

MC10198

Monostable Multivibrator

The MC10198 is a retriggerable monostable multivibrator. Two enable inputs permit triggering on any combination of positive or negative edges as shown in the accompanying table. The trigger input is buffered by Schmitt triggers making it insensitive to input rise and fall times.

The pulse width is controlled by an external capacitor and resistor. The resistor sets a current which is the linear discharge rate of the capacitor. Also, the pulse width can be controlled by an external current source or voltage (see applications information).

For high-speed response with minimum delay, a hi-speed input is also provided. This input bypasses the internal Schmitt triggers and the output responds within 2 nanoseconds typically.

Output logic and threshold levels are standard MECL 10,000. Test conditions are per Table 2. Each "Precondition" referred to in Table 2 is per the sequence of Table 1.

- $P_D = 415 \text{ mW typ/pkg (No Load)}$
- $t_{pd} = 4.0 \text{ ns typ Trigger Input to Q}$
- $2.0 \text{ ns typ Hi-Speed Input to Q}$
- Min Timing Pulse Width PW_{Qmin} 10 ns typ^1
- Max Timing Pulse Width PW_{Qmax} $>10 \text{ ms typ}^2$
- Min Trigger Pulse Width PW_T 2.0 ns typ
- Min Hi-Speed Trigger Pulse Width PW_{HS} 3.0 ns typ
- Enable Setup Time t_{set} 1.0 ns typ
- Enable Hold Time t_{hold} 1.0 ns typ
- $^1 C_{Ext} = 0$ (Pin 4 open), $R_{Ext} = 0$ (Pin 6 to V_{EE})
- $^2 C_{Ext} = 10 \text{ mF}$, $R_{Ext} = 2.7 \text{ kW}$

H	H	Trigger is disabled

TABLE 1 — PRECONDITION SEQUENCE

- At $t = 0$
 - Apply V_{IHmax} to Pin 5 and 10.
 - Apply V_{ILmin} to Pin 15.
 - Ground Pin 4.
- At $t \geq 10$ ns
 - Open Pin 1.
 - Apply -3.0 Vdc to Pin 4. Hold these conditions for ≥ 10 ns.
- Return Pin 4 to Ground and perform test as indicated in Table 2.

TABLE 2 — CONDITIONS FOR TESTING OUTPUT LEVELS

(See Table 1 for Precondition Sequence)

Pins 1, 16 = V_{CC} = Ground
 Pins 6, 8 = V_{EE} = -5.2 Vdc
 Outputs loaded 50Ω to -2.0 Vdc

- The monostable is in the timing mode at the time of this test.
- C_{EXT} = 0 (Pin 4 Open); R_{EXT} = 0 (Pin 6 tied to V_{EE}).
- C_{EXT} = 10μF (Pin); R_{EXT} = 2.7k (Pin 6).

Each MECL 10,000 series circuit has been designed to meet the dc specifications shown in the test table, after thermal equilibrium has been established. The circuit is in a test socket or mounted on a printed circuit board and transverse air flow greater than 500 linear fpm is maintained. Outputs are terminated through a 50-ohm resistor to -2.0 volts. Test procedures are shown for only one gate. The other gates are tested in the same manner.

MC10198

SWITCHING TIME TEST CIRCUIT AND WAVEFORMS @ 25°C

APPLICATIONS INFORMATION

Circuit Operation:

1. PULSE WIDTH TIMING — The pulse width is determined by the external resistor and capacitor. The MC10198 also has an internal resistor (nominally 284 ohms) that can be used in series with R_{Ext}. Pin 7, the external pulse width control, is a constant voltage node (-3.60 V nominally). A resistance connected in series from this node to V_{EE} sets a constant timing current I_T. This current determines the discharge rate of the capacitor:

where

$$\Delta T = \text{pulse width}$$

$$\Delta V = 1.9 \text{ V change in capacitor voltage}$$

$$\text{Then: } I_T = C_{Ext} \frac{\Delta V}{\Delta T}$$

If R_{Ext} + R_{Int} are in series to V_{EE}:

$$I_T = [(-3.60 \text{ V}) - (-5.2 \text{ V})] \div [R_{Ext} + 284 \Omega]$$

$$I_T = 1.6 \text{ V} / (R_{Ext} + 284)$$

$$\text{The timing equation becomes: } \Delta T = C_{Ext} \frac{1.9 \text{ V}}{I_T}$$

