## Attention please!

The information herein is given to describe certain components and shall not be considered as warranted characteristics.
Terms of delivery and rights to technical change reserved.
We hereby disclaim any and all warranties, including but not limited to warranties of non-infringement, regarding circuits, descriptions and charts stated herein.
Infineon Technologies is an approved CECC manufacturer.

## Information

For further information on technology, delivery terms and conditions and prices please contact your nearest Infineon Technologies Office in Germany or our Infineon Technologies Representatives worldwide (see address list).

## Warnings

Due to technical requirements components may contain dangerous substances. For information on the types in question please contact your nearest Infineon Technologies Office.
Infineon Technologies Components may only be used in life-support devices or systems with the express written approval of Infineon Technologies, if a failure of such components can reasonably be expected to cause the failure of that life-support device or system, or to affect the safety or effectiveness of that device or system. Life support devices or systems are intended to be implanted in the human body, or to support and/or maintain and sustain and/or protect human life. If they fail, it is reasonable to assume that the health of the user or other persons may be endangered.

## 1 <br> Overview

The PEB 80902 (T-SMINT ${ }^{\circledR}$ O) offers all NT1 features known from the PEB 8090 [9] and can hence replace the latter in all NT1 applications.

Table 1 on Page 1 summarizes the 2nd generation NT products.
Table $1 \quad$ NT Products of the 2nd Generation

## 4B3T Second Gen. Modular ISDN NT (Ordinary) T-SMINT ${ }^{\circledR} 0$

PEF 80902

## Version 1.1

CMOS

## $1.2 \quad$ Features

## Features known from the PEB 8090

- Single chip solution including U- and S-transceiver
- Perfectly suited for the NT1 in the ISDN
- Fully automatic activation and deactivation
- U-interface (4B3T) conform to ETSI [1] and FTZ [2]:
- Meets all transmission requirements on all ETSI and FTZ loops with margin

- S/T-interface conform to ETSI [4], ANSI [5] and ITU [6]
- Supports point-to-point and bus configurations
- Meets and exceeds all transmission requirements
- Optional $I O M^{\circledR}-2$ interface eases chip testing and evaluation
- Power-on reset and Undervoltage Detection with no external components
- ESD robustness 2 kV

| Type | Package |  |

| PEF 80902 | P-MQFP-44 |  |
| Data Sheet | 3 | $2001-11-12$ |

Overview

## New Features

- Optional use of transformers with non-negligible resistance corresponding to up to $20 \Omega$ on the line sidePin Vref and the according external capacitor removed
- Inputs accept 3.3 V and 5 V
- I/O (open drain) accepts pull-up to $3.3 \mathrm{~V}^{1)}$
- Pin compatible with Q-SMINT ${ }^{\circledR} \mathrm{O}$ (2nd Generation)
- LEDs indicating Loopback 2 and activation status
- Lowest power consumption due to
- Low power CMOS technology ( $0.35 \mu$ )
- Newly optimized low power libraries
- High output swing on $U$ - and S-line interface leads to minimized power consumption
- Single 3.3 Volt power supply
- 185 mW (NTC-T: 233 mW ) power consumption with random data over ETSI Loop 2.
- 15 mW typical power consumption in power down (as NTC-T; NTC-Q: 28mW)

### 1.3 Not Supported are ...

- No integrated hybrid is provided by the $\mathrm{T}-\mathrm{SMINT}^{\circledR} \mathrm{O}$. Therefore, an external hybrid is always required, which consists of only two additional resistors as compared to an integrated hybrid, but allows for more flexibility in board design.
- Auxiliary $I O M^{\circledR}-2$ interface
- SRA (capacitive receiver coupling is not suited for S-feeding)
- NT-Star with star point on the $1 \mathrm{IM}^{\circledR}-2$ bus (already not supported in NTC-T).

1) Pull-ups to 5 V must be avoided. A so-called 'hot-electron-effect' would lead to long term degradation.

I: Input
O: Output (Push-Pull)
OD: Output (Open Drain)

### 1.6.1 Specific Pins and Test Modes

## LED Pins ACT, LP2I

A LED can be connected to pin $\overline{\text { ACT }}$ to display four different states (off, slow flashing, fast flashing, on). It displays the activation status of the $U$ - and S-transceiver according to Table 3.

PEF 80902

Table 3 ACT States

| Pin $\overline{\text { ACT }}$ | LED | U_Deactivated | U_Activated | S_Activated |
| :--- | :--- | :--- | :--- | :--- |
| $\mathrm{V}_{\text {DD }}$ | OFF | 1 | $x$ | $x$ |
| $2 \mathrm{~Hz}(1: 1)^{*}$ | fast flashing | 0 | 0 | $x$ |
| $1 \mathrm{~Hz}(3: 1)^{\star}$ | slow flashing | 0 | 1 | 0 |
| GND | ON | 0 | 1 | 1 |

Note: * denotes the duty cycle 'high' : 'low'.
with:
U_Deactivated: 'Deactivated State' as defined in Chapter 2.3.7.6.
U_Activated: 'SBC Synchronizing', 'Wait for Info U4H', and 'Transparent' as defined in Chapter 2.3.7.6.
S-Activated: 'Activated State' as defined in Chapter 2.4.5.1.
Note: Optionally, pin $\overline{\text { ACT }}$ can drive a second LED with inverse polarity (connect this additional LED to 3.3 V only).

Another LED can be connected to pin LP2I to indicate an active Loopback 2 according to Table 4.

Table $4 \quad$ LP2I States

| Pin $\overline{\text { LP2I }}$ | LED | Loopback 2 command in the $\mathbf{C}_{\mathrm{L}}$-channel |
| :--- | :--- | :--- |
| $\mathrm{V}_{\mathrm{DD}}$ | off | received no loopback 2 command or loopback deactivation <br> after a loopback 2 command. |
| GND | on | Loopback 2 command has been received. Complete analog <br> loop is being closed on the S-interface. |

## Test Modes

Different test patterns on the $U$ - and S-interface can be generated via pins TMO-2 according to Table 5.
Table 5 Test Modes

| TM0 | TM1 | TM2 | U-transceiver | S-transceiver |
| :---: | :---: | :---: | :--- | :--- |
| 0 | 0 | 0 | Reserved for future use. Normal operation in this |  |
| 0 | 0 | 1 | version. |  |
| 0 | 1 | 0 | Normal operation | $96 \mathrm{kHz}^{1)}$ <br> Continuous Pulses |
| 0 | 1 | 1 |  | $2 \mathrm{kHz}^{2)}$ Single Pulses |
| 0 |  |  |  |  |

Table $5 \quad$ Test Modes (cont'd)

| TM0 | TM1 | TM2 | U-transceiver | S-transceiver |
| :---: | :---: | :---: | :--- | :--- |
| 1 | 0 | 0 | Data Through |  |
| 1 | 0 | 1 | Send Single Pulses $^{4)}$ | Normal operation |
| 1 | 1 | 0 | Quiet Mode $^{5)}$ |  |
| 1 | 1 | 1 | normal operation |  |

1) The S-transceiver transmits pulses with alternating polarity at a rate of 192 kHz resulting in a 96 kHz envelope.
2) The S-transceiver transmits pulses with alternating polarity at a rate of 4 kHz resulting in a 2 kHz envelope.
3) Forces the U-transceiver into the state 'Transparent' where it transmits signal U5.
${ }^{4)}$ Forces the U-transceiver to go into state 'Test' and to send single pulses. The pulses are issued at 1.0 ms intervals and have a duration of $8.33 \mu \mathrm{~s}$.
4) The U-transceiver is hardware reset.

