

# Low Power Ambient Light and Proximity Sensor with Intelligent Interrupt and Sleep Modes - Analog and Digital Out

## ISL29030A

The ISL29030A is an integrated ambient and infrared light-to-digital converter with a built-in IR LED driver and I<sup>2</sup>C Interface (SMBus Compatible). This device uses two independent ADCs for concurrently measuring ambient light and proximity in parallel. The flexible interrupt scheme is designed for minimal microcontroller utilization.

For ambient light sensor (ALS) data conversions, an ADC converts photodiode current (with a light sensitivity range of 2000 lux) in 100ms per sample. The ADC rejects 50Hz/60Hz flicker noise caused by artificial light sources. The I<sub>ALS</sub> pin provides an analog output current proportional to the measured light (420µA FSR).

For proximity sensor (Prox) data conversions, the built-in driver turns on an external infrared LED, and the proximity sensor ADC converts the reflected IR intensity to digital. This ADC rejects ambient IR noise (such as sunlight) and has a 540µs conversion time.

The ISL29030A provides low-power operation of the ALS and proximity sensing, with a typical 138µA normal operation current (110µA for sensors and internal circuitry; ~28µA for external LED, with 220mA current pulses for a net 100µs, repeating every 800ms or under).

The ISL29030A uses both a hardware pin and software bits to indicate an interrupt event has occurred. An ALS interrupt is defined as a measurement that is outside a set window. A proximity interrupt is defined as a measurement over a threshold limit. The user can configure the device so that ALS and proximity interrupts occur simultaneously, up to 16 times in a row, before the interrupt pin is activated.

The ISL29030A is designed to operate at 2.25V to 3.63V over the -40°C to +85°C ambient temperature range. It is packaged in a clear, lead-free 8 lead ODFN package.

## Pin Configuration

ISL29030A  
8 LD ODFN (2.0x2.1x0.7mm)  
TOP VIEW

\*THERMAL PAD CAN BE CONNECTED TO GND OR ELECTRICALLY ISOLATED

## Features

- Works Under All Light Sources Including Sunlight
- Dual ADCs Measure ALS/Prox Concurrently
- Intelligent Interrupt Scheme Simplifies Microcontroller Code

### Ambient Light Sensing

- Simple Output Code Directly Proportional to Lux
- 50Hz/60Hz Flicker Noise and IR Rejection
- Light Sensor Close to Human Eye Response
- Selectable 125/2000 Lux Range
- Analog 420µA Output Pin I<sub>ALS</sub> Proportional to Lux

### Proximity Sensing

- Proximity Sensor with Broad IR Spectrum
  - Can Use 850nm and 950nm External IR LEDs
- IR LED Driver with I<sup>2</sup>C Programmable Sink Currents
  - Net 100µs Pulse with 110mA or 220mA Amplitudes
  - Periodic Sleep Time Up to 800ms Between Pulses
- Ambient IR Noise Cancellation (Including Sunlight)

### Intelligent and Flexible Interrupts

- Independent ALS/Prox Interrupt Thresholds
- Adjustable Interrupt Persistency
  - 1/4/8/16 Consecutive Triggers Required Before Interrupt

### Ultra Low Power

- 138µA DC Typical Supply Current for ALS/Prox Sensing
  - 110µA for Sensors and Internal Circuitry
  - 28µA Typical Current for External IR LED (Assuming 220mA for 100µs Every 800ms)
- <1.0µA Supply Current When Powered Down

### Easy to Use

- Set Registers; Wait for Interrupt
- I<sup>2</sup>C (SMBus Compatible) Output
- Temperature Compensated
- Tiny ODFN8 2.0x2.1x0.7 (mm) Package

### Additional Features

- 1.7V to 3.63V Supply for I<sup>2</sup>C Interface
- 2.25V to 3.63V Sensor Power Supply
- Pb-Free (RoHS compliant)

