

FOUR CHANNEL HD AUDIO CODEC

92HD75B
LOW POWER OPTIMIZED

Description

The 92HD75B is a low power optimized, high fidelity, 4-channel audio codec compatible with Intel's High Definition (HD) Audio Interface. The 92HD75B provides stereo 24-bit resolution with sample rates up to 192kHz. The 92HD75B provides high quality, HD Audio capability to notebook and business desktop PC applications.

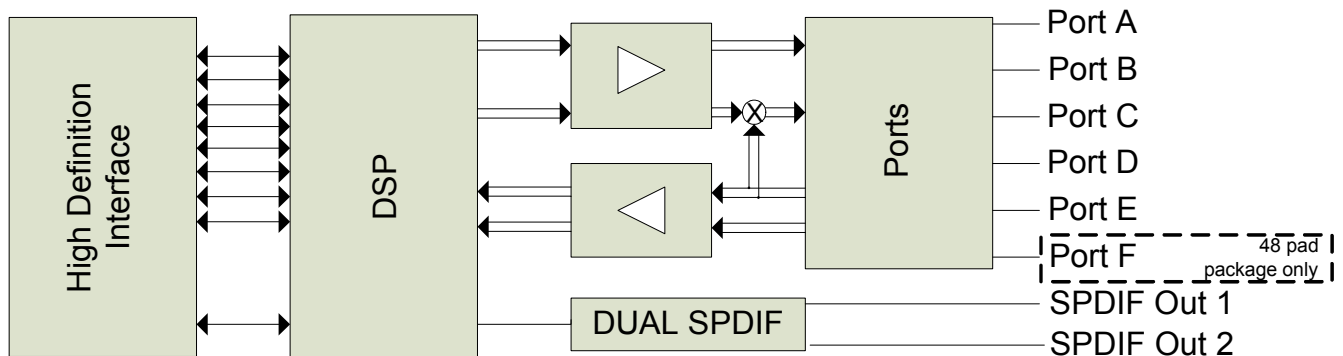

Features

- **4 Channels (2 stereo DACs and 2 stereo ADCs) with 24-bit resolution**
 - Supports full-duplex stereo audio and simultaneous VoIP
 - Provides a mono output
- **Microsoft WLP 3/4 premium logo compliant, as defined in WLP 3.09**
- **Optimized and flexible power management with pop/click mitigation**
- **Support for 1.5V and 3.3V HDA signaling**

- **Digital microphone inputs (mono or stereo*)**
- **High performance analog mixer**
- **2 or 3* adjustable VREF Out pins for microphone bias**
- **5 or 6* analog ports with port presence detect**
- **Two-pin volume up/down control**
- **Digital and Analog PC Beep to all outputs**
- **Integrated headphone amp**
- **Sample rates up to 192kHz**
- **+3.3 V, +4.75 V and +5 V analog power supply options**
- **3.3V digital power supply options**
- **32-pad and 48-pad QFN RoHS packages**

*dependant on package option

Software Support

- Intuitive graphical user interface that allows configurability and preference settings
- SKPI (Kernel Processing Interface)
 - Enables plug-ins that can operate globally on all audio streams of the system
- 12 band fully parametric equalizer (SKPI plug-in)
 - Constant, system-level effects tuned to optimize a particular platform can be combined with user-mode “presets” tailored for specific acoustical environments and applications
 - System-level effects automatically disabled when external audio connections made
- Dynamics Processing (SKPI plug-in)
 - Enables improved voice articulation
 - Compressor/limiter allows higher average noise level without resonances
- IDT Vista APO wrapper
 - Enables multiple APOs to be used with the IDT Driver
- Microphone Beam Forming, Acoustic Echo Cancellation, and Noise Suppression
- Dynamic Stream Switching
 - Improved multi-streaming user experience with less support calls
- Dolby PC Entertainment Experience Logo Program
 - Dolby Home Theater™ (HT)
 - Dolby Sound Room™ (SR)
- Dolby Technologies
 - Dolby Headphone™, Dolby Virtual Speaker™
 - Dolby ProLogic II™, Dolby ProLogic IIx™
 - Dolby Digital Live™ (DDL)
- Maxx Player™ from Waves
- WOW™ and Tru Surround™ from SRS

1. DESCRIPTION

1.1. Overview

The 92HD75B is a high fidelity, 4-channel audio codec compatible with the Intel High Definition (HD) Audio Interface. The 92HD75B codecs provide high quality, HD Audio capability to notebook and cost sensitive desktop PC applications.