### 1.7 System Integration

The T-SMINT ${ }^{\circledR}$ O provides NT1 functionality without a microcontroller being necessary. Special selections can be done via pin strapping (DIO, BUS, TMO-2). The device has no $\mu \mathrm{P}$ interface.
The $I O M^{\circledR}-2$ Interface serves only for monitoring and debugging purposes. It can be regarded as a window to the internal $1 O M^{\circledR}-2$.

Figure 3 Application Example T-SMINT ${ }^{\circledR}$ O: Standard NT1

## 2 Functional Description

### 2.1 Reset Generation

## External Reset Input

At the $\overline{\text { RST }}$ input an external reset can be applied forcing the T-SMINT ${ }^{\circledR} \mathrm{O}$ in the reset state. This external reset signal is additionally fed to the RSTO output.

## Reset Ouput

If $\overline{\text { VDDDET }}$ is active, then the deactivation of a reset output on $\overline{\operatorname{RSTO}}$ is delayed by $t_{\text {DEACT }}$ (see Table 28).

## Reset Generation

The T-SMINT ${ }^{\circledR}$ O has an on-chip reset generator based on a Power-On Reset (POR) and Under Voltage Detection (UVD) circuit (see Table 28). The POR/UVD requires no external components.
The POR/UVD circuit can be disabled via pin VDDDET.
The requirements on $V_{D D}$ ramp-up during power-on reset are described in Chapter 4.6.3.

## Clocks and Data Lines During Reset

During reset the data clock (DCL) and the frame synchronization (FSC) keep running.
During reset DD and DU are high; with the exception of:

- The output C/I code from the U-Transceiver on DD is 'DR' = 0000
- The output C/l code from the S-Transceiver on DU is 'TIM' $=0000$.

PEF 80902

Functional Description

## $2.2 \quad$ IOM ${ }^{\circledR}$-2 Interface

The $I O M^{\circledR}-2$ interface always operates in NT mode according to the $I O M^{\circledR}-2$ Reference Guide [12].

### 2.2.1 $\quad \mathrm{IOM}^{\circledR}-2$ Functional Description

The $I O M^{\circledR}-2$ interface consists of four lines: FSC, DCL, DD, DU. The rising edge of FSC indicates the start of an $I O M^{\circledR}-2$ frame. The DCL clock signal synchronizes the data transfer on both data lines DU and DD. The DCL is twice the bit rate. The bits are shifted out with the rising edge of the first DCL clock cycle.
Note: It is not possible to write any data via $1 O M^{\circledR}-2$ into the $\mathrm{T}-\mathrm{SMINT}^{\circledR} \mathrm{O}$.
The $I O M^{\circledR}-2$ interface can be enabled/disabled with pin DIO.
The FSC signal is an 8 kHz frame sync signal. The number of PCM timeslots on the transmit line is determined by the frequency of the DCL clock , with the 512 kHz clock 1 channel consisting of 4 timeslots is available.

## IOM ${ }^{\circledR}-2$ Frame Structure of the $\mathrm{T}_{-S M I N T}{ }^{\circledR} \mathrm{O}$

The frame structure on the $1 \mathrm{OM}^{\circledR}-2$ data ports (DU,DD) of the $\mathrm{T}-\mathrm{SMINT}^{\circledR} \mathrm{O}$ with a DCL clock of 512 kHz is shown in Figure 4.

Figure $4 \quad$ IOM ${ }^{\circledR}-2$ Frame Structure of the T-SMINT ${ }^{\circledR} \mathrm{O}$
The frame is composed of one channel:

- Channel 0 contains $144-k b i t / s$ of user and signaling data ( $2 \mathrm{~B}+\mathrm{D}$ ), a MONITOR programming channel (not available in $\mathrm{T}-\mathrm{SMINT}^{\circledR} \mathrm{O}$ ) and a command/indication channel (CIO) for control of e.g. the U-transceiver.

### 2.3 U-Transceiver

The statemachine of the U-Transceiver is compatible to the NT state machine in the PEB 8090 documentation [9], but includes some minor changes for simplification and compliance to Ref. [1].
Basic configurations are selected via pin strapping

### 2.3.1 4B3T Frame Structure

The 4B3T U-interface performs full duplex data transmission and reception at the Ureference point according to ETSI TS 102080 and FTZ 1TR 220. It applies the 4B3T block code together with adaptive echo cancelling and equalization. Transmission performance shall be such, that it meets all ETSI and FTZ test loops with margin.
The U-interface is designed for data transmission on twisted pair wires in local telephone loops, with basic access to ISDN and a user bit rate of $144 \mathrm{kbit} / \mathrm{s}$.
The following information is transmitted over the twisted pair:

- Bidirectional:
- B1, B2, D data channels
- 120 kHz Symbol clock
- 1 kHz Frame
- Activation
- 1 kbit/s Transparent Channel (M symbol), (not implemented)
- From LT to NT side:
- Power feeding
- Deactivation
- Remote control of test loops (M symbol)
- From NT to LT side:
- Indication of monitored code violations (M symbol)

## Performance Requirements according to FTZ 1 TR 220 (August 1991):

On the U-interface, the following transmission ranges are achieved without additional signal regeneration on the loop (bit error rate $\leq 10^{-7}$ ):

- with noise: $\geq 4.2 \mathrm{~km}$ on wires of 0.4 mm diameter and $\geq 8 \mathrm{~km}$ on 0.6 mm wires
- without noise: $\geq 5 \mathrm{~km}$ on wires of 0.4 mm diameter and $\geq 10 \mathrm{~km}$ on 0.6 mm wires

Note: Typical attenuation of FTZ wires of 0.4 mm diameter is about $7 \mathrm{~dB} / \mathrm{km}$ in contrast to ETSI wires of 0.4 mm with about $8 \mathrm{~dB} / \mathrm{km}$.

The transmission ranges can be doubled by inserting a repeater for signal regeneration. Performance requirements according to ETSI TS 102080 are met, too.
1 ms frames are transmitted via the U-interface, each consisting of:

- 108 symbols: 144 bit scrambled and coded B1 + B2 + D data

## Functional Description

- 11 symbols: Barker code for both symbol and frame synchronization (not scrambled)
- 1 symbol: Ternary maintenance symbol (not scrambled)

The 108 user data symbols are split into four equally structured groups. Each group ( 27 ternary symbols, resp. 36 bits) contains the user data of two $I O M^{\circledR}-2$ frames in the same order $(8 \mathrm{~B}+8 \mathrm{~B}+2 \mathrm{D}+8 \mathrm{~B}+8 \mathrm{~B}+2 \mathrm{D})$.
Different syncwords are used for each direction:

- Downstream from LT to NT
$+++---+--+-$
- Upstream from NT to LT

On the NT side, the transmitted Barker code begins 60 symbols after the received Barker code and vice versa.

$\mathrm{U}_{1} \ldots \mathrm{U}_{8} \quad$ Ternary $2 \mathrm{~B}+\mathrm{D}$ data of $I O M^{\circledR}-2$ frames $1 \ldots 8$
M Maintenance symbol
+, - Syncword

PEF 80902

Functional Description

### 2.3.2 Maintenance Channel

The 4B3T frame structure provides a $1 \mathrm{kbit} / \mathrm{s}$ M(aintenance)-channel for the transfer of remote loopback commands and error indications.