## Applications

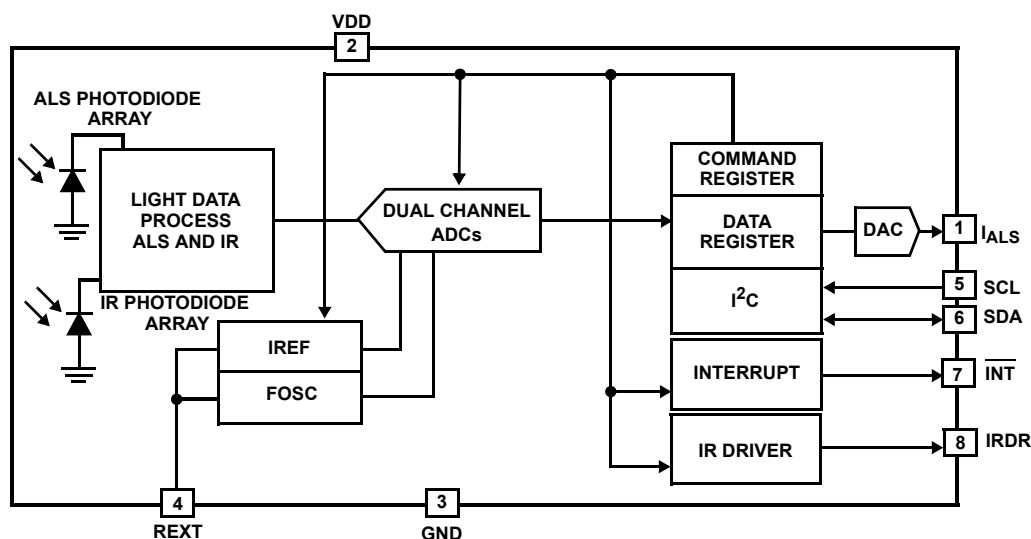

- Display and Keypad Dimming Adjustment and Proximity Sensing for:
  - Mobile Devices: Smart Phone, PDA, GPS
  - Computing Devices: Laptop PC, Netbook
  - Consumer Devices: LCD-TV, Digital Picture Frame, Digital Camera
- Industrial and Medical Light and Proximity Sensing

# ISL29030A

## Pin Descriptions

PIN NUMBER	PIN NAME	DESCRIPTION	
0	T.PAD	Thermal pad (connect to GND or float)	
1	I <sub>ALS</sub>	Analog current output (proportional to ALS/IR Data Count: 420µA FSR)	
2	VDD	Positive supply: 2.25V to 3.63V	
3	GND	Ground	
4	REXT	External resistor (499kΩ; 1%) connects this pin to ground	
5	SCL	I <sup>2</sup> C clock line	The I <sup>2</sup> C bus lines can be pulled from 1.7V to above V <sub>DD</sub> ; 3.63V max
6	SDA	I <sup>2</sup> C data line	
7	INT	Interrupt pin; logic output (open-drain) for interrupt	
8	IRDR	IR LED driver pin; current flows into ISL29030A from LED cathode	

## Block Diagram

## Ordering Information

PART NUMBER (Notes 1, 2, 3)	TEMP. RANGE (°C)	PACKAGE TAPE AND REEL (Pb-free)	PKG. DWG. #
ISL29030AIROZ-T7	-40 to +85	8 Ld ODFN	L8.2.1x2.0
ISL29030AIROZ-EVALZ	Evaluation Board		

### NOTES:

1. Please refer to [TB347](#) for details on reel specifications.
2. These Intersil Pb-free plastic packaged products employ special Pb-free material sets; molding compounds/die attach materials and NiPdAu plate - e4 termination finish, which is RoHS compliant and compatible with both SnPb and Pb-free soldering operations. Intersil Pb-free products are MSL classified at Pb-free peak reflow temperatures that meet or exceed the Pb-free requirements of IPC/JEDEC J STD-020.
3. For Moisture Sensitivity Level (MSL), please see device information page for [ISL29030A](#). For more information on MSL please see techbrief [TB477](#).