The higher performance and quality of IDT's audio solutions brings consumer electronics level performance to notebook and desktop PCs. 92HD75B is designed to meet or exceed premium logo requirements for Microsoft's Windows Logo Program (WLP) 3.09 and revisions 4 as indicated in WLP 3.09.

The 92HD75B provides stereo 24-bit, full duplex resolution supporting sample rates up to 192kHz by the DAC and ADC. The 92HD75B SPDIF outputs support sample rates of 192kHz, 96kHz, 88.2kHz, 48kHz, and 44.1kHz. Additional sample rates are supported by the driver software.

The 92HD75B supports a wide range of mobile and desktop 4 channel configurations. The 2 independent SPDIF output interfaces provide connectivity to Consumer Electronic equipment like Dolby Digital decoders, powered speakers, mini disk drives or to a home entertainment system. Simultaneous WLP compliant HDMI and SPDIF output is possible. All analog input pairs support LINE_IN and MIC.

MIC inputs can be programmed with 0/10/20/30dB boost. (40dB boost is available using the IDT driver.) For more advanced configurations, the 92HD75B has up to 8 General Purpose I/O (GPIO).

The port presence detect capabilities allow the codecs to detect when audio devices are connected to the codec. The fully parametric IDT SoftEQ can be initiated or disabled upon headphone jack removal and insertion for protection of notebook speakers.

The 92HD75B operates with a 3.3V digital supply and either 3.3V, 4V, 4.75V or 5V analog supply. It can also work with 1.5V and 3.3V HDA signaling; the correct signalling level is selected dynamically based on the power supply voltage on the DVDD-IO pin in 48 pad package or as an orderable option with 32 pad packages.

Available in a 32-pad QFN or 48-pad QFN Environmental (ROHS) packages.

1.4. Detailed Description

1.4.1. Low-voltage High Definition Audio Link Signaling

The 92HD75B is compatible with either 1.5 V or 3.3 V High Definition Audio Link signaling; the voltage selection is performed dynamically based on the input voltage of DVDD_IO in 48 pad package. Note that DVDD_IO is not a logic configuration pin but provides the digital power supply to be used for the High Definition Audio Link signals. Different orderable part numbers are assigned. The 32 pad package does not have DVDD_IO so selection of 1.5V or 3.3V High Definition Audio Link signaling is by two different orderable parts. Please see the orderable part number section for more details.

When in 1.5 V mode, the 92HD75B can correctly decode BITCLK, SYNC, RESET# and SDO because they operate at 1.5 V. Additionally, it will drive SDI_CODEC at 1.5 V. None of the GPIOs are affected, as they always function at their nominal voltage (DVDD or AVDD).

1.4.2. Port Functionality

Single function (Input only / output only) ports allow for the highest possible performance.

- Port A supports
 - Headphone Out
 - Line Out
- Ports B and C support
 - Line In
 - Mic with 0/10/20/30/40 dB boost
- Port D supports
 - Line Out
- Port E supports
 - Line In
 - Mic with 0/10/20/30/40 dB boost
- Port F supports (48 version only)
 - Line Out

Note⁴: 40dB boost requires using the IDT driver. When the 40dB mic boost feature is enabled, additional gain increases greater than 6dB may result in significant audio quality degradation of the microphone audio input. In particular, when the 40dB MIC boost is active, the SNR, THD+N and DC offset will significantly degrade regardless of the input signal level.

1.4.3. Port Characteristics

Ports are designed to be dedicated inputs or outputs only. Universal (Bi-directional) jacks are not supported. Port A is designed to drive a set of 32 ohm (nominal) headphones or a 10K (nominal) load with on board shunt resistance as low as 20K ohms (typical - used to maintain coupling CAP bias.) Line Level outputs are intended to drive an external 10K speaker load (nominal) and an on board shunt resistor of 20-47K (nominal). However, applications may support load impedances of 5K ohms and above. Input ports are 47K impedance (nominal) at the pin.

DAC full scale outputs and intended full scale input levels are 1V rms. Line output ports and Head-on output ports on the 92HD75B may be configured for +3dBV full scale output levels by using a vendor specific verb.

Output ports are always on to prevent pops/clicks associated with charging and discharging output coupling capacitors. This maintains proper bias on output coupling caps even in D3 as long as AVDD is available. Unused ports should be left unconnected. When updating existing designs to use 92HD75B, ensure that there are no conflicts between the output ports on 92HD75B and existing circuitry.