$$\Delta T = [(C_{Ext})(1.9 \text{ V})] \div [1.6 \text{ V} / (R_{Ext} + 284)]$$

$$\Delta T = C_{Ext} (R_{Ext} + 284) 1.19$$

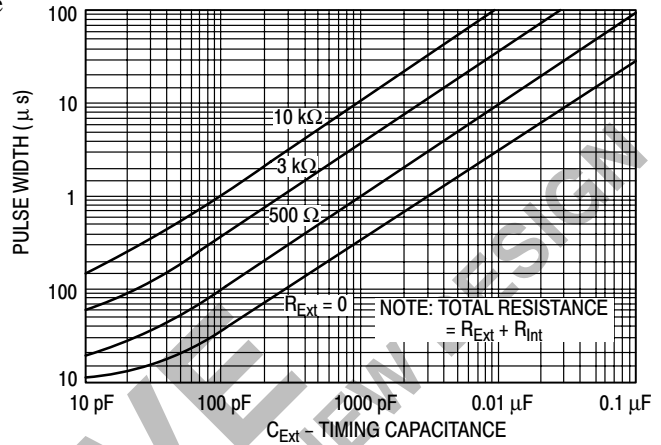

where $\Delta T = \text{Sec}$

$$R_{Ext} = \text{Ohms}$$

$$C_{Ext} = \text{Farads}$$

Figure 2 shows typical curves for pulse width versus C_{Ext} and R_{Ext} (total resistance includes R_{Int}). Any low leakage capacitor can be used and R_{Ext} can vary from 0 to 16 k-ohms.

FIGURE 2 – TIMING PULSE WIDTH versus C_{Ext} and R_{Ext}

2. TRIGGERING — The \bar{E}_{pos} and \bar{E}_{neg} inputs control the trigger input. The MC10198 can be programmed to trigger on the positive edge, negative edge, or both. Also, the trigger input can be totally disabled. The truth table is shown on the first page of the data sheet.

The device is totally retriggerable. However, as duty cycle approaches 100%, pulse width jitter can occur due to the recovery time of the circuit. Recovery time is basically dependent on capacitance C_{Ext}. Figure 3 shows typical recovery time versus capacitance at I_T = 5 mA.

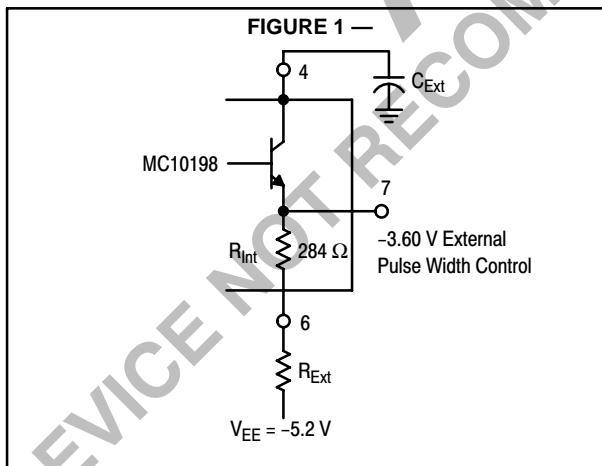

FIGURE 3 — RECOVERY TIME versus C_{Ext} @ I_T = 5 mA

MC10198

3. **HI-SPEED INPUT** — This input is used for stretching very narrow pulses with minimum delay between the output pulse and the trigger pulse. The trigger input should be disabled when using the high-speed input. The MC10198 triggers on the rising edge, using this input, and input pulse width should narrow, typically less than 10 nanoseconds.

USAGE RULES:

1. Capacitor lead lengths should be kept very short to minimize ringing due to fast recovery rise times.
2. The \bar{E} inputs should not be tied to ground to establish a high logic level. A resistor divider or diode can be used to establish a -0.7 to -0.9 voltage level.
3. For optimum temperature stability; 0.5 mA is the best timing current I_T . The device is designed to have a constant voltage at the EXTERNAL PULSE WIDTH CONTROL over temperature at this current value.
4. Pulse Width modulation can be attained with the EXTERNAL PULSE WIDTH CONTROL. The timing current can be altered to vary the pulse width. Two schemes are:
 - a. The internal resistor is not used. A dependent current source is used to set the timing current as shown in Figure 4. A graph of pulse width versus timing current ($C_{Ext} = 13$ pF) is shown in Figure 5.
 - b. A control voltage can also be used to vary the pulse width using an additional resistor (Figure 6). The current ($I_T + I_C$) is set by the voltage drop across $R_{Int} + R_{Ext}$. The control current I_C modifies I_T and alters the pulse width. Current I_C should never force I_T to zero. R_C typically 1 k Ω .

FIGURE 4 —

FIGURE 5 — PULSE WIDTH versus I_T @ $C_{Ext} = 13$ pF

FIGURE 6 —

MC10198

5. The MC10198 can be made non-retriggerable. The Q output is fed back to disable the trigger input during the triggered state (Logic Diagram). Figure 7 shows a positive triggered configuration; a similar configuration can be made for negative triggering.