# ISL29030A

## Absolute Maximum Ratings (T<sub>A</sub> = +25°C)

V <sub>DD</sub> Supply Voltage between V <sub>DD</sub> and GND	4.0V
I <sup>2</sup> C Bus Pin Voltage (SCL, SDA)	-0.5V to 4.0V
I <sup>2</sup> C Bus Pin Current (SCL, SDA)	<10mA
R <sub>EXT</sub> Pin Voltage	-0.5V to V <sub>DD</sub> + 0.5V
IRDR Pin Voltage	5.5V
I <sub>ALS</sub> Pin Voltage	-0.5V to V <sub>DD</sub> + 0.5V
INT Pin Voltage	-0.5V to 4.0V
INT Pin Current	<10mA
ESD Rating	
Human Body Model (Note 5)	2kV

## Thermal Information

Thermal Resistance (Typical, Note 4)	θ <sub>JA</sub> (°C/W)
8 Ld ODFN	88
Maximum Die Temperature	+90°C
Storage Temperature	-40°C to +100°C
Operating Temperature	-40°C to +85°C
Pb-Free Reflow Profile	see link below <a href="http://www.intersil.com/pbfree/Pb-FreeReflow.asp">http://www.intersil.com/pbfree/Pb-FreeReflow.asp</a>

CAUTION: Do not operate at or near the maximum ratings listed for extended periods of time. Exposure to such conditions may adversely impact product reliability and result in failures not covered by warranty.

### NOTES:

- θ<sub>JA</sub> is measured in free air with the component mounted on a high effective thermal conductivity test board with "direct attach" features. See Tech Brief [TB379](#).
- ESD on all pins is 2kV, except for IRDR, which is 1.5kV.

## Electrical Specifications V<sub>DD</sub> = 3.0V, T<sub>A</sub> = +25°C, R<sub>EXT</sub> = 499kΩ 1% tolerance. Boldface limits apply over the operating temperature range, -40°C to +85°C.

**NOTES:**

- Compliance to datasheet limits is assured by one or more methods: production test, characterization and/or design.
- An LED is used in production test. The LED irradiance is calibrated to produce the same DATA count against a fluorescent light source of the same lux level.
- An 850nm infrared LED is used to test PROX/IR sensitivity in an internal test mode.
- Ability to guarantee  $I_{IRDR}$  leakage of  $\sim 1nA$  is limited by test hardware.
- For ALS applications under light-distorting glass, please see "ALS Range 1 Considerations" on page 10.

## Register Map

There are ten 8-bit registers accessible via I<sup>2</sup>C. Registers 0x1 and 0x2 define the operation mode of the device. Registers 0x3 through 0x7 store the various ALS/IR/Prox thresholds which trigger interrupt events. Registers 0x8 through 0xA store the results of ALS/IR/Prox ADC conversions.

**FIGURE 2. I<sup>2</sup>C DRIVER TIMING DIAGRAM FOR MASTER AND SLAVE CONNECTED TO COMMON BUS**

## Principles of Operation

### I<sup>2</sup>C Interface

The ISL29030A I<sup>2</sup>C interface slave address is internally hardwired as 0b1000100.

Figure 2 shows a sample one-byte read. The I<sup>2</sup>C bus master always drives the SCL (clock) line, while either the master or the slave can drive the SDA (data) line. Every I<sup>2</sup>C transaction begins with the master asserting a start condition (SDA falling while SCL remains high). The first transmitted byte is initiated by the master and includes seven address bits and a R/W bit. The slave is responsible for pulling SDA low during the ACK bit after every transmitted byte.

Each I<sup>2</sup>C transaction ends with the master asserting a stop condition (SDA rising while SCL remains high).

For more information about the I<sup>2</sup>C standard, please consult the Philips™ I<sup>2</sup>C specification documents.

### Photodiodes and ADCs

The ISL29030A contains two photodiode arrays that convert photons (light) into current. The ALS photodiodes are constructed to mimic the human eye wavelength response curve to visible light (see Figure 7). The ALS photodiode current output is digitized by a 12-bit ADC in 100ms. These 12 bits can be accessed by reading from I<sup>2</sup>C registers 0x9 and 0xA when the ADC conversion is completed.

