DUAL RETRIGGERABLE MONOSTABLE MULTIVIBRATOR
General Description

The MM54HC123A high speed monostable multivibrators (one shots) utilize advanced silicon-gate CMOS technology. They feature speeds comparable to low power Schottky TTL circuitry while retaining the low power and high noise immunity characteristic of CMOS circuits.

Each multivibrator features both a negative, A, and a positive, B, transition triggered input, either of which can be used as an inhibit input. Also included is a clear input that when taken low resets the one shot. The 'HC123' can be triggered on the positive transition of the clear while A is held low and B is held high.

The 'HC123A is retriggerable. That is it may be triggered repeatedly while their outputs are generating a pulse and the pulse will be extended.

Pulse width stability over a wide range of temperature and supply is achieved using linear CMOS techniques. The output pulse equation is simple: $Pw = (Rext) (Cext)$; where Pw is in seconds, R is in Ohms, and C is in farads. All inputs are protected from damage due to static discharge by diodes to Vcc and ground.