## Loopback Commands

The LT station uses the M-channel to request remote loopbacks. Loopback commands are coded with a series of ' 0 ' and ' + ' symbols.

- A continuous series of ' + ' requests for loopback 2 activation in the NT
- A continuous series of '0' requests for deactivation of any loopback

The NT station reacts as soon as the pattern has been detected in 8 consecutive symbols.

## Error Indications

The NT U-transceiver reports line code violations via the M-channel to the exchange by setting one M-Bit to '+' polarity.

## Transparent Messages

The exchange of Transparent Messages via the Transparent Channel is not supported by the T-SMINTO.

### 2.3.3 Coding from Binary to Ternary Data

Each 4 bit block of binary data is coded into 3 ternary symbols of MMS 43 block code according to Table 8.
The number of the next column to be used, is given at the right hand side of each block. The left hand signal elements in the table (both ternary and binary) are transmitted first.

## Table 8 MMS 43 Coding Table

## Functional Description

| 1 | 1 | 0 | 0 | + | + | + | 4 | - | + | - | 1 | - | + | - | 2 |  | + | - | 3 |

### 2.3.4 Decoding from Ternary to Binary Data

Decoding is done in the reverse manner of coding. The received blocks of 3 ternary symbols are converted into blocks of 4 bits. The decoding algorithm is given in Table 9.
As in the encoding table, the left hand symbol of each block (both binary and ternary) is the first bit and the right hand is the last. If a ternary block "000" is received, it is decoded to binary "0000". This pattern usually occurs only during deactivation.

Table 9 4B3T Decoding Table

| Ternary Block |  |  | Binary Block |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 000 | + 0 +, | 0-0 | 0 | 0 | 0 | 0 |
| 0 - + |  |  | 0 | 0 | 0 | 1 |
| + - 0 |  |  | 0 | 0 | 1 | 0 |

| :---: | :---: | :---: | :---: | :---: | :---: |
| $0+-$ |  | 1 | 1 |  |  |
| ++0, | 0 | $0-$ | 1 | 0 |  |

### 2.3.4.1 Monitoring of Code Violations

The running digital sum monitor (RDSM) computes the running digital sum from the received ternary symbols by adding the polarity of the received user data ( $+1,0,-1$ ). At the end of each block, the running digital sum is supposed to reflect the number of the next column in Table 8.
A code violation has occurred if the running digital sum is less than one or more than four at the end of a ternary block, or if the ternary block 000 (three user symbols with zero polarity) is found in the received data.
If at the end of a ternary block no error was found, the running digital sum retains its current value. If the counter value is greater than 4 , it is set to 4 at the beginning of the next ternary block, if its value is 0 or less, it is set to one. So after a code violation has been detected, the RDSM synchronizes itself within a period depending on the received data pattern. Note there are some transmission errors which do not cause a code violation.

### 2.3.5 Scrambler / Descrambler

## Scrambler

The binary transmit data from the $1 \mathrm{IM}^{\circledR}-2$ interface is scrambled with a polynomial of 23 bits, before it is sent to the 4B3T coder. The scrambler polynomial is::

$$
z^{-23}+z^{-18}+1
$$

## Descrambler

The received data (after decoding from ternary to binary) is multiplied with a polynomial of 23 bits in order to recover the original data before it is forwarded to the $10 M^{\circledR}-2$ interface.The descrambler is self synchronized after 23 symbols. The descrambler polynomial is::

$$
z^{-23}+z^{-5}+1
$$

The scrambling / descrambling process is controlled fully by the T-SMINTO. Hence, no influence can be taken by the user.

### 2.3.6 Command/Indication Codes

Both commands and indications depend on the data direction. Table 10 presents all defined $\mathrm{C} / \mathrm{l}$ codes. A new command or indication will be recognized as valid after it has been detected in two successive $10 \mathrm{M}^{\circledR}$-2 frames (double last-look criterion).
Indications are strictly state orientated. Refer to the state diagrams in the following sections for commands and indications applicable in various states.

## Table 10 C/I Codes

| Code | IN | OUT |
| :--- | :---: | :---: |
| 0000 | TIM | DR |
| 0001 | - | - |
| 0010 | - | - |
| 0011 | LTD | - |
| 0100 | - | RSY |
| 0101 | SSP | - |
| 0110 | DT | - |
| 0111 | - | - |
| 1000 | AR | AR |
| 1001 | reserved 1$)$ | - |
| 1010 | - | ARL |
| 1011 | - | - |
| 1100 | AI | AI |
| 1101 | RES | - |
| 1110 | - | AIL |
| 1111 | DI | DC |

1) $\mathrm{C} / \mathrm{I}$ code '1010' must not be input to the U-transceiver.

| AI | Activation Indication | DI | Deactivation Indication. |
| :--- | :--- | :--- | :--- |
| AIL | Activation Indication Loop 2 | DR | Deactivation Request |
| AR | Activation Request | LTD | LT Disable |
| ARL | Activation Request Local Loop | RES | Reset |
| DT | Data Through Mode | RSY | Resynchronization Indication |

| SSP | Send-Single-Pulses |
| :--- | :--- |
| TIM | Timing Request |

### 2.3.7 State Machine for Activation and Deactivation

### 2.3.7.1 State Machine Notation

The following state diagram describes all the actions/reactions resulting from any command or detected signal and resulting from the various operating modes.
The states with its inputs and outputs are interpreted as shown below:

## Figure $5 \quad$ State Diagram Example

Each state has one or more transitions to other states. These transitions depend on certain conditions which are noted next to the transition lines. These conditions are the only possibility to leave a state. If more conditions have to be fulfilled together, they are put into parentheses with an AND operator (\&). If more than one condition leads to the same transition, they are put into parentheses with an OR operator (I). The meaning of a condition may be inverted by the NOT operator (/). Only the described states and transitions exist.
At some transitions, an internal timer is started. The start of a timer is indicated by TxS (' $x$ ' is the timer number). Transitions that are caused if a timer has expired are labelled by TxE.
Some conditions lead to the same target state. To reduce the number of lines and the complexity of the figures, a state named "ANY STATE" acts on behalf of all state.

## Functional Description

The state machines are designed to cope with all ISDN devices with $I O M^{\circledR}-2$ standard interfaces. Undefined situations are excluded. In any case, the involved devices will enter defined conditions as soon as the line is deactivated.

### 2.3.7.2 Awake Protocol

For the awake process two signals are defined' U1W' and 'U2W'. Depending on the call direction (up-, downstream) U1W and U2W are interpreted as awake or acknowledge signals (see figures below).

Figure 6 Awake Procedure initiated by the LT

Figure $7 \quad$ Awake Procedure initiated by the NT

## Functional Description

## Acting as Calling Station

After sending the awake signal, the awaking U-transceiver waits for the acknowledge. After 12 ms , the awake signal is repeated, if no acknowledge has been recognized.

If an acknowledge signal has been recognized, the U-transceiver waits for its possible repetition (in case of previous coincidence of two awake signals). If no repetition was detected, the U-transceiver starts transmitting U2 with a delay of 7 ms .
If such a repetition is detected, the U-transceiver interprets it as an awake signal and behaves like a device awoken by the far end.

## Acknowledging a Wake-Up Call

If a deactivated device detects an awake signal on $U$, an acknowledge signal is sent out. After that, the U-transceiver waits for a possible repetition of the awake signal (in case the acknowledge hasn't been recognized).

If no repetition is found, the awoken U-transceiver starts sending U2 after 7 ms from detecting the awake signal. If a repeated awake signal is found, the procedure in the awoken U-transceiver starts again.