The ALS converter is a charge-balancing, integrating, 12-bit ADC. Charge-balancing is best for converting small current signals in the presence of periodic AC noise. Integrating over 100ms highly rejects both 50Hz and 60Hz light flicker by picking the lowest-integer number of cycles for both 50Hz/60Hz frequencies.

The proximity sensor is an 8-bit ADC that operates in a similar fashion. When proximity sensing is enabled, the IRDR pin drives a user-supplied infrared LED, the emitted IR reflects off an object (i.e., a human head) back into the ISL29030A, and a sensor

converts the reflected IR wave to a current signal in 0.54ms. The ADC subtracts the IR reading before and after the LED is driven (to remove ambient IR such as sunlight) and converts this value to a digital count stored in Register 0x8.

The ISL29030A is designed to run two conversions concurrently: a proximity conversion, and an ALS (or IR) conversion. Please note that because of the conversion times, the user must let the ADCs perform one full conversion first before reading from I<sup>2</sup>C Registers PROX\_DATA (wait 0.54ms) or ALSIR\_DT1/2 (wait 100ms). The timing between ALS and Prox conversions is arbitrary, as shown in Figure 3. The ALS runs continuously, with new data available every 100ms. The proximity sensor runs continuously, with a time between conversions decided by PROX\_SLP (Register 1 Bits [6:4]).

### Ambient Light and IR Sensing

The ISL29030A is set for ambient light sensing when Register bit ALSIR\_MODE = 0 and ALR\_EN = 1. The light-wavelength response of the ALS appears as shown in Figure 6. ALS measuring mode (as opposed to IR measuring mode) is set by default.

When the part is programmed for infrared (IR) sensing (ALSIR\_MODE = 1; ALS\_EN = 1), infrared light is converted into a current and is digitized by the same ALS ADC. The result of an IR conversion is *strongly related* to the amount of IR energy incident on the sensor, but it is unitless and is referred to in digital counts.

### Proximity Sensing

When proximity sensing is enabled (PROX\_EN = 1), the external IR LED is driven through the IRDR pin for 0.1ms by the built-in IR LED driver. The amplitude of the IR LED current depends on Register 1 bit 3: PROX\_DR. If this bit is low, the load sees a fixed

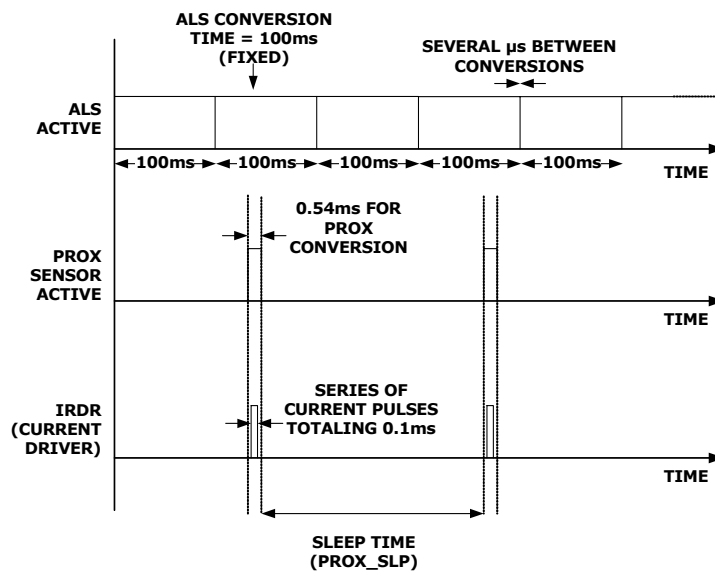

FIGURE 3. TIMING DIAGRAM FOR PROX/ALS EVENTS - NOT TO SCALE

110mA current pulse. If this bit is high, the load on IRDR sees a fixed 220mA current pulse, as shown in Figure 4.

FIGURE 4. CURRENT DRIVE MODE OPTIONS

When the IR from the LED reaches an object and gets reflected back into the ISL29030A, the reflected IR light is converted into current, as shown by the IR spectral response in Figure 7. One entire proximity measurement takes 0.54ms for one conversion (which includes 0.1ms spent driving the LED), and the period between proximity measurements is decided by PROX\_SLP (sleep time) in Register 1 Bits 6:4.