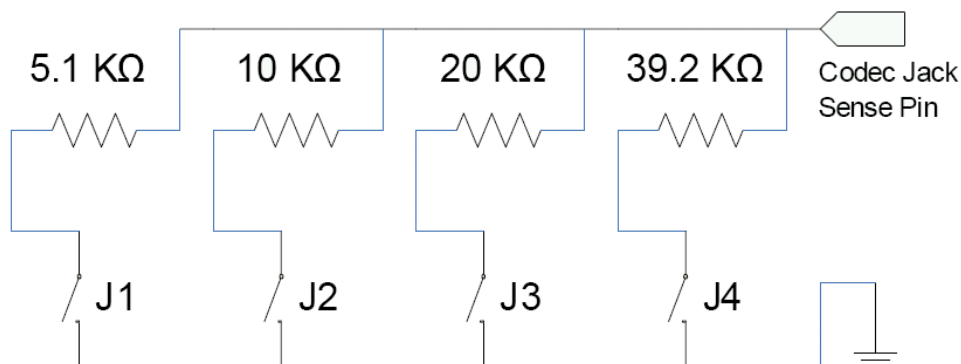

Table 1. Analog Output Port Behavior

AFG Power State	Output Enable	Mute	Port Behavior
D0-D2	1	0	Active - audio enabled
	1	1	Active - audio mute. Port drives silence
	0	-	Inactive -port is powered on (low output impedance) but drives silence only.
D3	-	-	Inactive (lower power) - Port keeps output coupling caps charged and has low output impedance (not necessarily the same as in D0) but consumes less power.

1.4.4. Jack Detect

Plugs inserted to a jack on Ports A, B, C, & D are detected using SENSE_A. Plugs inserted to a jack on Ports E & F are detected using SENSE_B. The following figure shows external components. All external resistors are 1%, pull up is 2.5KΩ.

Figure 3. Jack Detect

See reference design for more information on Jack Detect implementation.

1.4.5. SPDIF Output

All SPDIF Outputs can operate at 44.1kHz, 48kHz, 88.2kHz, 96kHz and 192kHz as defined in the Intel High Definition Audio Specification with resolutions up to 24 bits. This insures compatibility with

all consumer audio gear and allows for convenient integration into home theater systems and media center PCs.

A second independant SPDIF Output is provided as an option for WLP compliant HDMI and SPDIF outputs. Its function is identical to the primary SPDIF output.

Table 2. SPDIF OUT 0 (Pin 48) Behavior

	De-Asserted (High)	Disabled	Enabled	Enabled	1-15	Active - Pin drives SPDIFOut1 data (internal pull-down enabled)

1.4.6. **Mono Output**

The MONO Output has an independent mute (see the Widget listing for details). The MONO Output derives its input from the output of the summing node after the mono mux. The following sources are available for the mono pin:

- DAC0 Output: When enabled (by using port connection list), both DAC0 Outputs are summed together.
- DAC1 Output: When enabled (by using port connection list), both DAC1 Outputs are summed together.
- Input Mixer: When enabled (by using mono mix connection list and DAC mixer), both mixer outputs are summed together.

The stereo inputs are scaled by -6dB and then summed to provide an output that is the average of the two inputs. The full scale output at mono out is designed to be about 0dBV. It is not possible to adjust to a +3dBV output level.

Mono out and Analog PC Beep share a pin. If legacy Analog PC Beep input and mono out are required, Port E can be used as an optional Analog PC Beep Input.

1.4.7. **Input Multiplexers**

92HD75B implements 2 port input multiplexers. These multiplexers incorporate the microphone boost function (0, 10dB, 20dB, 30dB, and 40dB gain) as an output amp and allow a preselection of one of three possible inputs:

- Port B
- Port C
- Port E

NOTE: Changing the Input multiplexer setting will affect the ADC. This may present a negative user experience and must be exposed carefully to prevent problems. 40dB boost is implemented but the only 0-30dB gain steps are reported.

1.4.8. **ADC Multiplexers**

92HD75B implements 2 ADC input multiplexers. These multiplexers incorporate the ADC record gain function (0 to +22.5dB gain in 1.5dB steps) as an output amp and allow a preselection of one of four possible inputs:

- DMIC 0
- DMIC1 (48QFN package only)
- InPortMux (ADC0 selects inport0_mux / ADC1 selects inport1_mux)
- Mixer output

1.4.9. **Power Management**

The following table describes what functionality is active in each power state

The D3-default state is available for HD Audio compliance. The programmable values, exposed via vendor-specific settings, are under the IDT Device Driver control for further power reduction.

The default power state for the Audio Function Group after reset is D3-default..

1.No DAC or ADC streams are active. Analog mixing and loop thru are supported.

2.VAG is kept active when ports are disabled or in D2/D3. Ports A, D, F and mono may be powered down using vendor specific verbs.

