# for EU RoHS Compliant

- $\cdot$  All the products in this catalog comply with EU RoHS.
- EU RoHS is "the European Directive 2002/95/EC on the Restriction of the Use of Certain Hazardous Substances in Electrical and Electronic Equipment".
- For more details, please refer to our website 'Murata's Approach for EU RoHS' (http://www.murata.com/info/rohs.html).

\*1 Please refer to table for Capacitance Change under reference temperature.

\*2 Capacitance change is specified with 50% rated voltage applied.

\*3 Murata Temperature Characteristic Code.

\*4 Apply DC350V bias.

\*5 No DC bias.

\*6 Rated Voltage 100Vdc max : 25 to 85°C

#### Capacitance

Expressed by three-digit alphanumerics. The unit is pico-farad (pF). The first and second figures are significant digits, and the third figure expresses the number of zeros which follow the two numbers. If there is a decimal point, it is expressed by the capital letter "**R**". In this case, all figures are significant digits.

| Ex.) | Code | Capacitance |
|------|------|-------------|
|      | R50  | 0.5pF       |
|      | 1R0  | 1.0pF       |
|      | 100  | 10pF        |
|      | 103  | 10000pF     |

#### **Selection Guide of Chip Monolithic Ceramic Capacitors**

# 1

# **Chip Monolithic Ceramic Capacitors**

# for General Purpose GRM Series

- Features
- Higher resistance of solder-leaching due to the Ni-barriered termination, applicable for reflow-soldering, and flow-soldering (GRM18/21/31 type only).
- 2. The GRM series is lead free product.
- 3. Smaller size and higher capacitance value.
- 4. High reliability and no polarity.
- 5. Excellent pulse responsibility and noise reduction due to the low impedance at high frequency.
- The GRM series is available in paper or embossed tape and reel packaging for automatic placement. Bulk case packaging is also available for GRM15/ 18/21(T=0.6,1.25).
- 7. Ta replacement.

Applications

General electronic equipment

| Part Number |           | Din       | nensions         | (mm)         |        |       |

Please check with our sales representatives or product engineers before ordering. • This PDF catalog has only typical specifications because there is no space for detailed specifications. Therefore, please approve our product specifications or transact the approval sheet for product specifications before ordering. C02E.pdf 09.9.18

# **Chip Monolithic Ceramic Capacitors**

## **Capacitor Array GNM Series**

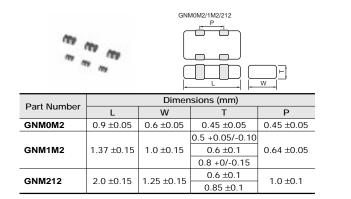

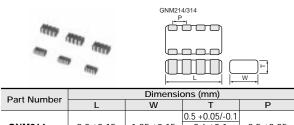

### Features

- 1. High density mounting due to mounting space saving
- 2. Mounting cost saving

### Applications

General electronic equipment

# **Chip Monolithic Ceramic Capacitors**

### Low ESL LLL/LLA/LLM Series

#### **Reversed Geometry Low ESL Type**

#### Features

- 1. Low ESL, good for noise reduction for high frequency
- 2. Small, high cap

#### Applications

- 1. High speed micro processor
- 2. High frequency digital equipment

# **Chip Monolithic Ceramic Capacitors**

# muRata

### **High Frequency GQM Series**

#### Features

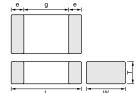

- 1. HiQ and low ESR at VHF, UHF, Microwave
- 2. Feature improvement, low power consumption for mobile telecommunication. (Base station, terminal, etc.)

#### Applications

5

High frequency circuit (Mobile telecommunication, etc.)

g

# High Frequency Type ERB Series

- Features (ERB Series)
- 1. Negligible inductance is achieved by its monolithic structure so the series can be used at frequencies above 1GHz.
- 2. Nickel barriered terminations of ERB series improve solderability and decrease solder leaching.
- 3. ERB18/21 series are designed for both flow and reflow soldering and ERB32 series are designed for reflow soldering.

#### Applications

High frequency and high-power circuits

| Part Number   |         | Dimen    | isions (mm) |        |        |
|---------------|---------|----------|-------------|--------|--------|
| Part Nulliber | L       | W        | T max.      | e min. | g min. |
| ERB188        | 1.6±0.1 | 0.8±0.1  | 0.9         | 0.2    | 0.5    |
| ERB21B        | 2.0±0.3 | 1.25±0.3 | 1.35        | 0.25   | 0.7    |
| ERB32Q        | 3.2±0.3 | 2.5±0.3  | 1.7         | 0.3    | 1.0    |

### Capacitance Table

# **Chip Monolithic Ceramic Capacitors**

# muRata

# **Monolithic Microchip GMA Series**

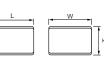

#### Features

- 1. Better micro wave characteristics
- 2. Suitable for by-passing
- 3. High density mounting

#### Applications

- 1. Optical device for telecommunication
- 2. IC, IC packaging built-in
- 3. Measuring equipment

Outer electrode: Au plated

# GMA Series Specifications and Test Methods(1)

In case Non "\*" is added in PNs table, please refer to GMA Series Specifications and Test Methods (1). In case "\*" is added in PNs table, please refer to GMA Series Specifications and Test Methods (2).

| 1  |   | Item Specifications    |   |   |
|----|---|------------------------|---|---|
|    | Operating       Temperature       Range   R7: -55 to +125°C |                        | R7: −55 to +125℃  | Reference Temperature: 25°C   |
| 2  | Rated Voltage   |                        | See the previous pages.   | The rated voltage is defined as the maximum voltage which<br>may be applied continuously to the capacitor.<br>When AC voltage is superimposed on DC voltage, $V^{p,p}$ or $V^{o,p}$ ,<br>whichever is larger, should be maintained within the rated voltage<br>range.   |
| 3  | Appearan  | nce                    | No defects or abnormalities   | Visual inspection   |
| 4  | Dimensio  | ns                     | Within the specified dimensions                                     | Using calipers  |
| 5  | Dielectric  | Strength               | No defects or abnormalities   | No failure should be observed when a voltage of 250% of the rated voltage is applied between the both terminations for 1 to 5 seconds, provided the charge/discharge current is less than 50mA.   |
| 6  | Insulation  | Resistance             | More than 10,000M $\Omega$ or 500 $\Omega$ F (Whichever is smaller) | The insulation resistance should be measured with a DC voltage not exceeding the rated voltage at normal temperature and humidity and within 2 minutes of charging.   |
| 7  | Capacitar   | nce                    | Within the specified tolerance                                      | The capacitance/D.F. should be measured at reference  |
| 8  | Dissipatio<br>(D.F.)  | n Factor               | R7: W.V.: 25V min.; 0.025 max.<br>W.V.: 16V/10V; 0.035 max.         | temperature at the frequency and voltage shown in the table.           Frequency         1±0.1kHz           Voltage         1±0.2Vrms   |
| 9  | Capacitance<br>Temperature<br>Characteristics               | No bias                | R7: Within +/–15% (–55 to +125°C)                                   | The capacitance change should be measured after 5min. at each specified temp. stage.<br>• The ranges of capacitance change compared with the Reference Temperature value over the temperature ranges shown in the table should be within the specified ranges.*<br>$ \hline Step \qquad Temperature (°C) \\ 1 \qquad 25\pm2 \\ 2 \qquad -55\pm3 \\ 3 \qquad 25\pm2 \\ 4 \qquad 125\pm3 \\ $ *Initial measurement for high dielectric constant type Perform a heat treatment at 150 +0/-10°C for one hour and then let sit for 24±2 hours at room temperature.<br>Perform the initial measurement. |
| 10 | Mechanical  | Bond<br>Strength       | Pull force: 0.03N min.  | MIL-STD-883 Method 2011 Condition D<br>Mount the capacitor on a gold metallized alumina substrate with<br>Au-Sn (80/20) and bond a $25\mu$ m (0.001 inch) gold wire to the<br>capacitor terminal using an ultrasonic ball bond. Then, pull wire.  |
|    | Strength  | Die Shear<br>Strength  | Die Shear force: 2N min.  | MIL-STD-883 Method 2019<br>Mount the capacitor on a gold metallized alumina substrate<br>with Au-Sn (80/20). Apply the force parallel to the substrate.   |
|    |   | Appearance             | No defects or abnormalities   | Ramp frequency from 10 to 55Hz then return to 10Hz all within   |
| 11 | Vibration   | Capacitance            | Within the specified tolerance                                      | 1 minute. Amplitude: 1.5 mm (0.06 inch) max. total excursion.   |
|    | Resistance  | D.F.                   | R7: W.V.: 25V min.; 0.025 max.<br>W.V.: 16V/10V; 0.035 max.         | Apply this motion for a period of 2 hours in each of 3 mutually perpendicular directions (total 6 hours).   |
|    |   | Appearance             | No defects or abnormalities   | The capacitor should be set for 24±2 hours at room  |
|    |   | Capacitance<br>Change  | R7: Within ±7.5%  | temperature after one hour heat of treatment at $150+0/-10^{\circ}$ , then measure for the initial measurement. Fix the capacitor to  |
| 10 | Temperature   | D.F.                   | R7: W.V.: 25V min.; 0.025 max.<br>W.V.: 16V/10V; 0.035 max.         | the supporting jig in the same manner and under the same<br>conditions as (11) and conduct the five cycles according to the<br>temperatures and time shown in the following table. Set it for   |
| 12 | Cycle   | I.R.                   | More than 10,000M $\Omega$ or 500 $\Omega$ F                        | $24\pm2$ hours at room temperature, then measure.   |
|    |   | Dielectric<br>Strength | (Whichever is smaller)<br>No defects                                | Step         1         2         3         4           Temp. (°C)         Min. Operating<br>Temp. +0/-3         Room<br>Temp.         Max. Operating<br>Temp. +3/-0         Room<br>Temp.           Time (min.)         30±3         2 to 3         30±3         2 to 3   |

Mounting for testing: The capacitors should be mounted on the substrate as shown below using die bonding and wire bonding when tests No.11 to 15 are performed.

| No. | Ite   | m                     | Specifications                        | Test Method  |
|     |   | Appearance            | No defects or abnormalities.          | Apply the rated voltage for 500±12 hours at 40±2°C, in 90 to   |
|     |   | Capacitance<br>Change | R6 : Within ±12.5%                    | 95% humidity and set it for 24±2 hours at room temperature,<br>then measure. The charge/discharge current is less than<br>50mA.  |
|     | High  | D.F.                  | R6 : 0.2 max.                         |  |
| 13  | Temperature<br>High<br>Humidity<br>(Steady) | I.R.                  | More than 12.5Ω · F                   | <ul> <li>Initial measurement         Perform a heat treatment at 150+0/-10°C for one hour and then             let sit for 24±2 hours at room temperature. Perform the initial             measurement.         </li> <li>Measurement after test         Perform a heat treatment at 150+0/-10°C for one hour and then             let sit for 24±2 hours at room temperature, then measure.     </li> </ul> |
|     |   | Appearance            | No defects or abnormalities.          | Apply 150% of the rated voltage for 1000±12 hours at the   |
|     |   | Capacitance<br>Change | R6 : Within ±12.5%                    | maximum operating temperature ±3°C. Let sit for 24±2 hours at room temperature, then measure.<br>The charge/ discharge current is less than 50mA.  |
|     |   | D.F.                  | R6 : 0.2 max.                         |  |
| 14  | Durability                                  | I.R.                  | More than $25\Omega \cdot F$          | <ul> <li>Initial measurement         Perform a heat treatment at 150+0/–10°C for one hour and then             let sit for 24±2 hours at room temperature. Perform the initial             measurement.         </li> <li>Measurement after test         Perform a heat treatment at 150+0/–10°C for one hour and then             let sit for 24±2 hours at room temperature, then measure.     </li> </ul> |

Mounting for testing : The capacitors should be mounted on the substrate as shown below using die bonding and wire bonding when tests No.11 to 14 are performed.

