

2K x 8 Reprogrammable PROM

Features

- Windowed for reprogrammability
- CMOS for optimum speed/power
- High speed
 - 20 ns (Commercial)
 - 35 ns (Military)
- Low power
 - 660 mW (Commercial and Military)
- Low standby power
 - 220 mW (Commercial and Military)
- EPROM technology 100% programmable
- Slim 300-mil or standard 600-mil packaging available
- 5V $\pm 10\%$ V_{CC} , commercial and military
- TTL-compatible I/O
- Direct replacement for bipolar PROMs
- Capable of withstanding >2001V static discharge

Functional Description

The CY7C291A is a high-performance 2K-word by 8-bit CMOS PROM. It is packaged in a 300-mil ceramic package which may be equipped with an erasure window; when exposed to UV light the PROM is erased and can then be reprogrammed. The memory cells utilize proven EPROM floating-gate technology and byte-wide intelligent programming algorithms.

The CY7C291A is a plug-in replacement for bipolar devices and offers the advantage of lower power, reprogrammability, superior performance and programming yield. The EPROM cell requires only 12.5V for the supervoltage and low current requirements allow for gang programming. The EPROM cells allow for each memory location to be tested 100%, as each location is written into, erased, and repeatedly exercised prior to encapsulation. Each PROM is also tested for AC performance to guarantee that after customer programming the product will meet DC and AC specification limits.

A read is accomplished by placing an active LOW signal on CS_1 , and active HIGH signals on CS_2 and CS_3 . The contents of the memory location addressed by the address line (A_0 – A_{10}) will become available on the output lines (O_0 – O_7).

Maximum Ratings

(Above which the useful life may be impaired. For user guidelines, not tested.)

- Storage Temperature -65°C to +150°C
- Ambient Temperature with Power Applied..... -55°C to +125°C
- Supply Voltage to Ground Potential -0.5V to +7.0V
- DC Voltage Applied to Outputs in High Z State -0.5V to +7.0V
- DC Input Voltage -3.0V to +7.0V

- DC Program Voltage..... 13.0V
- UV Exposure 7258 Wsec/cm²
- Static Discharge Voltage..... >2001V (per MIL-STD-883, Method 3015)
- Latch-Up Current..... >200 mA

Notes

- See the last page of this specification for Group A subgroup testing information.
- See the "Introduction to CMOS PROMs" section of the Cypress Data Book for general information on testing.
- For test purposes, not more than one output at a time should be shorted. Short circuit test duration should not exceed 30 seconds.

Erase Characteristics

Wavelengths of light less than 4000 Angstroms begin to erase these PROMs. For this reason, an opaque label should be placed over the window if the PROM is exposed to sunlight or fluorescent lighting for extended periods of time.

The recommended dose of ultraviolet light for erasure is a wavelength of 2537 Angstroms for a minimum dose (UV intensity x exposure time) of 25 Wsec/cm². For an ultraviolet lamp with a 12 mW/cm² power rating, the exposure time would be approximately 35 minutes.

These PROMs need to be within 1 inch of the lamp during erasure. Permanent damage may result if the PROM is exposed to high-intensity UV light for an extended period of time. 7258 Wsec/cm² is the recommended maximum dosage.

Programming Information

Programming support is available from Cypress as well as from a number of third-party software vendors. For detailed programming information, including a listing of software packages, please see the PROM Programming Information located at the end of this section. Programming algorithms can be obtained from any Cypress representative.