3.VAG is always ramped up and down gradually, except in the case of a sudden power removal. VAG is active in D2/D3 but in a low power state.

4. BITCLK must be active and both AVDD and DVDD must be available for Port Sense to operate.

5.Vendor specific bit for Ref Top controls VAG generator, Bandgap Reference, and Reference bias generator. Place part into D3 and power down all ports (using vendor specific verbs) before powering down Ref Top.

6.Not active if BITCLK is not running (Controller in D3).

1.4.10. Multi-channel capture

The capability to assign multiple “ADC Converters” to the same stream is supported to meet the microphone array requirements of Vista and future operating systems. Single converter streams are still supported and is done by assigning unique non zero Stream IDs to each converter. All capture devices (ADCs 0 and 1) must be used to create a multi-channel input stream. There are no restrictions regarding digital microphones.

The ADC Converters can be associated with a single stream as long the sample rate and the bits per sample are the same. The assignment of converter to channel is done using the “CnvtrID” widget and is restricted to even values. The ADC converters will always put out a stereo sample and therefore require 2 channels per converter.

The stream will not be generated unless all entries for the targeted converters are set identically, and the total number of assigned converter channels matches the value in the NmbrChan field. These are listed the “Multi-Converter Stream Critical Entries.” table.

An example of a 4 Channel Steam with ADC0 supplying channels 0&1 and ADC1 supplying channels 2 & 3 is shown below. A 4 Channel stream can be created by assigning the same non-zero stream id “Strm= N” to both ADC0 and ADC1. The sample rates must be set the same and the number of channels must be set to 4 channels “NmbrChan = 0011”.

Table 5: Example channel mapping

	[3:0]	Ch = 2
ADC0 CnvtrID	(NID = 0x07)	
	[3:0]	Ch=0

Figure 4. Multi-channel capture

The following figure describes the bus waveform for a 24-bit, 48KHz capture stream with ID set to 1.

Figure 5. Multi-channel timing diagram

1.4.11. EAPD

The EAPD pin (pin 47) also supports SPDIF and GPIO functions. The pin defaults to EAPD after power on reset and will remain in EAPD mode until either GPIO is enabled for pin 47 or the port I/O is enabled to support SPDIF. The EAPD value is reflected on the EAPD pin; a 1 causes the external amplifier to power up, and a 0 causes it to power down. When the EAPD value = 1, the EAPD pin must be placed in a state appropriate to the current power state of the associated Pin Widget even though the EAPD value may remain 1. The default state of this pin is 0 (driving low) and a Pull-down prevents the line from floating high when the part is in reset.

Table 6. EAPD Behavior

AFG Power State	RESET#	GPIO Enable	Output Enable	EAPD Power State	Pin Behavior
D0-D3	Asserted (Low)	-	-	-	Hi-Z (internal pull-down enabled) immediately after power on, otherwise the previous state is retained until the rising edge of RESET#
	De-Asserted (High)	Enabled	-	-	Active - Pin reflects GPIO0 configuration (internal pull-up enabled)
	De-Asserted (High)	Disabled	Enabled	-	Active - Pin Drives SPDIFOut0/1 output (internal pull-down enabled)
	De-Asserted (High)	Disabled	Disabled	D2-D3	Hi-Z (internal pull-down enabled)
	De-Asserted (High)	Disabled	Disabled	D0-D1	Active - Pin drives the value of the EAPD bit (internal pull-down enabled)

1.4.12. Digital Microphone Support

The digital microphone interface permits connection of a digital microphone(s) to the CODEC via the DMIC0, DMIC1 (48QFN package only), and DMIC_CLK 3-pin interface. The DMIC0 and DMIC1 signals are inputs that carry individual channels of digital Mic data to the ADC. In the event that a single microphone is used, the data is ported to both ADC channels.

The DMIC_CLK output is controllable from 4.704Mhz, 3.528Mhz, 2.352Mhz, 1.176Mhz and is synchronous to the 24Mhz internal clock. The default frequency is 2.352Mhz.