# **Chip Monolithic Ceramic Capacitors**

# muRata

# for Bonding GMD Series

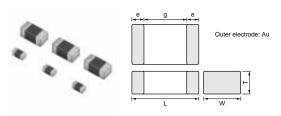

# Series

#### Features

- 1. Small chip size (LxWxT: 0.6x0.3x0.3, 1.0x0.5x0.5mm)
- 2. Available for Wire/Die bonding due to Gold termination.
- 3. Suitable for Optical device for telecommunication, IC packaging built-in.

#### Applications

- 1. Optical device for telecommunication
- 2. IC, IC packaging built-in

# GMD Series Specifications and Test Methods (1)

In case Non "\*" is added in PNs table, please refer to GMD Series Specifications and Test Methods (1).

| No. | Ite   | em                          | Specifications  | Test Method  |
|-----|---|-----------------------------|---|--|
| 1   | Operating<br>Temperature<br>Range                                       |                             | R7 :55°C to 125°C   | Reference Temperature : 25°C   |
| 2   | Rated Voltage   |                             | See the previous pages.   | The rated voltage is defined as the maximum voltage which<br>may be applied continuously to the capacitor.<br>When AC voltage is superimposed on DC voltage, V <sup>p.p</sup> or V <sup>o.p</sup> ,<br>whichever is larger, should be maintained within the rated volt-<br>age range.  |
| 3   | Appearan  | ice                         | No defects or abnormalities.  | Visual inspection.   |
| 4   | Dimensio  | ns                          | Within the specified dimensions.  | Using calipers.  |
| 5   | Dielectric  | Strength                    | No defects or abnormality.  | No failure should be observed when 250% of the rated voltage<br>is applied between the terminations for 1 to 5 seconds, provid-<br>ed the charge/discharge current is less than 50mA.  |
| 6   | Insulation<br>Resistanc   |                             | More than 10,000M $\Omega$ or 500 $\Omega$ $\cdot$ F (Whichever is smaller) | The insulation resistance should be measured with a DC voltage not exceeding the rated voltage at normal temperature and humidity and within 2 minutes of charging.  |
| 7   | Capacitar   | nce                         | Within the specified tolerance.   | The capacitance/D.F. should be measured at reference   |
| 8   | Dissipatio<br>Factor (D   |                             | R7 :<br>W.V. 25Vmin. : 0.025 max.<br>W.V. 16/10V : 0.035 max.               | temperature at the frequency and voltage shown in the table.           Frequency         1±0.1kHz           Voltage         1±0.2Vrms  |
| 9   | Capacitance<br>Temperature<br>Characteristics<br>Mechanical<br>Strength | No bias<br>Bond<br>Strength | R7 : Within ±15% (–55°C to +125°C)<br>Pull force : 0.03N min.               | The capacitance change should be measured after 5min. at each specified temp. stage.         The ranges of capacitance change compared with the Reference Temperature value over the temperature ranges shown in the table should be within the specified ranges.*         Step       Temperature (°C)         1       25±2         2       -55±3         3       25±2         4       125±3         *Initial measurement for high dielectric constant type Perform a heat treatment at 150 +0/-10°C for one hour and then let sit for 24±2 hours at room temperature. Perform the initial measurement.         MIL-STD-883 Method 2011 Condition D Mount the capacitor on a gold metallized alumina substrate wit Au-Sn (80/20) and bond a 25mm (0.001 inch) gold wire to the capacitor terminal using an ultrasonic ball bond. Then, pull wire MIL-STD-883 Method 2019   |
|     |   | Die Shear<br>Strength       | Die Shear force : 2N min.   | Mount the capacitor on a gold metallized alumina substrate with Au-Sn (80/20). Apply the force parallel to the substrate.  |
|     |   | Appearance                  | No defects or abnormalities.  | Ramp frequency from 10 to 55Hz then return to 10Hz all within  |
| 11  | Vibration   | Capacitance                 | Within the specified tolerance.   | 1 minute. Amplitude : 1.5 mm (0.06 inch) max. total excursion.   |
| . 1 | Resistance  | D.F.                        | R7 :<br>W.V. 25Vmin. : 0.025 max.<br>W.V. 16/10V : 0.035 max.               | Apply this motion for a period of 2 hours in each of 3 mutually perpendicular directions (total 6 hours).  |
|     |   | Appearance                  | No defects or abnormalities.  | The capacitor should be set for 24±2 hours at room   |
|     |   | Capacitance<br>Change       | R7 : Within ±7.5%   | temperature after one hour heat of treatment at 150+0/–10°C,<br>then measure for the initial measurement. Fix the capacitor to<br>the supporting jig in the same manner and under the same   |
| 12  | Temperature<br>Cycle  | D.F.                        | R7:<br>W.V. 25Vmin.:0.025 max.<br>W.V. 16/10V:0.035 max.                    | conditions as (11) and conduct the five cycles according to the temperatures and time shown in the following table. Set it for 24±2 hours at room temperature, then measure.   |
|     |   | I.R.                        | More than $10,000M\Omega$ or $500\Omega \cdot F$                            | Step         1         2         3         4           Min         Max         Max |
|     | -   |                             | (Whichever is smaller)  | Min. Room Max. Room Temp. (°C) Operating T   |

Mounting for testing : The capacitors should be mounted on the substrate as shown below using die bonding. when tests No.11 to 15 are performed.

#### (3) Dimensions of Embossed Tape

- (4) Taping Method
  - 1) Tapes for capacitors are wound clockwise. The sprocket holes are to the right as the tape is pulled toward the user.
  - 2 Part of the leader and part of the empty tape should be attached to the end of the tape as follows.
  - ③ The top tape and base tape are not attached at the end of the tape for a minimum of 5 pitches.
  - (4) Missing capacitors number within 0.1% of the number per reel or 1 pc, whichever is greater, and are not continuous.
  - (5) The top tape and bottom tape should not protrude beyond the edges of the tape and should not cover sprocket holes.
  - (6) Cumulative tolerance of sprocket holes, 10 pitches: ±0.3mm.
  - ⑦ Peeling off force: 0.1 to 0.6N\* in the direction shown below. GRM02

#### **Caution**

- Storage and Operation condition
- 1. The performance of chip monolithic ceramic capacitors may be affected by the storage conditions.
  - 1-1. Store capacitors in the following conditions: Temperature of +5°C to +40°C and a Relative Humidity of 20% to 70%.
    - Sunlight, dust, rapid temperature changes, corrosive gas atmosphere or high temperature and humidity conditions during storage may affect the solderability and the packaging performance. Please use product within six months of receipt.
    - (2) Please confirm solderability before using after six months. Store the capacitors without opening the original bag. Even if the storage period is short, do not exceed the specified atmospheric conditions.
- 1-2. Corrosive gas can react with the termination (external) electrodes or lead wires of capacitors, and result in poor solderability. Do not store the capacitors in an atmosphere consisting of corrosive gas (e.g., hydrogen sulfide, sulfur dioxide, chlorine, ammonia gas, etc.).
- 1-3. Due to moisture condensation caused by rapid humidity changes, or the photochemical change caused by direct sunlight on the terminal electrodes and/or the resin/epoxy coatings, the solderability and electrical performance may deteriorate. Do not store capacitors under direct sunlight or in high humidity conditions.

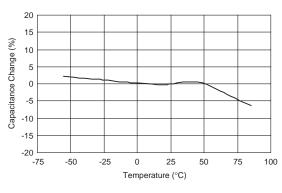

#### 

#### Rating

- 1. Temperature Dependent Characteristics
- 1. The electrical characteristics of the capacitor can change with temperature.
  - 1-1. For capacitors having larger temperature dependency, the capacitance may change with temperature changes.

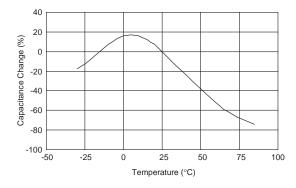

The following actions are recommended in order to insure suitable capacitance values.

(1) Select a suitable capacitance for the operating temperature range.

Typical Temperature Characteristics Char. R6(X5R)

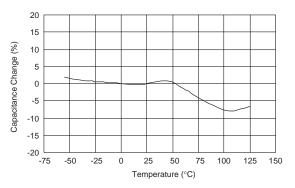

Typical Temperature Characteristics Char. F5(Y5V)

- 2. Measurement of Capacitance
- 1. Measure capacitance with the voltage and the frequency specified in the product specifications.
  - 1-1. The output voltage of the measuring equipment may decrease when capacitance is high occasionally.
     Please confirm whether a prescribed measured voltage is impressed to the capacitor.
  - 1-2. The capacitance values of high dielectric constant type capacitors change depending on the AC voltage applied. Please consider the AC voltage characteristics when selecting a capacitor to be used in a AC circuit.

- (2) The capacitance may change within the rated temperature.
  - When you use a high dielectric constant type capacitors in a circuit that needs a tight (narrow) capacitance tolerance. Example: a time constant circuit., please carefully consider the characteristics of these capacitors, such as their aging, voltage, and temperature characteristics. And check capacitors using your actual appliances at the intended environment and operating conditions.

Typical Temperature Characteristics Char. R7(X7R)

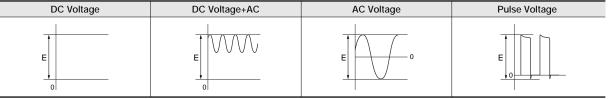

#### 

Continued from the preceding page.

- 3. Applied Voltage
- 1. Do not apply a voltage to the capacitor that exceeds the rated voltage as called-out in the specifications.
  - 1-1. Applied voltage between the terminals of a capacitor shall be less than or equal to the rated voltage.
    - When AC voltage is superimposed on DC voltage, the zero-to-peak voltage shall not exceed the rated DC voltage.

When AC voltage or pulse voltage is applied, the peak-to-peak voltage shall not exceed the rated DC voltage.

(2) Abnormal voltages (surge voltage, static electricity, pulse voltage, etc.) shall not exceed the rated DC voltage.

(E: Maximum possible applied voltage.)

1-2. Influence of overvoltage

Overvoltage that is applied to the capacitor may result in an electrical short circuit caused by the breakdown of the internal dielectric layers . The time duration until breakdown depends on the applied voltage and the ambient temperature.

- 4. Applied Voltage and Self-heating Temperature
- 1. When the capacitor is used in a high-frequency voltage, pulse voltage, application, be sure to take into account self-heating may be caused by resistant factors of the capacitor.
  - 1-1. The load should be contained to the level such that when measuring at atomospheric temperature of 25°C, the product's self-heating remains below 20°C and surface temperature of the capacitor in the actual circuit remains wiyhin the maximum operating temperature.

Continued on the following page.

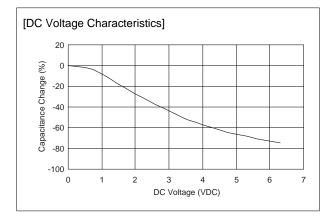

Continued from the preceding page.

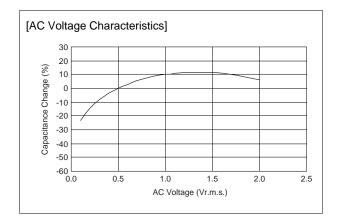

- 5. DC Voltage and AC Voltage Characteristic
- The capacitance value of a high dielectric constant type capacitor changes depending on the DC voltage applied. Please consider the DC voltage characteristics when a capacitor is selected for use in a DC circuit.
  - 1-1. The capacitance of ceramic capacitors may change sharply depending on the applied voltage. (See figure)

Please confirm the following in order to secure the capacitance.