Average LED driving current consumption is given by Equation 1.

$$I_{IRDR(AVG)} = \frac{I_{IRDR(PEAK)} \times 100\mu s}{T_{SLEEP} + 540\mu s} \quad (EQ. 1)$$

A typical IRDR scheme is 220mA amplitude pulses every 800ms, which yields 28µA DC.

## Total Current Consumption

Total current consumption is the sum of  $I_{DD}$  and  $I_{IRDR}$ . The IRDR pin sinks current (as shown in Figure 4), and the average IRDR current can be calculated using Equation 1.  $I_{DD}$  depends on voltage and the mode of operation, as shown in Figure 11.

## Interrupt Function

The ISL29030A has an intelligent interrupt scheme designed to shift some logic processing away from intensive microcontroller I<sup>2</sup>C polling routines (which consume power) and toward a more independent light sensor that can instruct a system to “wake up” or “go to sleep.”

An ALS interrupt event (ALS\_FLAG) is governed by Registers 5 through 7. The user writes high and low threshold values to these registers, and the ISL29030A issues an ALS interrupt flag if the actual counts stored in Registers 0x9 and 0xA are outside the user-programmed window. The user must write 0 to clear the ALS\_FLAG.

A proximity interrupt event (PROX\_FLAG) is governed by the high and low thresholds in Registers 3 and 4 (PROX\_LT and PROX\_HT). PROX\_FLAG is set when the measured proximity data is greater than the high threshold a user-specified consecutive number of times (X; set by the user; see next paragraph). The proximity interrupt flag is cleared when the proximity data is lower than the low proximity threshold X consecutive times, or when the user writes “0” to PROX\_FLAG.

Interrupt persistency is another useful option available for both ALS and proximity measurements. Persistency requires a user-specified number (X) of consecutive interrupt flags before the INT pin is driven low. Both ALS and Prox have their own independent

interrupt persistency options. See ALS\_PRST and PROX\_PRST bits in Register 2.

The final interrupt option is the ability to AND or OR the two interrupt flags using Register 2 Bit 0 (INT\_CTRL). If the user wants simultaneous ALS and Prox interrupts to happen before changing the state of the interrupt pin, the user sets this bit high. If the user wants the interrupt pin to change state when either the ALS or the Proximity interrupt flag goes high, the user leaves this bit at its default value of 0.

## Analog-Out I<sub>ALS</sub> Pin

When ALS\_EN = 1, the analog I<sub>ALS</sub> output pin sources a current directly proportional to the digital count stored in register bits ALSIRDATA[11:0]. When ALS\_EN = 0, this pin is in a high impedance state. See Figure 15 for the effects of the compliance voltage ( $V_{I\_ALS}$ ) on I<sub>ALS</sub>.

## ALS Range 1 Considerations

When measuring ALS counts higher than 1800 on range 1 (ALSIR\_MODE = 0, ALS\_RANGE = 0, ALS\_DATA > 1800), the user must switch to range 2 (change the ALS\_RANGE bit from 0 to 1) and re-measure ALS counts. This recommendation pertains only to applications where the light incident upon the sensor is IR-heavy and is distorted by tinted glass that increases the ratio of infrared to visible light.

## V<sub>DD</sub> Power-up and Power Supply Considerations

At power-up, ensure a V<sub>DD</sub> slew rate of 0.5V/ms or greater. After power-up, or if the power supply temporarily deviates from the factory specification (2.25V to 3.63V), Intersil recommends the user write the following: 0x00 to register 0x01, 0x29 to register 0x0F, 0x00 to register 0x0E, and 0x00 to register 0x0F. The user should then wait ~1ms or more and then rewrite all registers to the desired values. If the user prefers a hardware reset method instead of writing to test registers, then set V<sub>DD</sub> = 0V for 1 second or more, power up again at the required slew rate, and write the desired values to the registers.

## Power-Down

The user can set power-down in two ways. The first is to set both PROX\_EN and ALS\_EN bits to 0 in Register 1. The second and more simple way is to set all bits in Register 1 to 0 (0x00).