## Functional Description

### 2.3.7.3 NT State Machine (IEC-T / NTC-T Compatible)

Figure 8 NT State Machine (IEC-T/NTC-T Compatible)
Note: The test modes 'Data Through' (DT), 'Send Single Pulses' (SSP) and ‘Quiet Mode‘ (QM) can be generated via pins TM0-2 according to Table 5.

## Table 11 Differences to the former NT-SM of the IEC-T/NTC-T

| No. | State/ Signal | Change | Comment |
| :---: | :--- | :--- | :--- |
| 1. | State 'Deact. <br> Request Rec.' | split into 3 states <br> -'Pend. Deactivation 1' <br> -'Reset' 'state <br> - | simplifies SM implementation |
| 2. | State 'Loss of <br> Framing' | new inserted, <br> results in different behavior <br> in state 'Transparent', <br> no return to normal <br> transmission possible after <br> detection of LOF | compliance to ETSI TS 102 080, <br> corresponds to state NT1.10 |
| 3. | C/l-code LTD | new inserted | for consistency reasons to 2B1Q |
| 4. | State <br> 'Power Down' | renamed to state <br> 'Deactivated' | renamed to state <br> 'Transparent' |
| 5. | State <br> 'Data <br> Transmission' | Name Duration <br> 6.Timer <br> variables <br> introduced | see Table 12 |

### 2.3.7.4 Inputs to the U-Transceiver

## C/I-Commands

AI Activation Indication
The downstream device issues this indication to announce that layer 1 is available. The U-transceiver in turn informs the LT side by transmitting U3.

AR Activation Request
The U-transceiver is requested to start the activation process (if not already done) by sending the wake-up signal U1W.

DI Deactivation Indication
This indication is used during a deactivation procedure to inform the Utransceiver that it may enter the 'Deactivated' (power-down) state.

DT Data Through Test Mode
This unconditional command is used for test purposes only and forces the Utransceiver into state 'Transparent'.

## LTD LT Disable

This unconditional command forces the U-transceiver to state 'Test', where it transmits UO. No further action is initiated.

RES Reset Unconditional command which resets the U-transceiver.

SSP Send Single Pulses
Unconditional command which requests the transmission of single pulses on the U-interface.

TIM Timing
The U-transceiver is requested to enter state 'IOM Awaked'.

## U-Interface Events

U0 U0 detected
U0 is recognized after 120 symbols (1ms) with zero level in a row. Detection may last up to 2 ms .

U2 U2 detected
The U-transceiver detects U2 if continuous binary O's are found after descrambling and LOF $=0$ for at least 8 subsequent $U$-frames. $U 2$ is detected after 8 to 9 ms .

U4H U4H detected
U 4 H is recognized, if the U-transceiver detects 16 subsequent binary 1 's after descrambling.

AWR Awake signal (U2W) detected
AWT Awake signal (U1W) has been sent out
LOF Loss of Framing on U-interface
TxE Timer ended, the started timer has expired

## Timers

The start of timers is indicated by TxS, the expiry by TxE. The following table shows which timers are used.

Table 12 Timers

| Timer | Duration (ms) | Function | State |
| :--- | :--- | :--- | :--- |
| T05 | 0.5 | C/I code recognition | Pend. Deactivation, <br> Deactivating |
| T6 | 6 | Supervises U1W repetition | Start Awaking Uk0 |

Table 12 Timers (cont'd)

| Timer | Duration (ms) | Function | State |
| :--- | :--- | :--- | :--- |
| T12 | 12 | Prevents the U-transceiver in <br> state Synchronizing from <br> immediate transition to state <br> 'Pend. Deactivation' if U0 is <br> detected | Synchronizing |
| T13 | 13 | Supervises U2W repetition | Ack. sent / received <br> Sending awake-ack. |

### 2.3.7.5 Outputs of the U-Transceiver

Below the signals and indications are summarized that are issued on $1 \mathrm{OM}^{\circledR}-2(\mathrm{C} / \mathrm{l}$ indications) and on the U-interface (predefined U-signals).

## C/I Indications

AI Activation Indication
The U-transceiver has established transparency of transmission. The downstream device is requested to establish layer- 1 functionality.
AIL Activation Indication Loop-back
The U-transceiver has established transparency of transmission. The downstream device is requested to establish a loopback \#2.
AR Activation Request
The downstream device is requested to start the activation procedure.
ARL Activation Request Loop-back
The U-transceiver has detected a loop-back 2 command in the M-channel and has established transparency of transmission in the direction $I O M^{\circledR}$ to U interface. The downstream device is requested to start the activation procedure and to establish a loopback \#2.
DC Deactivation Confirmation Idle code on the $I \mathrm{IO}^{\circledR}-2$ interface.

DR Deactivation Request
The U-transceiver has detected a deactivation request command from the LTside for a complete deactivation. The downstream device is requested to start the deactivation procedure.
RSY Resynchronizing Indication
RSY informs the downstream device that the U-transceiver is not synchronous.

## Signals on U-Interface

The signals U0, U1W, U1A, U1, U3, U5 and SP are transmitted on the U-interface. They are defined in Table 17.

## Signals on $1 O M^{\circledR}-2$

The Data ( $B+B+D$ ) is set to all ' 1 's in all states besides the states listed in Table 13.

## Table 13 Active States

SBC Sychronizing
Wait for INFO U4H
Transparent

## Dependence of Outputs

The M-symbol output in states with valid M-symbol output its value is set according to Table 14

## Table 14 M Symbol Output

| RDS Error | not detected | detected |
| :--- | :--- | :--- |
| M Symbol Output | ' $0 '$ | $'+'$ |

| not received | AR | AR | AI |
| received | ARL | ARL | AIL |

### 2.3.7.6 NT-States

In this section each state is described with its function.

PEF 80902

Functional Description

## Acknowledge Sent / Receive

After having sent the awake signal, the U-transceiver has received the acknowledge wake tone. If being awoken the U-transceiver has sent the acknowledge. In both cases the U-transceiver waits for possible repetition or time-out.

## Awake Signal Sent

The NT has sent out the awake signal U1W and waits now for a response. If the LT does not react in time timer T6 expires and the NT repeats its wake-up call.

## Deactivated

Only in "Deactivated" state the device may enter the power-down mode.

## Deactivating

State Deactivating assures that the C/l-channel code DC is issued four times before entering the 'Deactivated' state.

## IOM ${ }^{\circledR}$ Awaked

The U-transceiver is deactivated, but may not enter the power-down mode.

## Loss of Framing

This state is entered on loss of framing (LOF). No signal is transmitted on the U-interface. A receiver-reset is performed by.
Note that there is no return to the 'Transparent' state that has been possible before in the former IEC-T based state machine.

## Pending Deactivation

The U-transceiver has received U0. The U-transceiver remains at least 0.5 ms in this state before it accepts DI.

## SBC Synchronizing

The NT is now synchronized and indicates this by AR/ARL towards the downstream device. The NT waits for the acknowledge 'Al' from the downstream device.

## Sending Awake-Ack.

On the receipt of the awake signal U2W the U-transceiver responds with the transmission of U1W.

## Functional Description

## Start Awaking Uk0

On the receipt of AR in the C/I-channel the U-transceiver sends the awake signal U1W to start an activation.

## Synchronizing

After the successful awake procedure the U-transceiver trains its receiver coefficients until it is able to detect the signals U2.

## Reset

In state 'Reset' a software-reset is performed.