- Whether the capacitance change caused by the applied voltage is within the range allowed or not.
- (2) In the DC voltage characteristics, the rate of capacitance change becomes larger as voltage increases. Even if the applied voltage is below the rated voltage. When a high dielectric constant type capacitor is in a circuit that needs a tight (narrow) capacitance tolerance. Example: a time constant circuit., please carefully consider the characteristics of these capacitors, such as their aging, voltage, and temperature characteristics. And check capacitors using your actual appliances at the intended environment and operating conditions.
- 2. The capacitance values of high dielectric constant type capacitors change depending on the AC voltage applied.

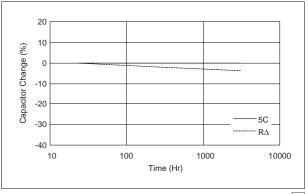

Please consider the AC voltage characteristics when selecting a capacitor to be used in a AC circuit.

- 6. Capacitance Aging
- 1. The high dielectric constant type capacitors have the characteristic in which the capacitance value decreases with passage of time.

When you use a high dielectric constant type capacitors in a circuit that needs a tight (narrow) capacitance tolerance. Example: a time constant circuit., please carefully consider the characteristics of these capacitors, such as their aging, voltage, and temperature characteristics. And check capacitors using your actual appliances at the intended environment and operating conditions.

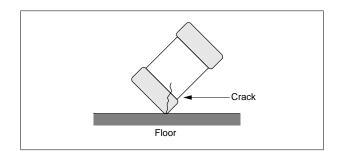

Continued on the following page.

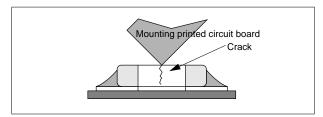

Downloaded from Elcodis.com electronic components distributor

Continued from the preceding page.

- 7. Vibration and Shock
- The capacitors mechanical actress (vibration and shock) shall be specified for the use environment. Please confirm the kind of vibration and/or shock, its condition, and any generation of resonance. Please mount the capacitor so as not to generate resonance, and do not allow any impact on the terminals.
- Mechanical shock due to falling may cause damage or a crack in the dielectric material of the capacitor.
   Do not use a fallen capacitor because the quality and reliability may be deteriorated.
- 3. When printed circuit boards are piled up or handled, the corners of another printed circuit board should not be allowed to hit the capacitor in order to avoid a crack or other damage to the capacitor.

#### Soldering and Mounting

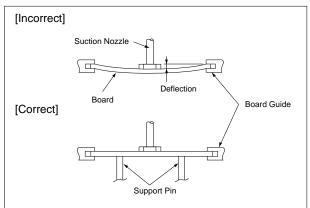

- 1. Mounting Position
- Confirm the best mounting position and direction that minimizes the stress imposed on the capacitor during flexing or bending the printed circuit board.
  - 1-1. Choose a mounting position that minimizes the stress imposed on the chip during flexing or bending of the board.

[Component Direction] Locate chip horizontal to the direction in which stress acts. [Chip Mounting Close to Board Separation Point] C Chip arrangement Perforation в Worst A-C-(B~D) Best 000 А Slit

- 2. Information before Mounting
- 1. Do not re-use capacitors that were removed from the equipment.
- 2. Confirm capacitance characteristics under actual applied voltage.
- 3. Confirm the mechanical stress under actual process and equipment use.
- 4. Confirm the rated capacitance, rated voltage and other electrical characteristics before assembly.
- 5. Prior to use, confirm the Solderability for the capacitors that were in long-term storage.
- 6. Prior to measuring capacitance, carry out a heat treatment for capacitors that were in long-term storage.
- The use of Sn-Zn based solder will deteriorate the reliability of the MLCC.
   Please contact our sales representative or product engineers on the use of Sn-Zn based solder in advance.

#### 3. Maintenance of the Mounting (pick and place) Machine

- 1. Make sure that the following excessive forces are not applied to the capacitors.
  - 1-1. In mounting the capacitors on the printed circuit board, any bending force against them shall be kept to a minimum to prevent them from any bending damage or cracking. Please take into account the following precautions and recommendations for use in your process.
    - (1) Adjust the lowest position of the pickup nozzle so as not to bend the printed circuit board.
    - (2) Adjust the nozzle pressure within a static load of 1N to 3N during mounting.
- 2. Dirt particles and dust accumulated between the suction nozzle and the cylinder inner wall prevent the nozzle from moving smoothly. This imposes greater force upon the chip during mounting, causing cracked chips. Also the locating claw, when worn out, imposes uneven forces on the chip when positioning, causing cracked chips. The suction nozzle and the locating claw must be maintained, checked and replaced periodically.

Continued from the preceding page.

- 4-1. Reflow Soldering
- 1. When sudden heat is applied to the components, the mechanical strength of the components will decrease because a sudden temperature change causes deformation inside the components. In order to prevent mechanical damage to the components, preheating is required for both the components and the PCB board. Preheating conditions are shown in table 1. It is required to keep the temperature differential between the solder and the components surface ( $\Delta$ T) as small as possible.
- Solderability of Tin plating termination chips might be deteriorated when a low temperature soldering profile where the peak solder temperature is below the melting point of Tin is used. Please confirm the Solderability of Tin plated termination chips before use.
- 3. When components are immersed in solvent after mounting, be sure to maintain the temperature difference ( $\Delta$ T) between the component and the solvent within the range shown in the table 1.

| Table 1              |                          |
|----------------------|--------------------------|
| Part Number          | Temperature Differential |
| GRM02/03/15/18/21/31 |                          |
| GJM03/15             |                          |
| LLL15/18/21/31       | ∆T≦190°C                 |
| ERB18/21             |                          |
| GQM18/21             |                          |
| GRM32/43/55          |                          |
| LLA18/21/31          |                          |
| LLM21/31             | ∆T≦130°C                 |
| GNM                  |                          |
| ERB32                |                          |

#### **Recommended Conditions**

T . I. I. A

|                  | Pb-Sn S         | Lead Free Solder |              |
|------------------|-----------------|------------------|--------------|
|                  | Infrared Reflow | Leau Fiee Solder |              |
| Peak Temperature | 230 to 250°C    | 230 to 240°C     | 240 to 260°C |
| Atmosphere       | Air             | Air              | Air or N2    |
| Atmosphere       | Air             | Air              | Air or N2    |

Pb-Sn Solder: Sn-37Pb

Lead Free Solder: Sn-3.0Ag-0.5Cu

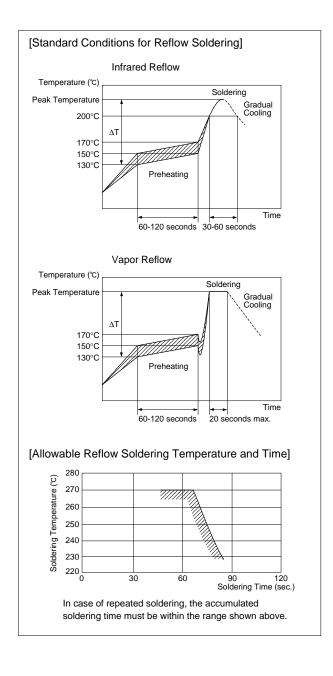

- 4. Optimum Solder Amount for Reflow Soldering
  - 4-1. Overly thick application of solder paste results in a excessive solder fillet height.

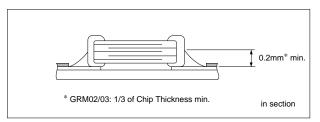

This makes the chip more susceptible to mechanical and thermal stress on the board and may cause the chips to crack.

- 4-2. Too little solder paste results in a lack of adhesive strength on the outer electrode, which may result in chips breaking loose from the PCB.
- 4-3. Make sure the solder has been applied smoothly to the end surface to a height of 0.2mm\* min.

#### Inverting the PCB

Make sure not to impose any abnormal mechanical shocks to the PCB.

Continued from the preceding page.

- 4-2. Flow Soldering
- When sudden heat is applied to the components, the mechanical strength of the components will decrease because a sudden temperature change causes deformation inside the components. In order to prevent mechanical damage in the components, preheating should be required for both of the components and the PCB board.

Preheating conditions are shown in table 2. It is required to keep temperature differential between the solder and the components surface ( $\Delta T$ ) as small as possible.

- Excessively long soldering time or high soldering temperature can result in leaching of the outer electrodes, causing poor adhesion or a reduction in capacitance value due to loss of contact between electrodes and end termination.
- When components are immersed in solvent after mounting, be sure to maintain the temperature difference (ΔT) between the component and solvent within the range shown in the table 2.
- 4. Do not apply flow soldering to chips not listed in table 2.

#### Table 2

| Part Number | Temperature Differential |
|-------------|--------------------------|
| GRM18/21/31 |                          |
| LLL21/31    | Δ <b>Τ</b> ≦150°C        |
| ERB18/21    | ∆1≥150°C                 |
| GQM18/21    |                          |

#### **Recommended Conditions**

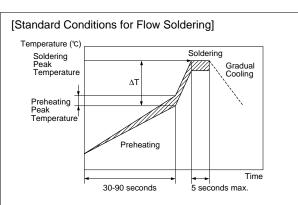

|                             | Pb-Sn Solder | Lead Free Solder |
|-----------------------------|--------------|------------------|
| Preheating Peak Temperature | 90 to 110°C  | 100 to 120°C     |
| Soldering Peak Temperature  | 240 to 250°C | 250 to 260°C     |
| Atmosphere                  | Air          | N2               |

Pb-Sn Solder: Sn-37Pb

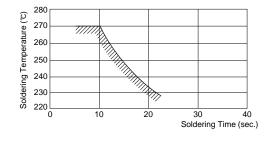

Lead Free Solder: Sn-3.0Ag-0.5Cu

5. Optimum Solder Amount for Flow Soldering

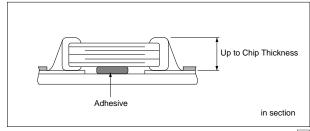

5-1. The top of the solder fillet should be lower than the thickness of components. If the solder amount is excessive, the risk of cracking is higher during board bending or any other stressful condition.

#### [Allowable Flow Soldering Temperature and Time]

In case of repeated soldering, the accumulated soldering time must be within the range shown above.

Continued from the preceding page.

4-3. Correction with a Soldering Iron

- 1. When sudden heat is applied to the components when using a soldering iron, the mechanical strength of the components will decrease because the extreme temperature change can cause deformations inside the components. In order to prevent mechanical damage to the components, preheating is required for both the components and the PCB board. Preheating conditions, (The "Temperature of the Soldering Iron Tip", "Preheating Temperature", "Temperature Differential" between the iron tip and the components and the PCB), should be within the conditions of table 3. It is required to keep the temperature differential between the soldering iron and the component surfaces ( $\Delta$ T) as small as possible.
- 2. After soldering, do not allow the component/PCB to rapidly cool down.
- 3. The operating time for the re-working should be as short as possible. When re-working time is too long, it may cause solder leaching, and that will cause a reduction in the adhesive strength of the terminations.
- 4. Optimum Solder amount when re-working with a Soldering Iron
  - 4-1. In case of sizes smaller than 0603, (GRM03/15/18, GJM03/15, GQM18, ERB18), the top of the solder fillet should be lower than 2/3's of the thickness of the component or 0.5mm whichever is smaller. In case of 0805 and larger sizes, (GRM21/31/32/43/55, GQM21, ERB21/32), the top of the solder fillet should be lower than 2/3's of the thickness of the component. If the solder amount is excessive, the risk of cracking is higher during board bending or under any other stressful condition.
  - 4-2. A soldering iron with a tip of ø3mm or smaller should be used. It is also necessary to keep the soldering iron from touching the components during the re-work.
  - 4-3. Solder wire with Ø0.5mm or smaller is required for soldering.