92HD75B supports the following digital microphone configurations:

Table 7. Valid Digital Mic Configurations

Digital Mics	Data Sample	ADC Conn.	Notes
0	N/A	N/A	No Digital Microphones
1	Single Edge	0, or 1	Available on either DMIC_0 or DMIC_1 Both ADC Channels produce data, may be in phase or out by 1/2 DMIC_CLK period depending upon external configuration and timing
2	Double Edge on either DMIC_0 or 1 OR Single Edge on DMIC_0 and 1	0, or 1	Available on either DMIC_0 or DMIC_1, External logic required to support sampling on a single Digital Mic pin channel on rising edge and second Digital Mic right channel on falling edge of DMIC_CLK for those digital microphones that don't support alternative clock edge capability. If both DMIC_0 and DMIC_1 are used to support 2 digital microphones, 2 separate ADC units will be used, however, this configuration is not recommended since it consumes two stereo ADC resources.
3	Double Edge on one DMIC pin and Single Edge on the second DMIC pin.	0, or 1	Requires both DMIC_0 AND DMIC_1, External logic required to support sampling on a single Digital Mic pin channel on rising edge and second Digital Mic right channel on falling edge of DMIC_CLK for those digital microphones that don't support alternative clock edge capability. Two ADC units are required to support this configuration
4	Double Edge	0, or 1	Connected to DMIC_0 and DMIC_1, External logic required to support sampling on a single Digital Mic pin channel on rising edge and second Digital Mic right channel on falling edge of DMIC_CLK for those digital microphones that don't support alternative clock edge capability. Two ADC units are required to support this configuration

1.4.13. Analog PC-Beep

92HD75B does not support automatic routing of the PC_Beep pin to all outputs when the link is in reset. Analog PC_BEEP is supported using a vendor specific verb.

Mono out and Analog PC Beep share a pin. If legacy Analog PC Beep input and mono out are required, Port E can be used as an optional Analog PC Beep Input.

1.4.14. Headphone Drivers

This product implements a +3dBV output option on headphone capable ports. (HP output and line output levels are defined as 1V_{rms} with an option to enable +3dBV FSOV using a vendor specific verb.)

1.Default condition.

1.4.15.2. Volume/Digital Microphone/GPIO Selection

To determine which function is actually enabled on pins2 and 4, the order of precedence is followed:

- 1) If the GPIOs are enabled, they override both Volume Control and Digital Mics
- 2) If the GPIOs are not enabled through the AFG, then at reset, the Volume control is enabled with the weak pull-up.
- 3) If BIOS or other software application enables either Digital Microphones inputs through the Configuration Default Register, the Volume is disconnected and the pull-ups are disconnected with the weak pull-downs enabled.

1.4.15.3. VRefOut/GPIO Selection

Two functions are available on pin 31. To determine which function is actually enabled, the order of precedence is followed:

- 1) If the GPIO4 function is enabled, it overrides VRefOut-E
- 2) If the GPIO4 function is not enabled through the AFG, then, at reset the VrefOut-E is enabled.
- 3) If using pin 31 as GPIO, make sure to incorporate a 10K ohm external pull-up to AVDD to prevent the pin from floating in GPI mode and to allow proper operation in open-drain GPO mode.

1.4.16. External Volume Control (48 pad package only)

92HD75B incorporates a 2-pin volume control interface. Volume up, down, and mute functions are easily implemented using 2 push-button switches. The CODEC provides internal pull-up resistors simplifying external CODEC circuitry. Also, repeat and direct modes of operation add flexibility to the interface. The typical usage model is for front panel master volume buttons on an entertainment PC, or case mounted hardware volume control for mobile platforms.

The external volume control is not available in the 32 pad package.

1.4.16.1. Theory of Operation

The codec monitors the volume up/down inputs for a change of state from high to low, and waits for the inputs to settle. If the inputs have not settled by the end of the de-bounce period, then the value at the end of the period is used. A 0 (low voltage) on the Down pin will decrement the volume register, while a 0 on the Up pin will increment the volume register. If both inputs are 0 at the same time, then the volume register will be set to its lowest value (mute). Pressing Up, Down, or both buttons at the same time when the volume control interface is in mute mode, will cause the part to un-mute.

The de-bounce / repeat rate is selectable from 2.5Hz to 20Hz in 2.5Hz increments using the Volume Knob VCSR0 verb (FE0) Rate bits (bits 2:0). This value is used for both de-bounce and repeat rates. The de-bounce period is the time that the CODEC waits for the inputs to settle, and the repeat rate is the rate at which the CODEC will increment/decrement the volume if a volume button is pushed and held. When a falling edge is detected on either one of the volume control pins, the codec will wait for (1/Rate) seconds for the input to settle. If the Continuous bit is set in the Volume Knob VCSR0 verb (bit 3), then the codec will wait for the de-bounce period to expire then repeatedly increment or decrement the volume register at the rate specified in the Rate bits until the button is released.