## Calculating Lux

When in ALS mode, the ISL29030A ADC output codes are directly proportional to lux (see ALSIR\_MODE bit).

$$E_{calc} = \alpha_{RANGE} \times OUT_{ADC} \quad (EQ. 2)$$

In Equation 2,  $E_{calc}$  is the calculated lux reading, and OUT represents the ADC code. The constant,  $\alpha$ , which is to plug in, is determined by the range bit, ALS\_RANGE (register 0x1 bit 1) and is independent of the light source type.

**TABLE 15. ALS SENSITIVITY AT DIFFERENT RANGES**

ALS_RANGE	$\alpha_{\text{RANGE}}$ (Lux/Count)
0	0.0326
1	0.522

Table 15 shows two different scale factors: one for the low range (ALS\_RANGE = 0) and the other for the high range (ALS\_RANGE = 1).

## Noise Rejection

Charge balancing ADCs have excellent noise-rejection characteristics for periodic noise sources for which frequency is an integer multiple of the conversion rate. For instance, a 60Hz AC unwanted signal's sum from 0ms to  $k \cdot 16.66\text{ms}$  ( $k = 1, 2, \dots, k_i$ ) is zero. Similarly, setting the device's integration time to be an integer multiple of the periodic noise signal greatly improves the light sensor output signal in the presence of noise. Since wall sockets may output at 60Hz or 50Hz, the factory-set integration time is 100ms, which is the lowest common integer number of cycles for both frequencies.

## Proximity Detection of Various Objects

Proximity sensing relies on the amount of IR reflected back from objects. A perfectly black object absorbs all light and reflects no photons. The ISL29030A is sensitive enough to detect black ESD foam, which reflects only 1% of IR. For biological objects, blonde hair reflects more than brown hair, and customers may notice that skin tissue is much more reflective than hair. IR penetrates into the skin and is reflected or scattered back from within. As a result, the proximity count peaks at contact and monotonically decreases as skin moves away. The reflective characteristics of skin are very different from that of paper.

## Typical Circuit

A typical application for the ISL29030A is shown in Figure 5. The ISL29030A I<sup>2</sup>C address is internally hardwired as 0b1000100. The device can be tied onto a system I<sup>2</sup>C bus together with other I<sup>2</sup>C compliant devices.

## Soldering Considerations

Convection heating is recommended for reflow soldering; direct-infrared heating is not recommended. The plastic ODFN package does not require a custom reflow soldering profile, and is qualified to +260°C. A standard reflow soldering profile with a +260°C maximum is recommended.