#### 4-4. Leaded Component Insertion

 If the PCB is flexed when leaded components (such as transformers and ICs) are being mounted, chips may crack and solder joints may break.

Before mounting leaded components, support the PCB using backup pins or special jigs to prevent warping.

#### 5. Washing

148

Excessive ultrasonic oscillation during cleaning can cause the PCBs to resonate, resulting in cracked chips or broken solder joints. Take note not to vibrate PCBs.

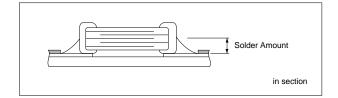

#### Table 3

| Part Number   | Temperature<br>of Soldering<br>Iron Tip | Preheating<br>Temperature | Temperature<br>Differential<br>(∆T) | Atmosphere |
|---|---|---------------------------|-------------------------------------|------------|
| GRM03/15/18/21/31<br>GJM03/15<br>GQM18/21<br>ERB18/21 | 350°C max.                              | 150°C min.                | ∆T≦190°C                            | Air        |
| GRM32/43/55<br>ERB32                                  | 280°C max.                              | 150°C min.                | ∆T≦130°C                            | Air        |

\*Applicable for both Pb-Sn and Lead Free Solder.

Pb-Sn Solder: Sn-37Pb

Lead Free Solder: Sn-3.0Ag-0.5Cu

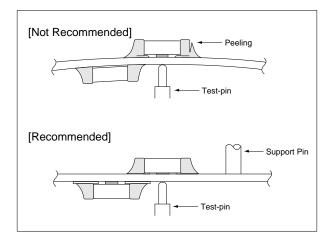

### **Caution**

 $\fbox$  Continued from the preceding page.

- 6. Electrical Test on Printed Circuit Board
- Confirm position of the support pin or specific jig, when inspecting the electrical performance of a capacitor after mounting on the printed circuit board.
  - 1-1. Avoid bending printed circuit board by the pressure of a test pin, etc.The thrusting force of the test probe can flex the PCB, resulting in cracked chips or open solder joints.

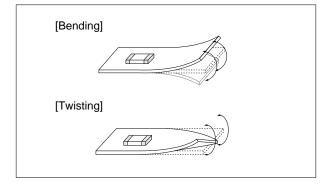

Provide support pins on the back side of the PCB to prevent warping or flexing.

1-2. Avoid vibration of the board by shock when a test pin contacts a printed circuit board.

- 7. Printed Circuit Board Cropping
- 1. After mounting a capacitor on a printed circuit board, do not apply any stress to the capacitor that is caused by bending or twisting the board.
  - 1-1. In cropping the board, the stress as shown right may cause the capacitor to crack.

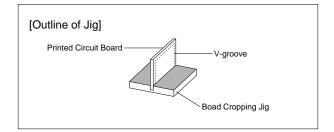

Try not to apply this type of stress to a capacitor.

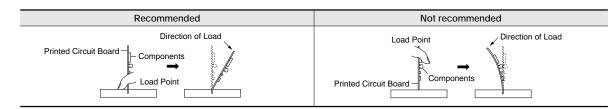

- 2. Check of the cropping method for the printed circuit board in advance.
  - 2-1. Printed circuit board cropping shall be carried out by using a jig or an apparatus to prevent the mechanical stress which can occur to the board.
    - (1) Example of a suitable jig

Recommended example: the board should be pushed as close to the near the cropping jig as possible and from the back side of board in order to minimize the compressive stress applied to capacitor.

Not recommended example\* when the board is pushed at a point far from the cropping jig and from the front side of board as below, the capacitor may form a crack caused by the tensile stress applied to capacitor.

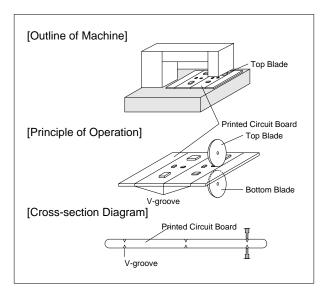

Continued from the preceding page.

(2) Example of a suitable machine An outline of a printed circuit board cropping machine is shown as follows. Along the lines with the V-grooves on printed circuit board, the top and bottom blades are aligned to one another when cropping the board.

The misalignment of the position between top and bottom blades may cause the capacitor to crack.

#### Others

- 1. Under Operation of Equipment
  - 1-1. Do not touch a capacitor directly with bare hands during operation in order to avoid the danger of a electric shock.
  - 1-2. Do not allow the terminals of a capacitor to come in contact with any conductive objects (short-circuit). Do not expose a capacitor to a conductive liquid, inducing any acid or alkali solutions.
  - 1-3. Confirm the environment in which the equipment will operation is under the specified conditions.Do not use the equipment under the following environment.
    - (1) Being spattered with water or oil.
    - (2) Being exposed to direct sunlight.
    - (3) Being exposed to Ozone, ultraviolet rays or radiation.
    - (4) Being exposed to toxic gas (e.g., hydrogen sulfide, sulfur dioxide, chlorine, ammonia gas, etc.)
    - (5) Any vibrations or mechanical shocks exceeding the specified limits.
    - (6) Moisture condensing environments.
  - 1-4. Use damp proof countermeasures if using under any conditions that can cause condensation.
- 2. Others
  - 2-1. In an Emergency
    - If the equipment should generate smoke, fire or smell, immediately turn off or unplug the equipment.

If the equipment is not turned off or unplugged, the hazards may be worsened by supplying continuous power.

- (2) In this type of situation, do not allow face and hands to come in contact with the capacitor or burns may be caused by the capacitors high temperature.
- 2-2. Disposal of Waste
  - When capacitors are disposed, they must be burned or buried by the industrial waste vender with the appropriate licenses.
- 2-3. Circuit Design

GRM, GCM, GMA/D, LLL/A/M, ERB, GQM, GJM, GNM Series capacitors in this catalog are not safety certified products.

2-4. Remarks

Failure to follow the cautions may result, worst case, in a short circuit and smoking when the product is used.

The above notices are for standard applications and conditions. Contact us when the products are used in special mounting conditions.

Select optimum conditions for operation as they determine the reliability of the product after assembly. The data herein are given in typical values, not guaranteed ratings.

Note • This PDF catalog is downloaded from the website of Murata Manufacturing co., Itd. Therefore, it's specifications are subject to change or our products in it may be discontinued without advance notice. Please check with our sales representatives or product spineliness before ordering.
 This PDF catalog has only typical specifications because there is no space for detailed specifications. Therefore, please approve our product specifications or transact the approval sheet for product specifications before ordering.
 Op. 18

### Notice

#### Rating

- 1. Operating Temperature
  - 1. The operating temperature limit depends on the capacitor.
    - 1-1. Do not apply temperatures exceeding the upper operating temperature.

It is necessary to select a capacitor with a suitable rated temperature which will cover the operating temperature range.

Also it is necessary to consider the temperature distribution in equipment and the seasonal temperature variable factor.

- 1-2. Consider the self-heating of the capacitor The surface temperature of the capacitor shall be the upper operating temperature or less when including the self-heating factors.
- 2. Atmosphere Surroundings (gaseous and liquid)
- 1. Restriction on the operating environment of capacitors.
  - 1-1. The capacitor, when used in the above, unsuitable, operating environments may deteriorate due to the corrosion of the terminations and the penetration of moisture into the capacitor.

- 1-2. The same phenomenon as the above may occur when the electrodes or terminals of the capacitor are subject to moisture condensation.
- 1-3. The deterioration of characteristics and insulation resistance due to the oxidization or corrosion of terminal electrodes may result in breakdown when the capacitor is exposed to corrosive or volatile gases or solvents for long periods of time.
- 3. Piezo-electric Phenomenon
  - When using high dielectric constant type capacitors in AC or pulse circuits, the capacitor itself vibrates at specific frequencies and noise may be generated. Moreover, when the mechanical vibration or shock is added to capacitor, noise may occur.

#### Soldering and Mounting

- 1. PCB Design
- 1. Notice for Pattern Forms
  - 1-1. Unlike leaded components, chip components are susceptible to flexing stresses since they are mounted directly on the substrate.

They are also more sensitive to mechanical and thermal stresses than leaded components.

Excess solder fillet height can multiply these stresses and cause chip cracking. When designing substrates, take land patterns and dimensions into consideration to eliminate the possibility of excess solder fillet height.

1-2. It is possible for the chip to crack by the expansion and shrinkage of a metal board. Please contact us if you want to use our ceramic capacitors on a metal board such as Aluminum.

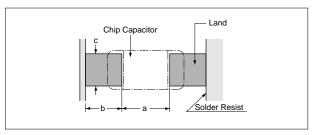

#### Pattern Forms

|   | Prohibited                                      | Correct       |
|---|---|---------------|

| Placing<br>of Chip Components<br>and Leaded Components  | Lead Wire                                       | Solder Resist |
| Placing<br>of Leaded Components<br>after Chip Component | Soldering Iron<br>Lead Wire                     | Solder Resist |
| Lateral Mounting  |   | Solder Resist |

Continued from the preceding page.

- 2. Land Dimensions
  - 2-1. Chip capacitor can be cracked due to the stress of PCB bending / etc if the land area is larger than needed and has an excess amount of solder.
    Please refer to the land dimensions in table 1 for flow soldering, table 2 for reflow soldering, table 3 for GNM & LLA, and table 4 for LLM.
    Please confirm the suitable land dimension by evaluating of the actual SET / PCB.

b=(c-e)/2, b'=(d-f)/2

#### 2. Adhesive Application

 Thin or insufficient adhesive can cause the chips to loosen or become disconnected during flow soldering. The amount of adhesive must be more than dimension c, shown in the drawing at right, to obtain the correct bonding strength.

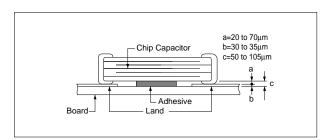

The chip's electrode thickness and land thickness must also be taken into consideration.

 Low viscosity adhesive can cause chips to slip after mounting. The adhesive must have a viscosity of 5000Pa • s (500ps) min. (at 25°C).

#### 3. Adhesive Coverage

| Part Number         | Adhesive Coverage* |  |  |
|---------------------|--------------------|--|--|
| GRM18, GQM18        | 0.05mg min.        |  |  |
| GRM21, LLL21, GQM21 | 0.1mg min.         |  |  |
| GRM31, LLL31        | 0.15mg min.        |  |  |

\*Nominal Value

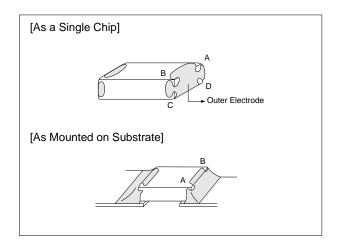

Continued from the preceding page.

- 3. Adhesive Curing
- Insufficient curing of the adhesive can cause chips to disconnect during flow soldering and causes deterioration in the insulation resistance between the outer electrodes due to moisture absorption.
   Control curing temperature and time in order to prevent
- insufficient hardening.
- 4. Flux Application
- An excessive amount of flux generates a large quantity of flux gas, which can cause a deterioration of Solderability. So apply flux thinly and evenly throughout. (A foaming system is generally used for flow soldering).
- 2. Flux containing too a high percentage of halide may cause corrosion of the outer electrodes unless there is sufficient cleaning. Use flux with a halide content of 0.2% max.
- 5. Flow Soldering
- Set temperature and time to ensure that leaching of the outer electrode does not exceed 25% of the chip end area as a single chip (full length of the edge A-B-C-D shown right) and 25% of the length A-B shown below as mounted on substrate.

- 3. Do not use strong acidic flux.
- 4. Do not use water-soluble flux.
  - (\*Water-soluble flux can be defined as non rosin type flux including wash-type flux and non-wash-type flux.)