1.4.16.2. Modes of Operation

- DIRECT MODE
 - In Direct mode, the Volume Knob widget directly controls the volume of all of the DACs in the part. The volume in the Volume Knob widget acts as the master volume and limits the maximum volume for each of the DAC amplifiers. The amp gain for each of the DACs can also be adjusted using the DAC amplifiers. However, the actual gain for an individual DAC will be the sum of the Volume Knob volume and the DAC amplifier volume. For example, if the DAC amplifier gain is set to 0x7F (0dB) and the Volume Knob volume is set to 0x3F (-48dB) the resulting gain would be -48dB. If the combination of gains is less than -95.25dB (the equivalent to a value of 0x0 for the DAC or Volume Knob volume settings) then the

actual gain will be -95.25dB. For example, if the Volume Knob is set to 0x3F (-48dB) and the DAC amplifier volume is set to 0x1F (-72dB) then the DAC volume will be set to -95.25dB.

- Direct mode is enabled by setting bit 7 in the Volume Knob Cntrl verb (F0F). The volume is reflected in the Volume Knob Cntrl bits 6:0 and the step size is 0.75dB. In direct mode, software can read or write the volume in the Volume Knob widget.
- **INDIRECT MODE**
 - In indirect mode, the Volume Knob widget does not directly control the DAC amplifier gains. An event on the volume Up/Down pins will increment/decrement the value in the Volume Knob Cntrl verb (F0F) volume bits (bits 6:0) just as in Direct mode. However, instead of adjusting the DAC amplifier gain, an unsolicited response is generated (if enabled) and the control software must read the volume in the Volume Knob widget and take appropriate action. Indirect mode is particularly useful when it is undesirable to control all of the DAC amplifier volumes at the same time, or when implementing ADC volume control.
 - In indirect mode, there are only 128 volume levels in the Volume Knob Cntrl volume bits, the value will not go beyond the lower and upper limits (0x0 or 0x7F), and an unsolicited response will not be generated if an input event tries to go beyond these limits. Therefore, it is the responsibility of the controlling software to monitor the volume in the Volume Knob Widget and take appropriate action.
 - Indirect mode is enabled by clearing bit 7 in the Volume Knob Cntrl verb (F0F). The volume is reflected in the Volume Knob Cntrl bits 6:0 and the step size is 0.75dB. In direct mode, software can read or write the volume in the Volume Knob widget.

1.4.16.3. Hardware Implementation

The Volume Knob interface is comprised of two input pins, CODEC pins 2 and 4. Both pins have internal pull-up resistors, so only two push button switches are required for most implementations. Typically, a series resistor and shunt capacitor are used to help reduce noise and prevent damage from ESD and other potential faults. An example circuit is shown below.

2.1. Electrical Specifications

2.1.1. Absolute Maximum Ratings

Stresses above the ratings listed below can cause permanent damage to the 92HD75B. These ratings, which are standard values for IDT commercially rated parts, are stress ratings only. Functional operation of the device at these or any other conditions above those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods can affect product reliability. Electrical parameters are guaranteed only over the recommended operating temperature range.

Table 10. Electrical Specification: Maximum Ratings

ESD: The 92HD75B is an ESD (electrostatic discharge) sensitive device. The human body and test equipment can accumulate and discharge electrostatic charges up to 4000 Volts without detection. Even though the 92HD75B implements internal ESD protection circuitry, proper ESD precautions should be followed to avoid damaging the functionality or performance.

1. Dynamic Range is the ratio of the full scale signal to the noise output with a -60dBFS signal as defined in AES17 as SNR in the presence of signal and outlined in AES6id, measured "A weighted" over 20 Hz to 20 kHz bandwidth.
2. Ratio of Full Scale signal to idle channel noise output is measured "A weighted" over a 20 Hz to a 20 kHz bandwidth. (AES17-1991 Idle Channel Noise or EIAJ CP-307 Signal-to-noise Ratio).
3. THD+N ratio as defined in AES17 and outlined in AES6id, non-weighted, over 20 Hz to 20 kHz bandwidth. Results at the jack are dependent on external components and will likely be 1 - 2dB worse.
4. Peak-to-Peak Ripple over Passband meets ± 0.125 dB limits, 48 kHz or 44.1 kHz Sample Frequency. 1dB limit.
5. Stop Band rejection determines filter requirements. Out-of-Band rejection determines audible noise.
6. The integrated Out-of-Band noise generated by the DAC process, during normal PCM audio playback, over a bandwidth 28.8 to 100 kHz, with respect to a 1 Vrms DAC output.
7. In series with 5 Ω . Maximum output capacitance is reduced to 220pF if a single pole 30kHz filter is added to attenuate conversion noise.
8. Gain drift is the change in analog volume control gain for each step across the supported 0 °C TO 70 °C temperature range referenced to the 25 °C gain value and specified in ppm per °C
9. ± 1 dB limits for Line Output & 0 dB gain, at -20dBV
10. Spurious tone rejection is tested with ADC dither enabled and compared to ADC performance without dither.
11. Everything enabled and active. Does not include 32 Ω load headphone power.
12. Idle measurement D3 set for minimum clicks/pops (biases and min. amps. on)
13. All GPIO and Digital microphone pins.
14. VDD is AVDD1 for GPIO5-7 and DVDD_CORE for others.
15. Can be set to 0.5 or 0.8 AVdd.

