QUICKSWITCH[®] PRODUCTS HIGH-SPEED CMOS QUICKSWITCH 32-BIT MULTIWIDTH[™] BUS SWITCHES

DESCRIPTION:

conventional logic devices.

FEATURES:

- · Enhanced N channel FET with no inherent diode to Vcc
- · Bidirectional switches connect inputs to outputs
- Zero propagation delay, zero ground bounce
- QS34X245 is 32-bit version of QS3245
- · Flow-through pinout for easy layout
- · Undershoot clamp diodes on all switch and control inputs
- TTL-compatible control inputs
- Available in 80-pin MilliPaQ[™] package

APPLICATIONS:

- · Hot-swapping, hot-docking
- Voltage translation (5V to 3.3V)
- Bus switching and isolation
- · Power conservation
- · Logic replacement (data processing)
- Capacitance isolation
- Clock gating

FUNCTIONAL BLOCK DIAGRAM

The QS34X245 is a member of the MultiWidth™ family of QuickSwitch

devices and provides a set of 32 high-speed CMOS compatible bus switches

in a flow-through pinout. This device is available in the MilliPaQ package,

the world's first small outline 32-bit solution. The low ON-resistance of the

QS34X245 allows inputs to be connected to outputs without adding propa-

gation delay and without generating additional ground bounce noise. When

Output Enable (OEn) is low, the switches are turned on, connecting bus A

to bus B. When OEn is high, the switches are turned off. This device is ideally

suited for 32/64 bit applications where board space is at a premium. QuickSwitch devices provide speeds an order of magnitude faster than

The QS34X245 is characterized for operation at -40°C to +85°C.

NOTE:

 Stresses greater than those listed under ABSOLUTE MAXIMUM RATINGS may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect reliability.

| ICCD | Dynamic Power Supply Current per MHz ⁽³⁾ | Vcc = Max., A and B pins open Control Inputs Toggling at 50% Duty Cycle | 0.25 | mA/MHz |

NOTES:

1. For conditions shown as Min. or Max., use the appropriate values specified under DC Electrical Characteristics.

2. Per TLL driven input (VIN = 3.4V, control inputs only). A and B pins do not contribute to Δ Icc.

3. This current applies to the control inputs only and represents the current required to switch internal capacitance at the specified frequency. The A and B inputs generate no significant AC or DC currents as they transition. This parameter is guaranteed but not production tested.

SWITCHING CHARACTERISTICS OVER OPERATING RANGE

 $T_A = -40^{\circ}C \text{ to } +85^{\circ}C, V_{CC} = 5.0V \pm 5\%;$

CLOAD = 50pF, RLOAD = 500Ω unless otherwise noted.

| Symbol | Parameter | Min. ⁽¹⁾ | Тур. | Max. | Unit |
|--------------|---|---------------------|------|------|------|
| t PLH | Data Propagation Delay ^(1,2) | — | — | 0.25 | ns |
| t PHL | An to/from Bn | | | | |
| tPZL | Switch Turn-on Delay | 0.5 | — | 5.6 | ns |
| tрzн | OE to An/Bn | | | | |
| tPLZ | Switch Turn-off Delay ⁽¹⁾ | 0.5 | — | 5.2 | ns |
| tphz | OE to An/Bn | | | | |

NOTES:

1. Minimums are guaranteed but not production tested.

2. The bus switch contributes no propagation delay other than the RC delay of the ON resistance of the switch and the load capacitance. The time constant for the switch alone is of the order of 0.25ns for CL = 50pF. Since this time constant is much smaller than the rise and fall times of typical driving signals, it adds very little propagation delay to the system. Propagation delay of the bus switch, when used in a system, is determined by the driving circuit on the driving side of the switch and its interaction with the load on the driven side.