- 6. Washing
- 1. Please evaluate a capacitor by actual cleaning equipment and condition surely for confirming the quality and select the applicable solvent.
- 2. Unsuitable cleaning solvent may leave residual flux, other foreign substances, causing deterioration of electrical characteristics and the reliability of the capacitors.
- 3. Select the proper cleaning conditions.
  - 3-1. Improper cleaning conditions (excessive or insufficient) may result in the deterioration of the performance of the capacitors.

Continued from the preceding page.

- 7. Coating
- A crack may be caused in the capacitor due to the stress of the thermal contraction of the resin during curing process.

The stress is affected by the amount of resin and curing contraction.

Select a resin with small curing contraction. The difference in the thermal expansion coefficient between a coating resin or a molding resin and capacitor may cause the destruction and deterioration of the capacitor such as a crack or peeling, and lead to the deterioration of insulation resistance or dielectric breakdown.

#### 8. Die Bonding/Wire Bonding (GMA or GMD Series)

- 1. Die Bonding of Capacitors
  - Use the following materials for the Brazing alloys:
  - Au-Sn (80/20) 300 to 320 degree C in N<sub>2</sub> atmosphere Mounting
  - (1) Control the temperature of the substrate so it matches the temperature of the brazing alloy.
  - (2) Place the brazing alloy on the substrate and place the capacitor on the alloy. Hold the capacitor and gently apply the load. Be sure to complete the operation within 1 minute.

Select a resin for which the thermal expansion coefficient is as close to that of capacitor as possible.

A silicone resin can be used as an under-coating to buffer against the stress.

2. Select a resin that is less hygroscopic.

Using hygroscopic resins under high humidity conditions may cause the deterioration of the insulation resistance of a capacitor.

An epoxy resin can be used as a less hygroscopic resin.

- 2. Wire Bonding
  - Wire
    - Gold wire: 25 micro m (0.001 inch) diameter
  - Bonding
  - (1) Thermo compression, ultrasonic ball bonding.
  - (2) Required stage temperature: 150 to 200 degree C
  - (3) Required wedge or capillary weight: 0.2N to 0.5N
  - (4) Bond the capacitor and base substrate or other devices with gold wire.

## Notice

#### Others

- 1. Transportation
  - 1. The performance of a capacitor may be affected by the conditions during transportation.
    - 1-1. The capacitors shall be protected against excessive temperature, humidity and mechanical force during transportation.
      - (1) Climatic condition
        - low air temperature: -40°C
        - change of temperature air/air: -25°C/+25°C
        - low air pressure: 30 kPa
        - change of air pressure: 6 kPa/min.
      - (2) Mechanical condition

Transportation shall be done in such a way that the boxes are not deformed and forces are not directly passed on to the inner packaging.

- 1-2. Do not apply excessive vibration, shock, and pressure to the capacitor.
  - (1) When excessive mechanical shock or pressure is applied to a capacitor, chipping or cracking may occur in the ceramic body of the capacitor.
  - (2) When a sharp edge of an air driver, a soldering iron, tweezers, a chassis, etc. impacts strongly on the surface of capacitor, the capacitor may crack and short-circuit.
- 1-3. Do not use a capacitor to which excessive shock was applied by dropping, etc. The capacitor dropped accidentally during processing may be damaged.

(2) Test Samples

(4) Results

(3) Acceptance Criteria

Refer to Table 1.

GRM21 : Products for flow/reflow soldering.

With a 60-power optical microscope, measure the surface

area of the outer electrode that is covered with solder.

## **Reference Data**

- 1. Solderability
- (1) Test Method

Subject the chip capacitor to the following conditions. Then apply flux (an ethanol solution of 25% rosin) to the chip and dip it in 230°C eutectic solder for 2 seconds. Conditions:

Expose prepared at room temperature (for 6 months and 12 months, respectively)

Prepared at high temperature (for 100 hours at 85°C) Prepared left at high humidity (for 100 hours under 90%RH to 95%RH at 40°C)

#### Table 1

 Sample
 Initial State
 Prepared at Room Temperature
 Prepared at High Temperature for 100 Hours at 85°c
 Prepared at High Temperature for 100 Hours at 90 to 95% RH and 40°c

2. Board Bending Strength for Solder Fillet Height

#### (1) Test Method

Solder the chip capacitor to the test PCB with the amount of solder paste necessary to achieve the fillet heights. Then bend the PCB using the method illustrated and measure capacitance.

#### (2) Test Samples

GRM21: 5C/R7/F5 Characteristics T=0.6mm

(3) Acceptance Criteria

Downloaded from Elcodis.com electronic components distributor

Products should be determined to be defective if the change in capacitance has exceeded the values specified in Table 2.

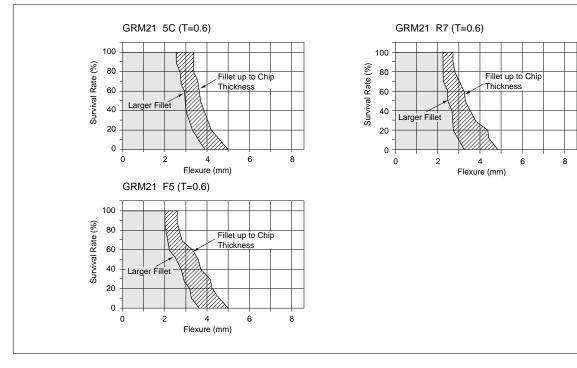

#### Table 2

| Characteristics | Change in Capacitance                                  |
|-----------------|--|
| 5C              | Within $\pm 5\%$ or $\pm 0.5$ pF, whichever is greater |
| R7              | Within ±12.5%  |
| F5              | Within ±20%  |

Continued from the preceding page.

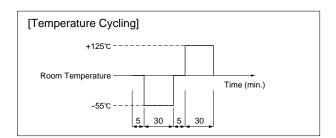

#### (4) Results

#### 3. Temperature Cycling for Solder Fillet Height

#### (1) Test Method

Solder the chips to the substrate of various test fixtures using sufficient amounts of solder to achieve the required fillet height. Then subject the fixtures to the cycle illustrated below 200 times.

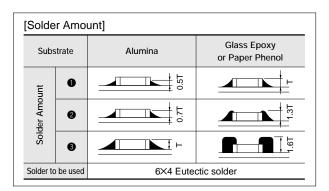

Alumina substrates are typically designed for reflow soldering.

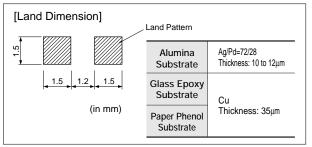

Glass epoxy or paper phenol substrates are typically used for flow soldering.

2 Material

| Alumina      | (Thickness: 0.64mm) |
|--------------|---------------------|
| Glass epoxy  | (Thickness: 1.64mm) |
| Paper phenol | (Thickness: 1.64mm) |

③ Land Dimension

Continued from the preceding page.

(2) Test Samples

GRM21 5C/R7/F5 Characteristics T=0.6mm

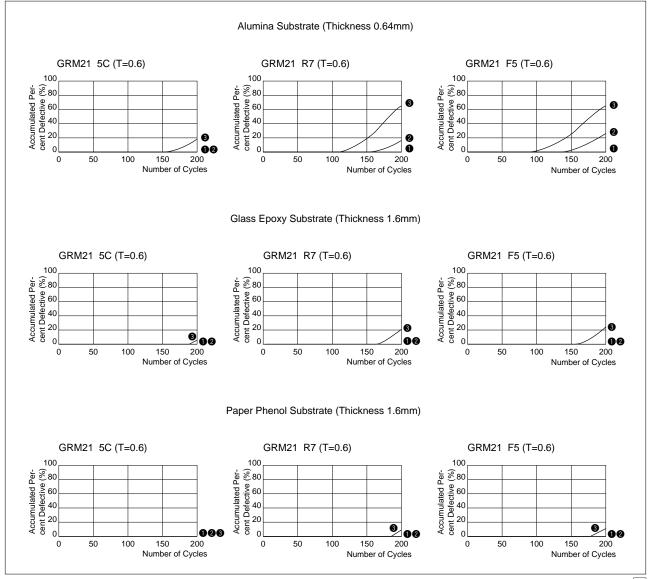

(3) Acceptance Criteria

Products are determined to be defective if the change in capacitance has exceeded the values specified in Table 3.

| Table | 3 |
|-------|---|
|-------|---|

| Characteristics | Change in Capacitance                                     |
|-----------------|---|
| 5C              | Within $\pm 2.5\%$ or $\pm 0.25$ pF, whichever is greater |
| R7              | Within ±7.5%  |
| F5              | Within ±20%   |

#### (4) Results

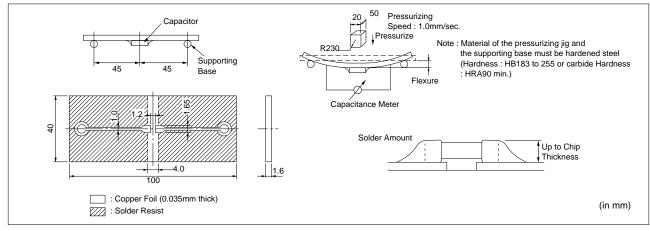

Continued from the preceding page.

- 4. Board Bending Strength for Board Material
- (1) Test Method

Solder the chip to the test board. Then bend the board using the method illustrated below, to measure capacitance.

#### (2) Test Samples

GRM21 5C/R7/F5 Characteristics T=0.6mm typical

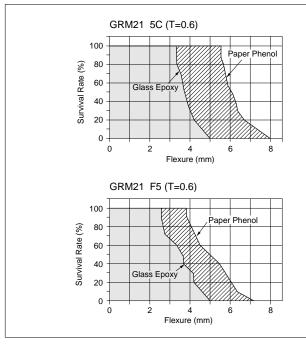

#### (3) Acceptance Criteria

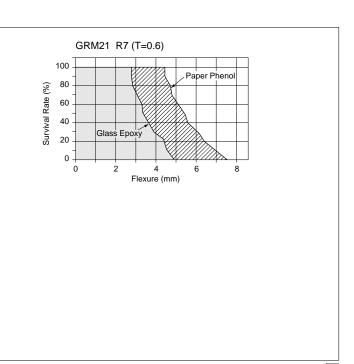

Products should be determined to be defective if the change in capacitance has exceeded the values specified in Table 4.

#### Table 4

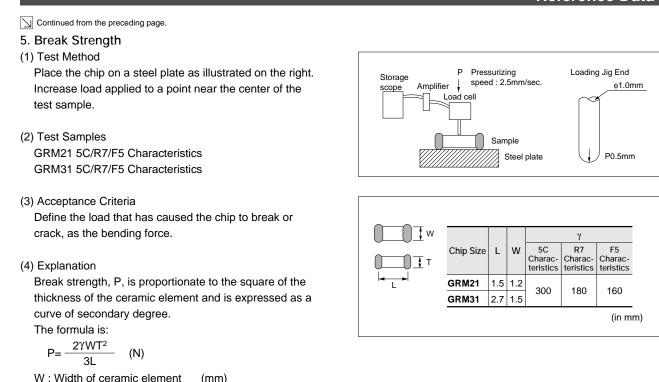

| Characteristics | Change in Capacitance                                |
|-----------------|--|
| 5C              | Within $\pm$ 5% or $\pm$ 0.5pF, whichever is greater |
| R7              | Within $\pm 12.5\%$                                  |
| F5              | Within ±20%  |

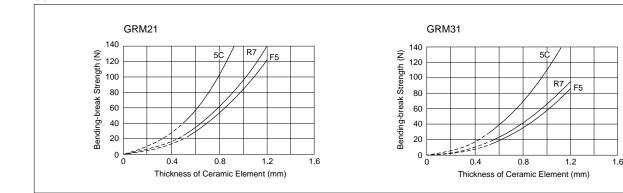

#### (4) Results

#### 6. Thermal Shock

T: Thickness of element

γ: Bending stress

(5) Results

L : Distance between fulcrums

(1) Test method

After applying flux (an ethanol solution of 25% rosin), dip the chip in a solder bath (6×4 eutectic solder) in accordance with the following conditions:

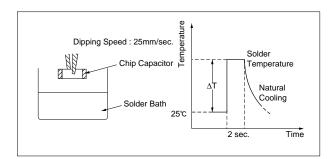

(mm)

(mm)

(N/mm<sup>2</sup>)

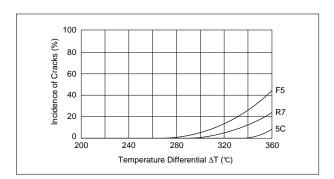

- (2) Test samples GRM21 5C/R7/F5 Characteristics T=0.6mm typical
- (3) Acceptance criteria

Visually inspect the test sample with a 60-power optical microscope. Chips exhibiting breaks or cracks should be determined to be defective.