## Test

State "Test" is entered when the unconditional commands TM2-0='SSP' is applied. The test signal SSP is issued as long as pin SSP is active or $\mathrm{C} / \mathrm{l}=\mathrm{SSP}$ is applied.

## Transparent

The transmission line is fully activated. User data is transparently exchanged by U4/U5. Transparent state is entered in the case of a loopback 2. The downstream device is informed by C/I code AI that the transparent state has been reached
Note that in contrast to the former IEC-T state machine there is no resynchronization mechanism. Once loss of framing (LOF) has been detected a deactivation is initiated.

## Wait for Info U4H

The NT is synchronized and waits now for the permission $(\mathrm{U} 4 \mathrm{H})$ to go to the 'Transparent' state.

### 2.4 S-Transceiver

The S-Transceiver offers the NT state machine described in the User's Manual V3.4 [8].
The S-transceiver basic configurations are performed via pin strapping.

### 2.4.1 Line Coding, Frame Structure

## Line Coding

The following figure illustrates the line code. A binary ONE is represented by no line signal. Binary ZEROs are coded with alternating positive and negative pulses with two exceptions:
For the required frame structure a code violation is indicated by two consecutive pulses of the same polarity. These two pulses can be adjacent or separated by binary ONEs. In bus configurations a binary ZERO always overwrites a binary ONE.

Figure $9 \quad$ S/T -Interface Line Code

## Frame Structure

Each S/T frame consists of 48 bits at a nominal bit rate of $192 \mathrm{kbit} / \mathrm{s}$. For user data (B1+B2+D) the frame structure applies to a data rate of $144 \mathrm{kbit/s}$ (see Figure 9). In the direction TE $\rightarrow$ NT the frame is transmitted with a two bit offset. For details on the framing rules please refer to ITU I. 430 section 6.3. The following figure illustrates the standard frame structure for both directions ( $\mathrm{NT} \rightarrow \mathrm{TE}$ and $\mathrm{TE} \rightarrow \mathrm{NT}$ ) with all framing and maintenance bits.

Figure 10 Frame Structure at Reference Points S and T (ITU I.430)

| - F | Framing Bit | $\mathrm{F}=(\mathrm{Ob}) \rightarrow$ identifies new frame (always positive pulse, always code violation) |
| :---: | :---: | :---: |
| - L. | D.C. Balancing Bit | L . $=(0 \mathrm{~b}) \rightarrow$ number of binary ZEROs sent after the last L . bit was odd |
| - D | D-Channel Data Bit | Signaling data specified by user |
| - E | D-Channel Echo Bit | $\mathrm{E}=\mathrm{D} \rightarrow$ received E -bit is equal to transmitted D-bit |
| - $\mathrm{F}_{\mathrm{A}}$ | Auxiliary Framing Bit | See section 6.3 in ITU I. 430 |
| - N |  | $N=\overline{F_{A}}$ |
| - B1 | B1-Channel Data Bit | User data |
| - B2 | B2-Channel Data Bit | User data |
| - A | Activation Bit | $\begin{aligned} & A=(0 \mathrm{~b}) \rightarrow \text { INFO } 2 \text { transmitted } \\ & A=(1 \mathrm{~b}) \rightarrow \text { INFO } 4 \text { transmitted } \end{aligned}$ |
| -S | S-Channel Data Bit | $\mathrm{S}_{1}$ channel data (see note below) |
| - M | Multiframing Bit | $M=$ (1b) $\rightarrow$ Start of new multi-frame |

Note: The ITU I. 430 standard specifies S1-S5 for optional use.

### 2.4.2 S/Q Channels, Multiframing

The S/Q channels are not supported.

## Functional Description

### 2.4.3 Data Transfer between $I O M^{\circledR}-2$ and $\mathrm{S}_{0}$

In the state G3 (Activated) the B1, B2 and D bits are transferred transparently from the $\mathrm{S} / \mathrm{T}$ to the $I \mathrm{IO}^{\circledR}-2$ interface and vice versa. In all other states '1's are transmitted to the $1 O M^{\circledR}-2$ interface.

### 2.4.4 Loopback 2

$\mathrm{C} / \mathrm{I}$ commands ARL and AIL close the analog loop as close to the S-interface as possible. ETSI refers to this loop under 'loopback 2'. ETSI requires, that B1, B2 and D channels have the same propagation delay when being looped back.
The D-channel Echo bit is set to bin. 0 during an analog loopback (i.e. loopback 2). The loop is transparent.
Note: After C/I-code AIL has been recognized by the S-transceiver, zeros are looped back in the $B$ and $D$-channels (DU) for four frames.

### 2.4.5 State Machine

The state diagram notation is given in Figure 11.
The information contained in the state diagrams are:

- state name
- Signal received from the line interface (INFO)
- Signal transmitted to the line interface (INFO)
- C/I code received (commands)
- C/I code transmitted (indications)
- transition criteria

The transition criteria are grouped into:

- C/I commands
- Signals received from the line interface (INFOs)
- Reset

macro_17.vsd
Figure 11 State Diagram Notation
As can be seen from the transition criteria, combinations of multiple conditions are possible as well. A "*" stands for a logical AND combination. And a " + " indicates a logical OR combination.

## Test Signals

- 2 kHz Single Pulses (TM1)

One pulse with a width of one bit period per frame with alternating polarity.

- 96 kHz Continuous Pulses (TM2)

Continuous pulses with a pulse width of one bit period.
Note: The test signals TM1 and TM2 can be generated via pins TMO-2 according to Table 5.

## Reset States

After an active signal on the reset pin $\overline{\mathrm{RST}}$ the S -transceiver state machine is in the reset state.

## C/I Codes in Reset State

In the reset state the C/I code 0000 (TIM) is issued. This state is entered after a hardware reset (RST).

## C/I Codes in Deactivated State

If the S-transceiver is in state 'Deactivated' and receives $\overline{\mathrm{O}}$, the C/I code 0000 (TIM) is issued until expiration of the 8 ms timer. Otherwise, the C/I code 1111 (DI) is issued.

## Receive Infos on S/T

10
INFO 0 detected
$\overline{10} \quad$ Level detected (signal different to IO)
I3 INFO 3 detected
$\overline{13} \quad$ Any INFO other than INFO 3

## Transmit Infos on S/T

$10 \quad$ INFO 0

I2 INFO 2
$14 \quad$ INFO 4
It Send Single Pulses (TM1).
Send Continuous Pulses (TM2).

### 2.4.5.1 State Machine NT Mode

Figure 12 State Machine NT Mode
Note: By setting the Test Mode pins TM0-2 to '010' / '011': Continuous Pulses / Single Pulses, the S-transceiver starts sending the corresponding test signal, but no state transition is invoked.

PEF 80902

Functional Description

## G1 Deactivated

The S-transceiver is not transmitting. There is no signal detected on the S/T-interface, and no activation command is received in the $\mathrm{C} / \mathrm{I}$ channel. Activation is possible from the S/T interface and from the $1 \mathrm{OM}^{\circledR}-2$ interface.

## G1 $\overline{10}$ Detected

An INFO 0 is detected on the S/T-interface, translated to an "Activation Request" indication in the $\mathrm{C} / \mathrm{I}$ channel. The S-transceiver is waiting for an AR command, which normally indicates that the transmission line upstream is synchronized.

## G2 Pending Activation

As a result of the ARD command, an INFO 2 is sent on the S/T-interface. INFO 3 is not yet received. In case of ARL command, loop 2 is closed.