6. PIN CONFIGURATION DEFAULT REGISTER SETTINGS

The configuration default registers are 32-bit registers required for each pin widget. These registers are normally used by the CODEC driver to determine the configuration of jacks and devices attached to the CODEC. When the CODEC is powered on, these registers are loaded with the default values provided by IDT for typical system usage, and are loaded in a way that is compatible with the Microsoft Universal Audio Architecture (UAA) driver. The values can be overridden by IDT customers according to their system configuration. Table 14 shows the Pin Widget Configuration Default settings.

There are two types of responses: Solicited and Unsolicited. Solicited responses are provided as a direct response to an issued command and will be provided in the frame immediately following the command. Unsolicited responses are provided by the CODEC independent of any command. Unsolicited responses are the result of CODEC events such as a jack insertion detection. The formats for Solicited Responses and Unsolicited Responses are shown in Tables 17 and 18 respectively. The “Tag” field in bits [31:28] of the Unsolicited Response identify the event.

[7.:0]	Divider	RW	00	Enable internal PC-Beep generation. Divider == 00h disables internal PC Beep generation and enables normal operation of the codec. Divider != 00h generates the beep tone on all Pin Complexes that are currently configured as outputs. The HD Audio spec states that the beep tone frequency = (48kHz HD Audio SYNC rate) / (4*Divider), producing tones from 47 Hz to 12 kHz (logarithmic scale). This part can selectively generate tones with frequency = 48KHz * (257 - Divider) / 1024, yielding a linear range from 12kHz to 93.75Hz in steps of 46.875Hz. If the FreqShift bit is set, then the beep tones generated have frequency = 48KHz * (513 - Divider) / 1024, yielding a range of 24kHz to 12093.75Hz in steps of 46.875Hz.

Bit	Bitfield Name	RW	Reset	Description
[31..2]	Rsvd1	R	00000000	Reserved.
[1]	FreqShift	RW	0	Digital PCBeep frequency range shift (for linear mode only): 0 = 47Hz-12kHz, 1 = 12.047kHz-24kHz.
[0]	LinearSel	RW	0	Linear PCBeep frequency select. 0 = HD Audio Rev.1.0 frequencies ; 1 = linear frequencies

8.32. VolumeKnob Node (NID = 27)**8.32.1. VolumeKnob WCap**

	Verb ID	Payload	Response
Get	F00	09	See bitfield table.

8.32.1.1. VolumeKnob WCap

Bit	Bitfield Name	RW	Reset	Description
[31..24]	Rsvd2	R	00	Reserved.
[23..20]	Type	R	6	Widget type: 0h = Out Converter; 1h = In Converter; 2h = Summing (Mixer); 3h = Selector (Mux); 4h = Pin Complex; 5h = Power; 6h = Volume Knob; 7h = Beep Generator; 8h-Eh = Reserved; Fh = Vendor Defined
[19..0]	Rsvd1	R	0	Reserved.

8.32.2. VolumeKnob VolKnobCap

	Verb ID	Payload	Response
Get	F00	13	See bitfield table.

8.32.2.1. VolumeKnob VolKnobCap

Bit	Bitfield Name	RW	Reset	Description
[31..8]	Rsvd	R	000000	Reserved.
[7]	Delta	R	1	Indicates if software can write a base volume to the Volume Control Knob.
[6..0]	NumSteps	R	7F	Number of gains steps (number of possible settings - 1).

8.32.3. VolumeKnob ConLst

	Verb ID	Payload	Response
Get	F00	0E	See bitfield table.

8.32.3.1. VolumeKnob ConLst

Bit	Bitfield Name	RW	Reset	Description
[31..8]	Rsvd	R	000000	Reserved.
[7]	LForm	R	0	Connection list format: 1 = long-form (15-bit) NID entries, 0 = short-form (7-bit) NID entries.
[6..0]	ConL	R	02	Number of NID entries in connection list.

8.32.4. VolumeKnob ConLstEntry0

	Verb ID	Payload	Response
Get	F02	00	See bitfield table.