- Continued from the preceding page.
- (4) Results

#### 7. Solder Heat Resistance

- (1) Test Method
  - Reflow soldering:

Apply about  $300 \ \mu m$  of solder paste over the alumina substrate. After reflow soldering, remove the chip and check for leaching that may have occurred on the outer electrode.

2 Flow soldering:

After dipping the test sample with a pair of tweezers in wave solder (eutectic solder), check for leaching that may have occurred on the outer electrode.

(2) Test samples

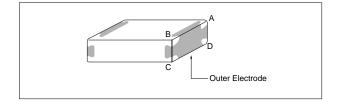

GRM21: For flow/reflow soldering T=0.6mm

(3) Acceptance criteria

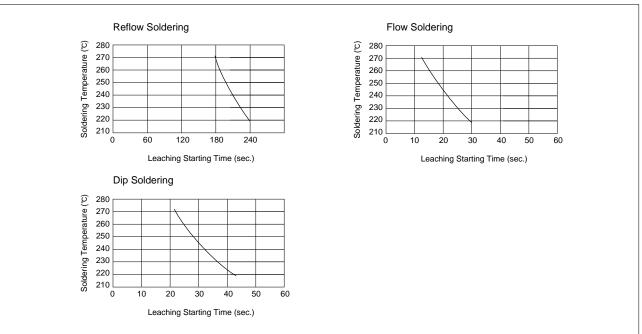

The starting time of leaching should be defined as the time when the outer electrode has lost 25% of the total edge length of A-B-C-D as illustrated:

#### ③ Dip soldering:

- After dipping the test sample with a pair of tweezers in static solder (eutectic solder), check for leaching that may have occurred on the outer electrode.
- ④ Flux to be used: An ethanol solution of 25% rosin.

#### (4) Results

Continued from the preceding page.

#### 8. Thermal Shock when Making Corrections with a Soldering Iron

(1) Test Method

Apply a soldering iron meeting the conditions below to the soldered joint of a chip that has been soldered to a paper phenol board, while supplying wire solder. (Note: the soldering iron tip should not directly touch the ceramic element of the chip.)

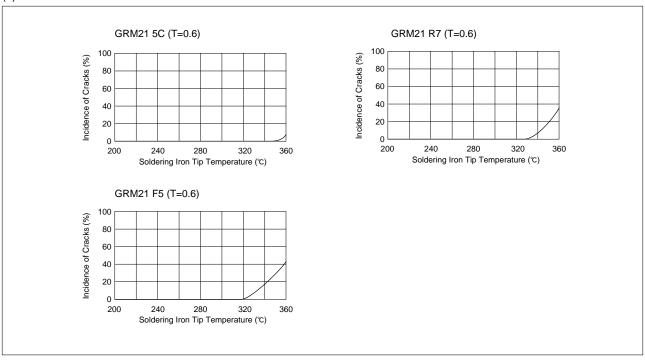

(2) Test Samples

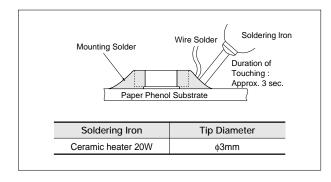

GRM21 5C/R7/F5 Characteristics T=0.6mm

(3) Acceptance Criteria for Defects

Observe the appearance of the test sample with a 60-power optical microscope. Those units displaying any breaks or cracks are determined to be defective.

# **Chip Monolithic Ceramic Capacitors**

# muRata

# **Medium Voltage Low Dissipation Factor**

#### Features

- 1. Low-loss and suitable for high frequency circuits
- 2. Murata's original internal electrode structure realizes high flash-over voltage.
- A new monolithic structure for small, surfacemountable devices capable of operating at high voltage levels
- 4. Sn-plated external electrodes realize good solderability.
- 5. Use the GRM21/31 type with flow or reflow soldering, and other types with reflow soldering only.

#### Applications

Ideal for use on high frequency pulse circuits such as snubber circuits for switching power supplies, DC-DC converters, ballasts (inverter fluorescent lamps), etc.

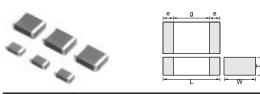

9

Do not use these products in any Automotive Power train or Safety equipment including Battery charger for Electric Vehicles and Plug-in Hybrid. Only Murata products clearly stipulated as "for Automotive use" on its catalog can be used for automobile applications such as Power train and Safety equipment.

\*: In case of use C0G char., DC630V product with pulse voltage, be sure not to use with 10kHz and less pulse or ripple voltage condition. and these product are not suitable for commercial power line voltage application, such as AC filter. For those applications, be sure to use AC voltage rating product.(GA2/GA3 series)

GRM43Q

GRM43D

GRM550

# **Chip Monolithic Ceramic Capacitors**

# muRata

2.2

3.2

# Medium Voltage High Capacitance for General Use

#### Features

- 1. A new monolithic structure for small, high capacitance capable of operating at high voltage levels.
- 2. Sn-plated external electrodes realizes good solderability.
- 3. Use the GRM18/21/31 types with flow or reflow soldering, and other types with reflow soldering only.

#### Applications

- 1. Ideal for use on diode-snubber circuits for switching power supplies.
- 2. Ideal for use as primary-secondary coupling for DC-DC converter.
- 3. Ideal for use on line filters and ringer detectors for telephones, facsimiles and modems.

Do not use these products in any Automotive Power train or Safety equipment including Battery charger for Electric Vehicles and Plug-in Hybrid. Only Murata products clearly stipulated as "for Automotive use" on its catalog can be used for automobile applications such as Power train and Safety equipment.

#### Features

- 1. Low-loss and suitable for high frequency circuits
- 2. Murata's original internal electrode structure realizes high flash-over voltage.
- 3. A new monolithic structure for small, surfacemountable devices capable of operating at high voltage levels.
- 4. Sn-plated external electrodes realize good solderability.
- 5. Only for reflow soldering
- The capacitors less than 22pF can be applied maximum 4.0kV peak to peak at 100kHz or less only for the ballast or the resonance usage in the LCD backlight inverter circuit.

#### Applications

Ideal for use as the ballast in LCD backlight inverter.

Do not use these products in any Automotive Power train or Safety equipment including Battery charger for Electric Vehicles and Plug-in Hybrid. Only Murata products clearly stipulated as "for Automotive use" on its catalog can be used for automobile applications such as Power train and Safety equipment.

# muRata

## **Only for Information Devices**

## Features

- These items are designed specifically for telecommunications devices (IEEE802.3) in Ethernet LAN and primary-secondary coupling for DC-DC converter.
- 2. A new monolithic structure for small, high capacitance capable of operating at high voltage levels
- Sn-plated external electrodes realizes good solderability.
- 4. Only for reflow soldering
- 5. The low-profile type (thickness: 1.5mm max.) is available. Fit for use on thinner type equipment.

## Applications

- 1. Ideal for use on telecommunications devices in Ethernet LAN
- Ideal for use as primary-secondary coupling for DC-DC converter

Do not use these products in any Automotive Power train or Safety equipment including Battery charger for Electric Vehicles and Plug-in Hybrid. Only Murata products clearly stipulated as "for Automotive use" on its catalog can be used for automobile applications such as Power train and Safety equipment.

# **Chip Monolithic Ceramic Capacitors**

# muRata

## **Only for Camera Flash Circuit**

## Features

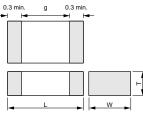

- 1. Suitable for the trigger of the flash circuit, because real capacitance is stable during operating voltage.
- 2. The thin type fit for thinner camera.
- 3. Sn-plated external electrodes realizes good solderability.
- 4. For flow and reflow soldering

## Applications

For strobe circuit

Do not use these products in any Automotive Power train or Safety equipment including Battery charger for Electric Vehicles and Plug-in Hybrid. Only Murata products clearly stipulated as Ågfor Automotive useÅh on its catalog can be used for automobile applications such as Power train and Safety equipment.

# muRata

## AC250V (r.m.s.) Type (Which Meet Japanese Law)

### Features

- 1. Chip monolithic ceramic capacitor for AC lines.
- 2. A new monolithic structure for small, high
- capacitance capable of operating at high voltage levels.
- 3. Sn-plated external electrodes realizes good solderability.
- 4. Only for reflow soldering
- 5. Capacitance 0.01 to 0.1uF for connecting lines and 470 to 4700pF for connecting lines to earth.

### Applications

Noise suppression filters for switching power supplies, telephones, facsimiles, modems.

Do not use these products in any Automotive Power train or Safety equipment including Battery charger for Electric Vehicles and Plug-in Hybrid. Only Murata products clearly stipulated as "for Automotive use" on its catalog can be used for automobile applications such as Power train and Safety equipment.

#### Reference Standard

GA2 series obtains no safety approval. This series is based on the standards of the electrical appliance and material safety law of Japan (separated table 4).

# **Chip Monolithic Ceramic Capacitors**

## Safety Standard Certified Type GC (UL, IEC60384-14 Class X1/Y2)

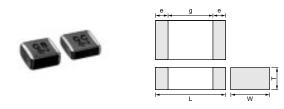

### Features

- 1. Chip monolithic ceramic capacitor (certified as conforming to safety standards) for AC lines.
- 2. A new monolithic structure for small, high capacitance capable of operating at high voltage levels.
- Compared to lead type capacitors, this new capacitor is greatly downsized and low-profiled to 1/10 or less in volume, and 1/4 or less in height.
- 4. The type GC can be used as an X1-class and Y2-class capacitor, line-by-pass capacitor of UL1414.
- 5. +125 degree C guaranteed
- 6. Only for reflow soldering

#### Applications

- 1. Ideal for use as Y capacitor or X capacitor for various switching power supplies
- 2. Ideal for modem applications

Do not use these products in any Automotive Power train or Safety equipment including Battery charger for Electric Vehicles and Plug-in Hybrid. Only Murata products clearly stipulated as "for Automotive use" on its catalog can be used for automobile applications such as Power train and Safety equipment.

# muRata

## Safety Standard Certified Type GD (IEC60384-14 Class Y3)

## Features

- 1. Available for equipment based on IEC/EN60950 and UL1950
- 2. The type GD can be used as a Y3-class capacitor.
- 3. A new monolithic structure for small, high capacitance capable of operating at high voltage levels
- 4. +125 degree C guaranteed
- 5. Only for reflow soldering
- 6. The low-profile type (thickness: 1.5mm max.) is available. Fit for use on thinner type equipment.
- Applications
- 1. Ideal for use on line filters and couplings for DAA modems without transformers
- 2. Ideal for use on line filters for information equipment

Do not use these products in any Automotive Power train or Safety equipment including Battery charger for Electric Vehicles and Plug-in Hybrid. Only Murata products clearly stipulated as "for Automotive use" on its catalog can be used for automobile applications such as Power train and Safety equipment.