## G2 wait for AID

INFO 3 was received, INFO 2 continues to be transmitted while the S-transceiver waits for a "switch-through" command AID from the device upstream.

## G3 Activated

INFO 4 is sent on the S/T-interface as a result of the "switch through" command AID: the B and D-channels are transparent. On the command AIL, loop 2 is closed.

## G2 Lost Framing S/T

This state is reached when the transceiver has lost synchronism in the state G3 activated.

## G3 Lost Framing U

On receiving an RSY command which usually indicates that synchronization has been lost on the transmission line, the S-transceiver transmits INFO 2.

## G4 Pending Deactivation

This state is triggered by a deactivation request DR, and is an unstable state. Indication DI (state "G4 wait for DR") is issued by the transceiver when:
either INFO0 is received for a duration of 16 ms
or an internal timer of 32 ms expires.

PEF 80902

## G4 wait for DR

Final state after a deactivation request. The S-transceiver remains in this state until DC is issued.

## Unconditional States

## Test Mode TM1

Send Single Pulses
Test Mode TM2
Send Continuous Pulses

## C/I Commands

| Command | Abbr. | Code | Remark |
| :--- | :--- | :--- | :--- |
| Deactivation Request | DR | 0000 | Deactivation Request. Initiates a complete <br> deactivation by transmitting INFO 0. |
| Reset | RES | 0001 | Reset of state machine. Transmission of <br> Info0. No reaction to incoming infos. RES is <br> an unconditional command. |
| Send Single Pulses | TM1 | 0010 | Send Single Pulses. |
| Send Continuous <br> Pulses | TM2 | 0011 | Send Continuous Pulses. |
| Receiver not <br> Synchronous | RSY | 0100 | Receiver is not synchronous |
| Activation Request | AR | 1000 | Activation Request. This command is used to <br> start an activation. |
| Activation Request <br> Loop | ARL | 1010 | Activation request loop. The transceiver is <br> requested to operate an analog loop-back <br> close to the S/T-interface. |
| Activation Indication | AI | 1100 | Activation Indication. Synchronous receiver, <br> i.e. activation completed. |

Functional Description

| Command | Abbr. | Code | Remark |
| :--- | :--- | :--- | :--- |
| Activation Indication <br> Loop | AIL | 1110 | Activation Indication Loop |
| Deactivation <br> Confirmation | DC | 1111 | Deactivation Confirmation. Transfers the <br> transceiver into a deactivated state in which <br> it can be activated from a terminal (detection <br> of INFO 0 enabled). |

| Indication | Abbr. | Code | Remark |
| :--- | :--- | :--- | :--- |
| Timing | TIM | 0000 | Interim indication during deactivation <br> procedure. |
| Receiver not <br> Synchronous | RSY | 0100 | Receiver is not synchronous. |
| Activation Request | AR | 1000 | INFO 0 received from terminal. Activation <br> proceeds. |
| IIlegal Code Ciolation | CVR | 1011 | Illegal code violation received. This function <br> has to be enabled in S_CONF0.EN_ICV. |
| Activation Indication | AI | 1100 | Synchronous receiver, i.e. activation <br> completed. |
| Deactivation <br> Indication | DI | 1111 | Timer (32 ms) expired or INFO 0 received for <br> a duration of 16 ms after deactivation <br> request. |

## 3 Operational Description

### 3.1 Layer 1 Activation/Deactivation

### 3.1.1 Generation of 4B3T Signal Elements

For control and monitoring purposes of the activation/deactivation progress the following signal elements are defined by TS 102080 and FTZ 1 TR 220.
Table 17 4B3T Signal Elements

| U0 | No signal or deactivation signal that is used in both directions. <br> Downstream, it requests the NT to deactivate. Upstream, the NT <br> acknowledges by U0 that it is deactivated. |
| :--- | :--- |
| U1W, U2W | Awake or awake acknowledge signal used in the awake procedure of the <br> U-interface. |
| The LT sends U2 to enable the own echo canceller to adapt the <br> coefficients. By the Barker code the NT at the other end is enabled to <br> synchronize. The detection of U2 is used by the NT as a criterion for <br> synchronization. <br> The M-channel on U may be used to transfer loop commands. |  |
| U1A | While the NT-RP is synchronizing on the received signal, the LT-RP sends <br> out U2A to enable its echo canceller to adapt the coefficients, but sending <br> no Barker code it inhibits the NT to synchronize on the still asynchronous <br> signal. <br> Due to proceeding synchronization, the U-frame may jump from time to <br> time. U2A can not be detected in the NT at the far end. |
| U1A is similar to U1 but without framing information. While the NT <br> synchronizes on the received signal, it sends out U1A to enable its echo <br> canceller to adapt its coefficients, but sends no Barker code to prevent the <br> LT from synchronizing on the still asynchronous signal. Due to proceeding <br> synchronization, the U-frame may jump from time to time. U1A can not be <br> detected by the far-end LT. |  |
| When synchronized, the NT sends the Barker code and the LT may <br> synchronize itself. U1 indicates additionally that a terminal equipment has <br> not yet activated. Upon receiving U1 the LT indicates the synchronized <br> state by C/I 'UAl' to layer-2. <br> Usually during activation, no U1 signal is detected in the LT because the <br> TE is activated first and U1 changes to U3 before being detected. |  |
| U1 |  |

The M-channel on U may be used to transfer code error indications and 1 kbit/s transparent data.

| Table 17 | 4B3T Signal Elements (cont'd) |
| :--- | :--- |
| U3 | U3 indicates that the whole link to the TE is synchronous in both directions. <br> On detecting U3 the LT requests the NT by U4H to establish a fully <br> transparent connection. <br> The M-channel on U may be used to transfer code error indications and <br> 1 kbit/s transparent data. |
| U4H | U4H requires the NT to go to the 'Transparent' state. On detecting U4H the <br> NT stops sending signal U3 and informs the S-transceiver or a layer-2 <br> device via the system interface. |
| The M-channel on U may be used to transfer loop commands and 1 kbit/s |  |
| transparent data. |  |

Table 18 Generation of the 4B3T Signal Elements

| Upstream <br> (NT to LT) | Downstream <br> (LT to NT) |  | symbols <br> (ternary) | sync <br> word <br> (tern <br> ary) | M <br> sym <br> bol <br> (tern <br> ary) | binary <br> data <br> before <br> scram <br> bling |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| U1W | U2W | Resulting in a tone of: <br> Frequency: 7.5 kHz <br> Duration: 2.13 ms <br> when sending the <br> wakeup tone is finished, <br> signal AWT is set and <br> ternary "0" is sent | 16 times + <br> ++++++ <br> ++----- <br> ---- <br> n/a | n/a | n/a |  |

### 3.1.2 Complete Activation Initiated by Exchange

Figure 13 Activation Initiated by Exchange
Note: The LT starts issuing signal U2 before the NT starts issuing U1A. This chronological order is not displayed for clarification.

PEF 80902

## Operational Description

### 3.1.3 Complete Activation Initiated by TE

Figure 14 Activation Initiated by TE
Note: The LT starts issuing signal U2 before the NT starts issuing U1A. This chronological order is not displayed for clarification.

### 3.1.4 Deactivation

Figure 15 Deactivation (always Initiated by LT)

## Operational Description

### 3.1.5 Activation Procedures with Loopback \#2

Figure 16 Activation of Loopback \#2
Note: Closing/resolving loop 2 may provoke the S-transceiver to resynchronize. In this case, the following C/I-codes are exchanged immediately on reception of AIL/AI, respectively: DU: 'RSY', DU: 'AI', DD: 'AIL'/'AI'.