## Suggested PCB Footprint

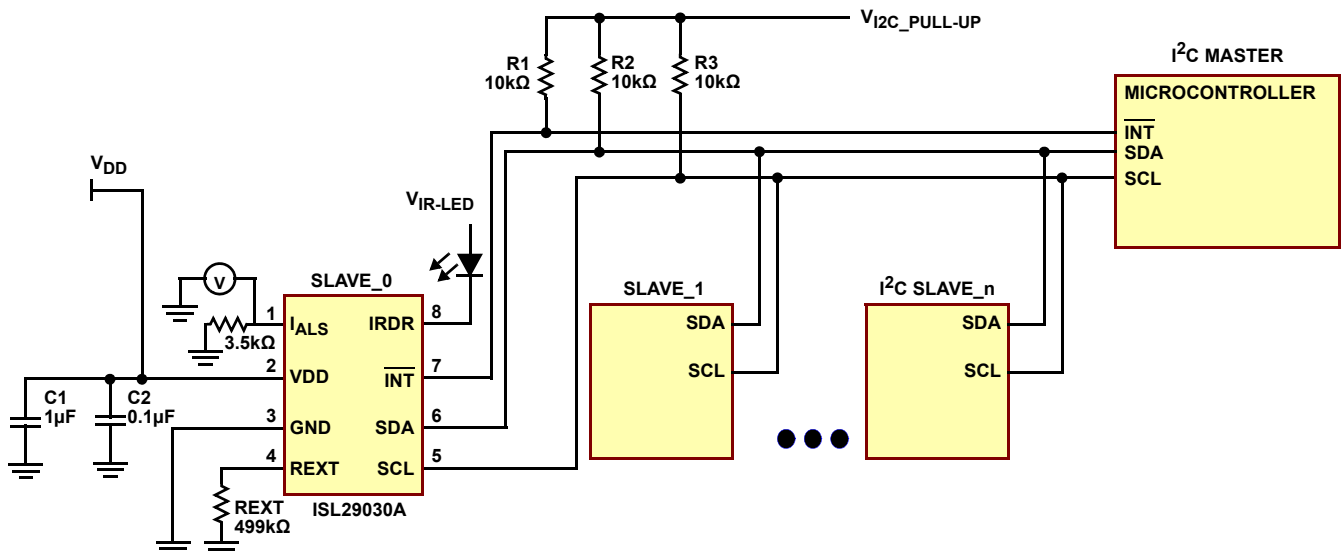

It is important that users see [TB477](#), "Surface Mount Assembly Guidelines for Optical Dual FlatPack No Lead (ODFN) Package" before starting ODFN product board mounting.

## Layout Considerations

The ISL29030A is relatively insensitive to layout. Like other I<sup>2</sup>C devices, it is intended to provide excellent performance, even in significantly noisy environments. To ensure best performance, route the supply and I<sup>2</sup>C traces as far as possible from all sources of noise, and place a 0.1µF and 1µF power supply decoupling capacitor close to the device.

## ALS Sensor Window Layout

Special care should be taken to ensure that the sensor is uniformly illuminated, as shown in Figure 16, "8 LD ODFN SENSOR LOCATION OUTLINE - DIMENSIONS IN mm". Shadows from window openings that affect uniform illumination can distort measurement results.

## Revision History

The revision history provided is for informational purposes only and is believed to be accurate, but not warranted. Please go to web to make sure you have the latest Rev.

DATE	REVISION	CHANGE
3/18/2011	FN7722.1	Page 7, Table 2, changed ACCESS from R0 to (n/a) Page 10, Eq. 1, added "+ 540 $\mu$ s" to the divisor, T <sub>SLEEP</sub> . Changed I <sub>IRDR(AVE)</sub> to I <sub>IRDR(AVG)</sub> . Page 10, in "ALS Range 1 Considerations" section, removed reference to document of that title. Page 11, added section, "ALS Sensor Window Layout" Page 16, replaced Package Outline Drawing Rev 1, dated 12/09 with Rev 3, dated 1/11. Converted to latest Intersil datasheet template
11/18/10	FN7722.0	Initial release

## Products

Intersil Corporation is a leader in the design and manufacture of high-performance analog semiconductors. The Company's products address some of the industry's fastest growing markets, such as, flat panel displays, cell phones, handheld products, and notebooks. Intersil's product families address power management and analog signal processing functions. Go to [www.intersil.com/products](http://www.intersil.com/products) for a complete list of Intersil product families.

\*For a complete listing of Applications, Related Documentation and Related Parts, please see the respective device information page on intersil.com: [ISL29030A](http://www.intersil.com/ISL29030A)

To report errors or suggestions for this datasheet, please go to: [www.intersil.com/askourstaff](http://www.intersil.com/askourstaff)

FITs are available from our website at: <http://rel.intersil.com/reports/sear>

For additional products, see [www.intersil.com/product\\_tree](http://www.intersil.com/product_tree)

Intersil products are manufactured, assembled and tested utilizing ISO9000 quality systems as noted in the quality certifications found at [www.intersil.com/design/quality](http://www.intersil.com/design/quality)

*Intersil products are sold by description only. Intersil Corporation reserves the right to make changes in circuit design, software and/or specifications at any time without notice. Accordingly, the reader is cautioned to verify that data sheets are current before placing orders. Information furnished by Intersil is believed to be accurate and reliable. However, no responsibility is assumed by Intersil or its subsidiaries for its use; nor for any infringements of patents or other rights of third parties which may result from its use. No license is granted by implication or otherwise under any patent or patent rights of Intersil or its subsidiaries.*