## Safety Standard Certified Type GF (IEC60384-14 Class Y2, X1/Y2)

- Features
- 1. Available for equipment based on IEC/EN60950 and UL1950. Besides, the GA352/355 types are available for equipment based on IEC/EN60065, UL1492, and UL6500
- 2. The type GF can be used as a Y2-class capacitor.
- A new monolithic structure for small, high capacitance capable of operating at high voltage levels
- 4. +125 degree C guaranteed
- 5. Only for reflow soldering
- 6. The low-profile type (thickness: 1.5mm max.) is available. Fit for use on thinner type equipment.
- Applications
- 1. Ideal for use on line filters and couplings for DAA modems without transformers
- 2. Ideal for use on line filters for information equipment
- Ideal for use as Y capacitor or X capacitor for various switching power supplies (GA352/355 types only)

Do not use these products in any Automotive Power train or Safety equipment including Battery charger for Electric Vehicles and Plug-in Hybrid. Only Murata products clearly stipulated as "for Automotive use" on its catalog can be used for automobile applications such as Power train and Safety equipment.

## Safety Standard Certified Type GB (IEC60384-14 Class X2)

### Features

- 1. The type GB can be used as an X2-class capacitor.
- 2. Chip monolithic ceramic capacitor (certified as conforming to safety standards) for AC lines
- 3. A new monolithic structure for small, high capacitance capable of operating at high voltage levels
- Compared to lead type capacitors, this new capacitor is greatly downsized and low-profiled to 1/10 or less in volume, and 1/4 or less in height.
- 5. +125 degree C guaranteed
- 6. Only for reflow soldering

### Applications

Ideal for use as X capacitor for various switching power supplies

Do not use these products in any Automotive Power train or Safety equipment including Battery charger for Electric Vehicles and Plug-in Hybrid. Only Murata products clearly stipulated as "for Automotive use" on its catalog can be used for automobile applications such as Power train and Safety equipment.

## Package

- Continued from the preceding page.
- (4) Taping Method
  - Tapes for capacitors are wound clockwise. The sprocket holes are to the right as the tape is pulled toward the user.
  - ② Part of the leader and part of the empty tape should be attached to the end of the tape as shown at right.
  - ③ The top tape or cover tape and base tape are not attached at the end of the tape for a minimum of 5 pitches.
  - ④ Missing capacitors number within 0.1% of the number per reel or 1 pc, whichever is greater, and are not continuous.
  - (5) The top tape or cover tape and bottom tape should not protrude beyond the edges of the tape and should not cover sprocket holes.
  - (6) Cumulative tolerance of sprocket holes, 10 pitches:  $\pm 0.3$ mm.
  - $\ensuremath{\overline{\mathcal{O}}}$  Peeling off force: 0.1 to 0.6N in the direction shown at right.

## 

## Storage and Operating Conditions

Operating and storage environment

Do not use or store capacitors in a corrosive atmosphere, especially where chloride gas, sulfide gas, acid, alkali, salt or the like are present. And avoid exposure to moisture. Before cleaning, bonding or molding this product, verify that these processes do not affect product quality by testing the performance of a cleaned, bonded or molded product in the intended equipment. Store the capacitors where the temperature and relative humidity do not exceed 5 to 40 degrees centigrade and 20 to 70%.

### Handling

- Vibration and impact Do not expose a capacitor to excessive shock or vibration during use.
- 2. Do not directly touch the chip capacitor, especially the ceramic body. Residue from hands/fingers may create a short circuit environment.

FAILURE TO FOLLOW THE ABOVE CAUTIONS MAY RESULT, WORST CASE, IN A SHORT CIRCUIT AND CAUSE FUMING OR PARTIAL DISPERSION WHEN THE PRODUCT IS USED. Use capacitors within 6 months after delivered. Check the solderability after 6 months or more.

FAILURE TO FOLLOW THE ABOVE CAUTIONS MAY RESULT, WORST CASE, IN A SHORT CIRCUIT AND CAUSE FUMING OR PARTIAL DISPERSION WHEN THE PRODUCT IS USED.

#### Caution (Rating)

#### 1. Operating Voltage

When DC-rated capacitors are to be used in AC or ripple current circuits, be sure to maintain the Vp-p value of the applied voltage or the Vo-p which contains DC bias within the rated voltage range.

When the voltage is applied to the circuit, starting or stopping may generate irregular voltage for a transit period because of resonance or switching. Be sure to use a capacitor with a rated voltage range that includes these irregular voltages.

When DC-rated capacitors are to be used in input circuits from commercial power source (AC filter), be sure to use Safety Certified Capacitors because various regulations on withstand voltage or impulse withstand established for each equipment should be taken into considerations.

| Voltage                   | DC Voltage | DC+AC Voltage | AC Voltage | Pulse Voltage (1) | Pulse Voltage (2) |
|---------------------------|------------|---------------|------------|-------------------|-------------------|
| Positional<br>Measurement | Vo-p       | Vo-p          | Vp-p       | Vp-p              | Vp-p              |

- 2. Operating Temperature, Self-generated Heat, and Load Reduction at High-frequency Voltage Condition Keep the surface temperature of a capacitor below the upper limit of its rated operating temperature range. Be sure to take into account the heat generated by the capacitor itself. When the capacitor is used in a highfrequency voltage, pulse voltage, it may self-generate heat due to dielectric loss.
- (1) In case of X7R char.

Applied voltage should be the load such as selfgenerated heat is within 20°C on the condition of atmosphere temperature 25°C. When measuring, use a thermocouple of small thermal capacity -K of ø0.1mm in conditions where the capacitor is not affected by radiant heat from other components or surrounding ambient fluctuations. Excessive heat may lead to deterioration of the capacitor's characteristics and reliability. (Never attempt to perform measurement with the cooling fan running. Otherwise, accurate measurement cannot be ensured.)

Continued on the following page.

## 

Continued from the preceding page.

(2) In case of C0G, U2J char.

Due to the low self-heating characteristics of lowdissipation capacitors, the allowable electric power of these capacitors is generally much higher than that of X7R characteristic capacitors.

When a high frequency voltage which cause 20°C self heating to the capacitor is applied, it will exceed capacitor's allowable electric power.

The frequency of the applied sine wave voltage should be less than 500kHz (less than 100kHz in case of rated voltage: DC3.15kV). The applied voltage should be less than the value shown in figure below.

While, in case of non-sine wave which include a harmonic frequency, please contact our sales representatives or product engineers. Excessive heat may lead to deterioration of the capacitor's characteristics and reliability. (Never attempt to perform measurement with the cooling fan running. Otherwise, accurate measurement cannot be ensured.)

<C0G char., Rated Voltage: DC3.15kV>

The capacitors less than 22pF can be applied maximum 4.0kV peak to peak at 100kHz or less only for the ballast or the resonance usage in the LCD backlight inverter circuit.

<Capacitor Selection Tool>

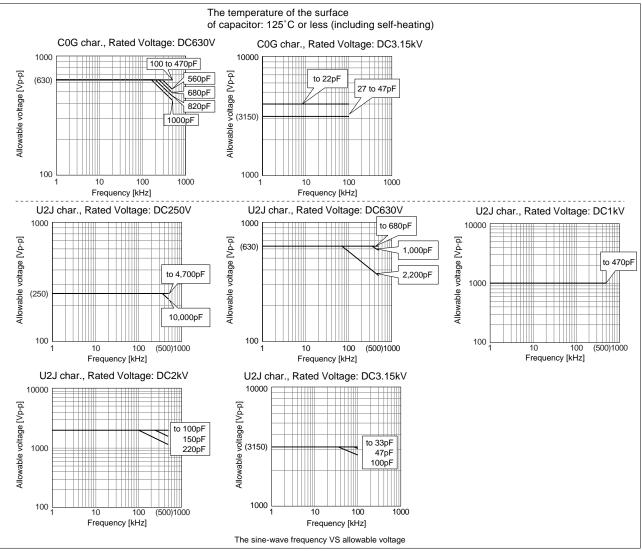

We are also offering free software the "capacitor selection tool: Murata Medium Voltage Capacitors Selection Tool by Voltage Form (\*)" which will assist you in selecting a suitable capacitor.

The software can be downloaded from Murata's Internet Website.

(http://www.murata.com/designlib/mmcsv\_e.html). By inputting capacitance values and applied voltage waveform of the specific capacitor series, this software will calculate the capacitor's power consumption and list suitable capacitors (non-sine wave is also available).

\* Subject series are below.

· Temperature Characteristics C0G, U2J

muRata

it should be applied with the zero cross\*. At the end of the test time, the test voltage should be reduced to near zero, and then the capacitor's leads or terminals should be taken off the output of the withstanding voltage test equipment. If the test voltage is applied directly to the capacitor without raising it from near zero, surge voltage may occur and cause a defect.

\*ZERO CROSS is the point where voltage sine wave pass 0V.

- See the figure at right -

FAILURE TO FOLLOW THE ABOVE CAUTIONS MAY RESULT, WORST CASE, IN A SHORT CIRCUIT AND CAUSE FUMING OR PARTIAL DISPERSION WHEN THE PRODUCT IS USED.

Failure of a capacitor may result in a short circuit. Be sure to provide an appropriate fail-safe function such as a fuse

## **A**Caution

during use.

- Caution (Soldering and Mounting)
- 1. Vibration and Impact Do not expose a capacitor to excessive shock or vibration
- Circuit Board Material It is possible for the chip to crack by the expansion and shrinkage of a metal board. Please contact us if you want to use our ceramic capacitors on a metal board such as Aluminum.

#### 3. Land Layout for Cropping PC Board

### 

Continued from the preceding page.

- 4. Reflow Soldering
- When sudden heat is given to the components, the mechanical strength of the components should go down because remarkable temperature change causes deformity of components inside. In order to prevent mechanical damage in the components, preheating should be required for both of the components and the PCB board. Preheating conditions are shown in Table 1. It is required to keep temperature differential between the soldering and the components surface ( $\Delta T$ ) as small as possible.
- Solderability of Tin plating termination chip might be deteriorated when low temperature soldering profile where peak solder temperature is below the Tin melting point is used. Please confirm the solderability of Tin plating termination chip before use.
- When components are immersed in solvent after mounting, be sure to maintain the temperature difference  $(\Delta T)$  between the component and solvent within the range shown in the Table 1.

#### Table 1

| Part Number     | Temperature Differential |
|-----------------|--------------------------|
| G18/21/31       | ∆T≦190℃                  |
| G32/42/43/52/55 | ∆T≦130℃                  |

#### **Recommended Conditions**

|                  | Pb-Sn S         | Lead Free Solder |           |
|------------------|-----------------|------------------|-----------|

Pb-Sn Solder: Sn-37Pb

Lead Free Solder: Sn-3.0Ag-0.5Cu

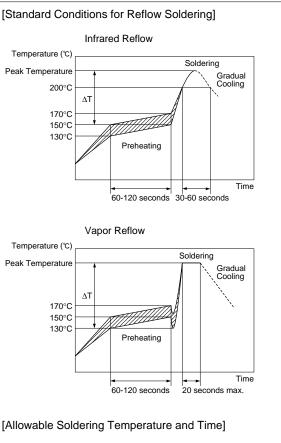

Optimum Solder Amount for Reflow Soldering

- Overly thick application of solder paste results in excessive fillet height solder. This makes the chip more susceptible to mechanical and thermal stress on the board and may cause cracked
- Too little solder paste results in a lack of adhesive strength on the outer electrode, which may result in chips breaking loose from the PCB.
- Make sure the solder has been applied smoothly to the end surface to a height of 0.2mm min.

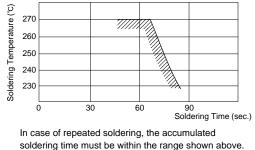

#### Inverting the PCB

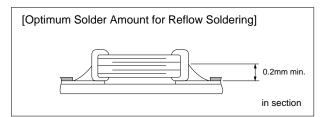

chips.

