers

General Description

The 100344 contains eight D-type latches, individual inputs (D_n), outputs (Q_n), a common enable pin ($\overline{E}$), latch enable ($\overline{LE}$), and output enable pin ($\overline{OEN}$). A Q output follows its D input when both $\overline{E}$ and $\overline{LE}$ are LOW. When either $\overline{E}$ or $\overline{LE}$ (or both) are HIGH, a latch stores the last valid data present on its D input prior to $\overline{E}$ or $\overline{LE}$ going HIGH.

A HIGH on $\overline{OEN}$ holds the outputs in a cut-off state. The cut-off state is designed to be more negative than a normal ECL LOW level. This allows the output emitter-followers to turn off when the termination supply is −2.0V, presenting a high impedance to the data bus. This high impedance reduces termination power and prevents loss of low state noise margin when several loads share the bus.

The 100344 outputs are designed to drive a doubly terminated 50Ω transmission line (25Ω load impedance). All inputs have 50 kΩ pull-down resistors.

Note 4: F100K 300 Series cold temperature testing is performed by temperature soaking (to guarantee junction temperature equals −55˚C), then testing immediately without allowing for the junction temperature to stabilize due to heat dissipation after power-up. This provides "cold start" specs which can be considered a worst case condition at cold temperatures.

Note 5: Screen tested 100% on each device at −55˚C, +25˚C, and +125˚C, Subgroups 1, 2, 3, 7, and 8.

Note 6: Sample tested (Method 5005, Table I) on each manufactured lot at −55˚C, +25˚C, and +125˚C, Subgroups A1, 2, 3, 7, and 8.

Note 7: Guaranteed by applying specified input condition and testing V_{OH}/V_{OL}.