### 3.2 Layer 1 Loopbacks

Test loopbacks are specified by the national PTTs in order to facilitate the location of defect systems. Four different loopbacks are defined. The position of each loopback is illustrated in Figure 17.

Figure 17 Test Loopbacks
Loopbacks \#1, \#1A and \#2 are controlled by the exchange. Loopback \#3 is controlled locally on the remote side. All four loopback types are transparent. This means all bits that are looped back will also be passed onwards in the normal manner. Only the data looped back internally is processed; signals on the receive pins are ignored. The propagation delay of actually looped $B$ and $D$ channels data must be identical in all loopbacks.

### 3.2.1 Loopback No. 2

The following loopback type belongs to the loopback-\#2 category:

- complete loopback ( $\mathrm{B} 1, \mathrm{~B} 2, \mathrm{D}$ ), in a downstream device

Normally loopback \#2 is controlled by the exchange. The maintenance channel is used for this purpose.

### 3.2.1.1 Complete Loopback

When receiving the request for a complete loopback, the U transceiver passes it on to the S-bus transceiver. This is achieved by issuing the C/I-code AIL in the "Transparent" state or C/I = ARL in states different than "Transparent"

### 3.3 External Circuitry

### 3.3.1 Power Supply Blocking Recommendation

The following blocking circuitry is suggested.

Figure 18 Power Supply Blocking

### 3.3.2 U-Transceiver

The T-SMINTO is connected to the twisted pair via a transformer. Figure 19 shows the recommended external circuitry with external hybrid. The recommended protection circuitry is not displayed.

Figure 19 External Circuitry U-Transceiver with External Hybrid

## U-Transformer Parameters

The following table lists parameters of typical U-transformers.
Table 20 U-Transformer Parameters

| U-Transformer Parameters | Symbol | Value | Unit |
| :--- | :--- | :--- | :--- |
| U-Transformer ratio; <br> Device side : Line side | n | $1: 1.6$ |  |
| Main inductanc of windings on the line side | $\mathrm{L}_{\mathrm{H}}$ | 7.5 | mH |
| Leakage inductance of windings on the line side | $\mathrm{L}_{\mathrm{S}}$ | 120 | $\mu \mathrm{H}$ |
| Coupling capacitance between the windings on <br> the device side and the windings on the line side | $\mathrm{C}_{\mathrm{K}}$ | 30 | pF |
| DC resistance of the windings on device side | $\mathrm{R}_{\mathrm{B}}$ | 0.9 | $\Omega$ |
| DC resistance of the windings on line side | $\mathrm{R}_{\mathrm{L}}$ | 1.8 | $\Omega$ |

# Operational Description 

## Resistors of the External Hybrid R3, R4 and $\mathbf{R}_{\mathbf{T}}$

$\mathrm{R} 3=1.75 \mathrm{k} \Omega$
$\mathrm{R} 4=1.0 \mathrm{k} \Omega$
$R_{\mathrm{T}}=25 \Omega$

## Resistors $\mathbf{R}_{\text {COMP }} / \mathbf{R}_{\mathbf{T}}$

- Optional use of trafos with non negligible resistance $R_{B}, R_{L}$ requires compensation resistors $R_{\text {COMP }}$ depending on $R_{B}$ and $R_{L}$ :

$$
\begin{equation*}
\mathrm{n}^{2} \times\left(2 \mathrm{R}_{\mathrm{COMP}}+\mathrm{R}_{\mathrm{B}}\right)+\mathrm{R}_{\mathrm{L}}=20 \Omega \tag{1}
\end{equation*}
$$

- Compliance with Return Loss Measurements:

$$
\begin{equation*}
\mathrm{n}^{2} \times\left(2 \mathrm{R}_{\mathrm{COMP}}+2 \mathrm{R}_{\mathrm{T}}+\mathrm{R}_{\text {out }}+\mathrm{R}_{\mathrm{B}}\right)+\mathrm{R}_{\mathrm{L}}=150 \Omega \tag{2}
\end{equation*}
$$

$R_{B}, R_{L}$ : see Table 20
$R_{\text {OUT }}$ : see Table 25

## 15nF Capacitor

To achieve optimum performance the $15 n F$ capacitor should be MKT. A Ceramic capacitor is not recommended.

## Tolerances

- Rs: $1 \%$
- $C=15 n F: 10-20 \%$
- $\mathrm{L}_{\mathrm{H}}=7.5 \mathrm{mH}: 10 \%$

### 3.3.3 S-Transceiver

In order to comply to the physical requirements of ITU recommendation 1.430 and considering the national requirements concerning overvoltage protection and electromagnetic compatibility (EMC), the S-transceiver needs some additional circuitry.

PEF 80902

Operational Description

## S-Transformer Parameters

The following Table 21 lists parameters of a typical S-transformer:

## Table 21 S-Transformer Parameters

| Transformer Parameters | Symbol | Value | Unit |
| :--- | :--- | :--- | :--- |
| Transformer ratio; <br> Device side $:$ Line side | n | $2: 1$ |  |
| Main inductance of windings on the line side | $\mathrm{L}_{\mathrm{H}}$ | typ. 30 | mH |
| Leakage inductance of windings on the line side | $\mathrm{L}_{\mathrm{S}}$ | typ. $<3$ | $\mu \mathrm{H}$ |
| Coupling capacitance between the windings on <br> the device side and the windings on the line side | $\mathrm{C}_{\mathrm{K}}$ | typ. $<100$ | pF |
| DC resistance of the windings on device side | $\mathrm{R}_{\mathrm{B}}$ | typ. 2.4 | $\Omega$ |
| DC resistance of the windings on line side | $\mathrm{R}_{\mathrm{L}}$ | typ. 1.4 | $\Omega$ |

## Transmitter

The transmitter requires external resistors $R_{s t x}=47 \Omega$ in order to adjust the output voltage to the pulse mask (nominal 750 mV according to ITU I.430, to be tested with the test mode "TM1") on the one hand and in order to meet the output impedance of minimum $20 \Omega$ on the other hand (to be tested with the testmode 'Continuous Pulses') on the other hand.
Note: The resistance of the S-transformer must be taken into account when dimensioning the external resistors $\mathrm{R}_{\mathrm{stx}}$. If the transmit path contains additional components (e.g. a choke), then the resistance of these additional components must be taken into account, too.

Figure 20 External Circuitry S-Interface Transmitter

## Receiver

The receiver of the S-transceiver is symmetrical. $10 \mathrm{k} \Omega$ overall resistance are recommended in each receive path. It is preferable to split the resistance into two resistors for each line. This allows to place a high resistance between the transformer and the diode protection circuit (required to pass 96 kHz input impedance test of ITU I. 430 [6] and ETS 300012-1). The remaining resistance ( $1.8 \mathrm{k} \Omega$ ) protects the Stransceiver itself from input current peaks.

Figure 21

PEF 80902

### 3.3.4 Oscillator Circuitry

Figure 22 illustrates the recommended oscillator circuit.