Make sure not to impose an abnormal mechanical shock on the PCB.

#### [Allowable Soldering Temperature and Time]

## **Caution**

 $\Box$  Continued from the preceding page.

- 5. Flow Soldering
- When sudden heat is given to the components, the mechanical strength of the components should go down because remarkable temperature change causes deformity of components inside. And an excessively long soldering time or high soldering temperature results in leaching by the outer electrodes, causing poor adhesion or a reduction in capacitance value due to loss of contact between electrodes and end termination.
- In order to prevent mechanical damage in the components, preheating should be required for both of the components and the PCB board. Preheating conditions are shown in Table 2. It is required to keep temperature differential between the soldering and the components surface (ΔT) as small as possible.
- When components are immersed in solvent after mounting, be sure to maintain the temperature difference between the component and solvent within the range shown in Table 2.

Do not apply flow soldering to chips not listed in Table 2.

#### Table 2

| Part Number | Temperature Differential |
|-------------|--------------------------|
| G□□18/21/31 | ∆T≦150℃                  |

#### **Recommended Conditions**

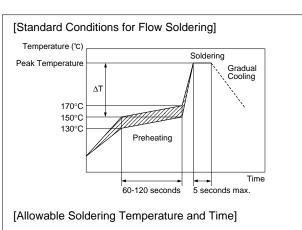

|                  | Pb-Sn Solder | Lead Free Solder |
|------------------|--------------|------------------|
| Peak Temperature | 240-250°C    | 250-260°C        |
| Atmosphere       | Air          | N2               |

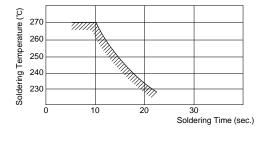

Pb-Sn Solder: Sn-37Pb

Lead Free Solder: Sn-3.0Ag-0.5Cu

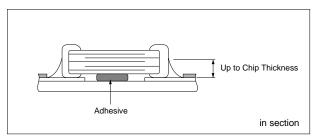

Optimum Solder Amount for Flow Soldering

The top of the solder fillet should be lower than the thickness of components. If the solder amount is excessively big, the risk of cracking is higher during board bending or under any other stressful conditions.

Continued on the following page.

Continued from the preceding page.

6. Correction with a Soldering Iron

 When sudden heat is applied to the components by use of a soldering iron, the mechanical strength of the components will go down because the extreme temperature change causes deformations inside the components.

In order to prevent mechanical damage to the components, preheating is required for both the components and the PCB board.

Preheating conditions, (The "Temperature of the Soldering Iron Tip", "Preheating Temperature",

"Temperature Differential" between iron tip and the

#### Table 3

| Part Number         | Temperature<br>of Soldering<br>Iron tip | Preheating<br>Temperature | Temperature<br>Differential<br>(∆T) | Atmosphere |
|---------------------|---|---------------------------|-------------------------------------|------------|
| G18/21/31           | 350°C max.                              | 150°C min.                | ∆T≦190℃                             | air        |
| G32/42/43/<br>52/55 | 280°C max.                              | 150°C min.                | ∆T≦130℃                             | air        |

\*Applicable for both Pb-Sn and Lead Free Solder.

Pb-Sn Solder: Sn-37Pb

Lead Free Solder: Sn-3.0Ag-0.5Cu

 Optimum Solder Amount when re-working Using a Soldering Iron

In case of smaller sizes than  $G\square\square 18$ , the top of the solder fillet should be lower than 2/3's of the thickness of the component or 0.5mm whichever is smaller.

In case of larger sizes than  $G\square\square 21$ , the top of the solder fillet should be lower than 2/3's of the thickness of the component.

If the solder amount is excessive, the risk of cracking is higher during board bending or under any other stressful conditions.

A Soldering iron ø3mm or smaller should be used. It is also necessary to keep the soldering iron from touching the components during the re-work. Solder wire with ø0.5mm or smaller is required for soldering.

### 7. Washing

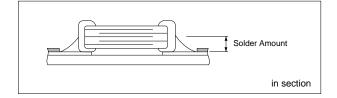

Excessive output of ultrasonic oscillation during cleaning causes PCBs to resonate, resulting in cracked chips or broken solder. Take note not to vibrate PCBs.

FAILURE TO FOLLOW THE ABOVE CAUTIONS MAY RESULT, WORST CASE, IN A SHORT CIRCUIT AND FUMING WHEN THE PRODUCT IS USED. components and the PCB), should be within the conditions of table 3.

It is required to keep the temperature differential between the soldering Iron and the components surface ( $\Delta$ T) as small as possible.

After soldering, do not allow the component/PCB to cool down rapidly.

The operating time for the re-working should be as short as possible. When re-working time is too long, it may cause solder leaching, and that will cause a reduction of the adhesive strength of the terminations.

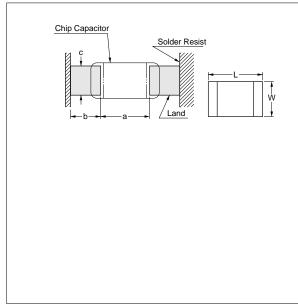

## Notice

## Notice (Soldering and Mounting)

 Construction of Board Pattern After installing chips, if solder is excessively applied to the circuit board, mechanical stress will cause destruction

resistance characteristics to lower. To prevent this, be extremely careful in determining shape and dimension before designing the circuit board diagram.

#### Construction and Dimensions of Pattern (Example)

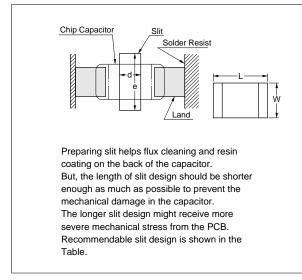

| Flow Solder | ing     |         |         |
|-------------|---------|---------|---------|

Notice

#### Continued from the preceding page.

### Land Layout to Prevent Excessive Solder

- 2. Mounting of Chips
- Thickness of adhesives applied

Keep thickness of adhesives applied ( $50-105\mu$ m or more) to reinforce the adhesive contact considering the thickness of the termination or capacitor ( $20-70\mu$ m) and the land pattern ( $30-35\mu$ m).

 Mechanical shock of the chip placer
 When the positioning claws and pick-up nozzle are worn, the load is applied to the chip while positioning is concentrated in one position, thus causing cracks, breakage, faulty positioning accuracy, etc.
 Careful checking and maintenance are necessary to prevent unexpected trouble.

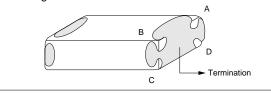

An excessively low bottom dead point of the suction nozzle imposes great force on the chip during mounting, causing cracked chips. Please set the suction nozzle's bottom dead point on the upper surface of the board.

#### 3. Soldering

(1) Limit of losing effective area of the terminations and conditions needed for soldering.

Depending on the conditions of the soldering temperature and/or immersion (melting time), effective areas may be lost in some part of the terminations.

To prevent this, be careful in soldering so that any possible loss of the effective area on the terminations will securely remain at a maximum of 25% on all edge length A-B-C-D-A of part with A, B, C, D, shown in the Figure below.

- (2) Flux Application
- An excessive amount of flux generates a large quantity of flux gas, causing deteriorated solderability. So apply flux thinly and evenly throughout. (A foaming system is generally used for flow soldering.)
- Flux containing too high percentage of halide may cause corrosion of the outer electrodes unless sufficient cleaning. Use flux with a halide content of 0.2% max.
- Do not use strong acidic flux.
- Do not use water-soluble flux\*.
   (\*Water-soluble flux can be defined as non rosin type flux including wash-type flux and non-wash-type flux.)

## Notice

Continued from the preceding page.

4. Cleaning

Please confirm there is no problem in the reliability of the product beforehand when cleaning it with the intended equipment.

The residue after cleaning it might cause the decrease in the surface resistance of the chip and the corrosion of the electrode part, etc. As a result it might cause reliability to deteriorate. Please confirm beforehand that there is no problem with the intended equipment in ultrasonic cleansing.

### 5. Resin Coating

Please use it after confirming there is no influence on the product with a intended equipment beforehand when the resin coating and molding.

A cracked chip might be caused at the cooling/heating cycle by the amount of resin spreading and/or bias thickness.

The resin for coating and molding must be selected as the stress is small when stiffening and the hygroscopic is low as possible.

## Rating

- 1. Capacitance change of capacitor
- (1) In case of X7R char.

Capacitors have an aging characteristic, whereby the capacitor continually decreases its capacitance slightly if the capacitor is left on for a long time. Moreover, capacitance might change greatly depending on the surrounding temperature or an applied voltage. So, it is not likely to be suitable for use in a time constant circuit. Please contact us if you need detailed information.

(2) In case of any char. except X7R
 Capacitance might change a little depending on the surrounding temperature or an applied voltage.
 Please contact us if you intend to use this product in a strict time constant circuit.

 Performance check by equipment Before using a capacitor, check that there is no problem in the equipment's performance and the

specifications. Generally speaking, CLASS 2 (X7R char.) ceramic capacitors have voltage dependence characteristics and temperature dependence characteristics in capacitance. So, the capacitance value may change depending on the operating condition in the equipment. Therefore, be sure to confirm the apparatus performance of receiving influence in a capacitance value change of a capacitor, such as leakage current and noise suppression characteristics. Moreover, check the surge-proof ability of a capacitor in the equipment, if needed, because the surge voltage may exceed specific value by the inductance of the circuit.

**ISO 9001 Certifications** 

## Qualified Standards

The products listed here have been produced by ISO 9001 certified factory.

| Plant                                    |

#### **∆Note:**

- 1. Export Control
- <For customers outside Japan>

No Murata products should be used or sold, through any channels, for use in the design, development, production, utilization, maintenance or operation of, or otherwise contribution to (1) any weapons (Weapons of Mass Destruction [nuclear, chemical or biological weapons or missiles] or conventional weapons) or (2) goods or systems specially designed or intended for military end-use or utilization by military end-users. <For customers in Japan>

For products which are controlled items subject to the "Foreign Exchange and Foreign Trade Law" of Japan, the export license specified by the law is required for export.

- 2. Please contact our sales representatives or product engineers before using the products in this catalog for the applications listed below, which require especially high reliability for the prevention of defects which might directly damage a third party's life, body or property, or when one of our products is intended for use in applications other than those specified in this catalog.
  - (1) Aircraft equipment
- ② Aerospace equipment
   ④ Power plant equipment
- ③ Undersea equipment
  ⑤ Medical equipment
- 6 Transportation equipment (vehicles, trains, ships, etc.)
- (8) Disaster prevention / crime prevention equipment
- Traffic signal equipment
   Data-processing equipment
  - equipment (D) Application of similar complexity and/or reliability requirements to the applications listed above
- 3. Product specifications in this catalog are as of Jul 2009. They are subject to change or our products in it may be discontinued without advance notice. Please check with our sales representatives or product engineers before ordering. If there are any questions, please contact our sales representatives or product engineers.
- 4. Please read rating and A CAUTION (for storage, operating, rating, soldering, mounting and handling) in this catalog to prevent smoking and/or burning, etc.
- 5. This catalog has only typical specifications because there is no space for detailed specifications. Therefore, please approve our product specifications or transact the approval sheet for product specifications before ordering.
- 6. Please note that unless otherwise specified, we shall assume no responsibility whatsoever for any conflict or dispute that may occur in connection with the effect of our and/or a third party's intellectual property rights and other related rights in consideration of your use of our products and/or information described or contained in our catalogs. In this connection, no representation shall be made to the effect that any third parties are authorized to use the rights mentioned above under licenses without our consent.
- 7. No ozone depleting substances (ODS) under the Montreal Protocol are used in our manufacturing process.