8.32.4.1. VolumeKnob ConLstEntry0

Bit	Bitfield Name	RW	Reset	Description
[31..24]	ConL3	R	00	Unused list entry.
[23..16]	ConL2	R	00	Unused list entry.
[15..8]	ConL1	R	11	DAC1 Converter widget (0x11)
[7..0]	ConL0	R	10	DAC0 Converter widget (0x10)

8.32.5. VolumeKnob UnsolResp

	Verb ID	Payload	Response
Get	F08	00	See bitfield table.

8.32.5.1. VolumeKnob UnsolResp

Bit	Bitfield Name	RW	Reset	Description
[31..8]	Rsvd2	R	000000	Reserved.
[7]	En	RW	0	Unsolicited response enable: 1 = enabled, 0 = disabled.
[6]	Rsvd1	R	0	Reserved.
[5..0]	Tag	RW	00	Software programmable field returned in top six bits (31:26) of every Unsolicit- ed Response generated by this node.

8.32.6. VolumeKnob Cntrl

	Verb ID	Payload	Response
Get	F0F	00	See bitfield table.

8.32.6.1. VolumeKnob Cntrl

Bit	Bitfield Name	RW	Reset	Description
[31..8]	Rsvd	R	000000	Reserved.
[7]	Direct	RW	0	Direct = 1 causes the volume control to directly control the hardware volume of the slave amps. Direct = 0 causes unsolicited responses to be generated.
[6..0]	Volume	RW	7F	Volume, specified in steps of amplifier gain

8.32.7. VolumeKnob Update

	Verb ID	Payload	Response
Get	FE0	00	See bitfield table.

8.32.7.1. VolumeKnob Update

Bit	Bitfield Name	RW	Reset	Description
[31..5]	Rsvd	R	0000000	Reserved.
[4]	Continuous	RW	1	Allow continuous incrementing/decrementing of the volume knob value.

8.32.7.1. *VolumeKnob Update*

Bit	Bitfield Name	RW	Reset	Description
[3..1]	Rate	RW	0	Volume knob update rate, for continuous mode and de-bouncing (0..7 = 2.5..20Hz, in increments of 2.5Hz)
[0]	Enable	RW	0	Volume knob Enable (0=pin used for digital microphone. 1=pin used for volume control)"

12. SOLDER REFLOW PROFILE

12.1. Standard Reflow Profile Data

Note: These devices can be hand soldered at 360 °C for 3 to 5 seconds.

FROM: IPC / JEDEC J-STD-020C "Moisture/Reflow Sensitivity Classification for Nonhermetic Solid State Surface Mount Devices" (www.jedec.org/download).

Table 20. Standard Reflow Profile

Profile Feature	Pb Free Assembly
Average Ramp-Up Rate ($T_{s_{max}} - T_p$)	3 °C / second max
Preheat: Temperature Min ($T_{s_{min}}$) Temperature Max ($T_{s_{max}}$) Time ($t_{s_{min}} - t_{s_{max}}$)	150 °C 200 °C 60 - 180 seconds
Time maintained above: Temperature (T_L) Time (t_L)	217 °C 60 - 150 seconds
Peak / Classification Temperature (T_p)	See "Package Classification Reflow Temperatures" .
Time within 5 °C of actual Peak Temperature (t_p)	20 - 40 seconds
Ramp-Down rate	6 °C / second max
Time 25 °C to Peak Temperature	8 minutes max

Note: All temperatures refer to topside of the package, measured on the package body surface.

13. REVISION HISTORY

Revision	Date	Description of Change
0.5	Dec. 2007	initial release
0.55	Jan. 2008	corrected footnotes on power supply numbers and D0 Didd/Aidd value
0.8	Jan. 2008	added widget details, corrected ESD/latchup specification/description, corrected value of THD+N specifications to dBr.
0.85	April 10, 2008	updated 32QFN package diagram to include package thickness
0.86	April 16, 2008	corrected pin28 in 32QFN in pin table
0.90	November 10, 2008	removed confidential tags, corrected 32QFN widget and block diagrams, clarified DMIC1 and Port_F as 48QFN package only
0.91	November 14, 2008	Updated orderable part numbers to reflect "B3" and "B4" separate part numbers for the 1.5V and 3.3V HD Audio signaling
1.0	January 8, 2009	Removed preliminary tags
1.0a	July 29, 2009	Corrected Pin 1 description in pin table related to the internal regulator. Added request to see reference design for more information on Pin 1..
1.0b	November 2009	Clarification of Pin 1 in 32QFN package.
