* Reverse power dissipation and the possibility of thermal runaway must be considered when operating this device under any reverse voltage conditions. Calculations of $T_{J}$ therefore must include forward and reverse power effects. The allowable operating $T_{J}$ may be calculated from the equation: $\quad T_{J}=T_{J m a x}-r(t)(P f+P r)$ where
$r(t)=$ thermal impedance under given conditions,
$\mathrm{Pf}=$ forward power dissipation, and
$\mathrm{Pr}=$ reverse power dissipation
This graph displays the derated allowable $T_{J}$ due to reverse bias under $D C$ conditions only and is calculated as $T_{J}=T_{J m a x}-r(t) P r$,