Figure 22 Crystal Oscillator
Table 22 Crystal Parameters

| Parameter | Symbol | Limit Values | Unit |
| :--- | :--- | :--- | :--- |
| Frequency | f | 15.36 | MHz |
| Frequency calibration tolerance |  | $+/-60$ | ppm |
| Load capacitance | $\mathrm{C}_{\mathrm{L}}$ | 20 | pF |
| Max. resonance resistance | R 1 | 20 | $\Omega$ |
| Max. shunt capacitance | $\mathrm{C}_{0}$ | 7 | pF |
| Oscillator mode |  | fundamental |  |

## External Components and Parasitics

The load capacitance $C_{L}$ is computed from the external capacitances $C_{L D}$, the parasitic capacitances $\mathrm{C}_{\mathrm{Par}}$ (pin and PCB capacitances to ground and $\mathrm{V}_{\mathrm{DD}}$ ) and the stray capacitance $\mathrm{C}_{\perp \mathrm{O}}$ between XIN and XOUT:

$$
\mathrm{C}_{\mathrm{L}}=\frac{\left(\mathrm{C}_{\mathrm{LD}}+\mathrm{C}_{\mathrm{Par}}\right) \times\left(\mathrm{C}_{\mathrm{LD}}+\mathrm{C}_{\mathrm{Par}}\right)}{\left(\mathrm{C}_{\mathrm{LD}}+\mathrm{C}_{\mathrm{Par}}\right)+\left(\mathrm{C}_{\mathrm{LD}}+\mathrm{C}_{\mathrm{Par}}\right)}+\mathrm{C}_{\mathrm{IO}}
$$

For a specific crystal the total load capacitance is predefined, so the equation must be solved for the external capacitances $\mathrm{C}_{\mathrm{LD}}$, which is usually the only variable to be determined by the circuit designer. Typical values for the capacitances $\mathrm{C}_{\mathrm{LD}}$ connected to the crystal are $22-33 \mathrm{pF}$.

### 3.3.5 General

- low power LEDs

PEF 80902

## 4 Electrical Characteristics

### 4.1 Absolute Maximum Ratings

| Parameter | Symbol | Limit Values | Unit |
| :--- | :--- | :--- | :--- |
| Ambient temperature under bias | $T_{\mathrm{A}}$ | -40 to 85 | ${ }^{\circ} \mathrm{C}$ |
| Storage temperature | $T_{\mathrm{STG}}$ | -65 to 150 | ${ }^{\circ} \mathrm{C}$ |
| Maximum Voltage on $\mathrm{V}_{\mathrm{DD}}$ | $V_{\mathrm{DD}}$ | 4.2 | V |
| Maximum Voltage on any pin with respect to <br> ground | $V_{\mathrm{S}}$ | -0.3 to $\mathrm{V}_{\mathrm{DD}}+3.3$ <br> $(\max .<5.5)$ | V |

ESD integrity (according EIA/JESD22-A114B (HBM)): 2 kV

Note: Stress above those listed here may cause permanent damage to the device. Exposure to absolute maximum ratings conditions for extended periods may affect device reliability.

## Line Overload Protection

The T-SMINT ${ }^{\circledR} \mathrm{O}$ is compliant to ESD tests according to ANSI / EOS / ESD-S 5.1-1993 (CDM), EIA/JESD22-A114B (HBM) and to Latch-up tests according to JEDEC EIA / JESD78. From these tests the following max. input currents are derived (Table 23):

Table 23 Maximum Input Currents

| Test | Pulse Width | Current | Remarks |
| :--- | :--- | :--- | :--- |
| ESD | 100 ns | 1.3 A | 3 repetitions |
| Latch-up | 5 ms | $+/-200 \mathrm{~mA}$ | 2 repetitions, respectively |
| DC | -- | 10 mA |  |

PEF 80902

### 4.2 DC Characteristics

| Digital Pins | Parameter | Symbol | Limit Values |  | Unit | Test Condition |

## Electrical Characteristics

1) Requirement ITU-T I.430, chapter 8.5.1.1a): 'At all times except when transmitting a binary zero, the output impedance, in the frequency range of 2 kHz to 1 MHz , shall exceed the impedance indicated by the template in Figure 11. The requirement is applicable with an applied sinusoidal voltage of 100 mV (r.m.s value)'
2) Requirement ITU-T I.430, chapter 8.5.1.1b): 'When transmitting a binary zero, the output impedance shall be $>20 \Omega$.': Must be met by external circuitry.
3) Requirement ITU-T I.430, chapter 8.5.1.1b), Note: 'The output impedance limit shall apply for a nominal load impedance (resistive) of $50 \Omega$. The output impedance for each nominal load shall be defined by determining the peak pulse amplitude for loads equal to the nominal value $+/-10 \%$. The peak amplitude shall be defined as the the amplitude at the midpoint of a pulse. The limitation applies for pulses of both polarities.'

Table 25 U-Transceiver Characteristics

|  | Limit Values |  |  | Unit |

| Min. operating voltage | $\mathrm{V}_{\mathrm{DDmin}}$ | 1.5 |  |  | V |  |

PEF 80902

## Electrical Characteristics

$\mathrm{V}_{\mathrm{DD}}=3.3 \mathrm{~V} \pm 5 \% ; \mathrm{V}_{\mathrm{SS}}=0 \mathrm{~V} ; \mathrm{T}_{\mathrm{A}}=-40$ to $85^{\circ} \mathrm{C}$

| Parameter | Symbol | Limit Values |  |  | Unit | Test Condition |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- |
|  |  | min. | typ. | max. |  |  |
| Delay for activation <br> of $\overline{\text { RSTO }}$ | $\mathrm{t}_{\text {ACT }}$ |  |  | 10 | $\mu \mathrm{~s}$ |  |
| Delay for deactivation <br> of $\overline{\text { RSTO }}$ | $\mathrm{t}_{\text {DEACT }}$ |  | 64 |  | ms |  |

1) The Detection Threshold $\mathrm{V}_{\mathrm{DET}}$ is far below the specified supply voltage range of analog and digital parts of the T-SMINT ${ }^{\circledR}$. Therefore, the board designer must take into account that a range of voltages is existing, where neither performance and functionality of the $\mathrm{T}-$ SMINT $^{\circledR}$ are guaranteed, nor a reset is generated.
${ }^{2)}$ If the integrated Power-On Reset of the T-SMINTO is selected ( $\overline{\mathrm{VDDDET}}={ }^{\prime} 0^{\prime}$ ) and the supply voltage $\mathrm{V}_{\mathrm{DD}}$ is ramped up from 0 V to $3.3 \mathrm{~V}+/-5 \%$, then the $T$-SMINTO is kept in reset during $\mathrm{V}_{\mathrm{DD} \min }<\mathrm{V}_{\mathrm{DD}}<\mathrm{V}_{\mathrm{DET}}+\mathrm{V}_{\text {Hys }}$. $\mathrm{V}_{\mathrm{DD}}$ must be ramped up so slowly that the T-SMINTO leaves the reset state after the oscillator circuit has already finished start-up. The start-up time of the oscillator circuit is typically in the range between 3ms and 12 ms .

PEF 80902

## $5 \quad$ Package Outlines

Appendix: Differences between Q- and T-SMINT,0

## 6 Appendix: Differences between Q- and T-SMINT ${ }^{\circledR} \mathbf{O}$

The Q- and T-SMINT ${ }^{\circledR} \mathrm{O}$ have been designed to be as compatible as possible. However, some differences between them are unavoidable due to the different line codes 2B1Q and 4B3T used for data transmission on the $\mathrm{U}_{\mathrm{k} 0}$ line.
Especially the pin compatibility between Q- and T-SMINT ${ }^{\circledR} \mathrm{O}$ allows for one single PCB design for both series with only some mounting differences.

The following chapter summarizes the main differences between the Q- and T$\mathrm{SMINT}{ }^{\circledR} \mathrm{O}$.

### 6.1 Pinning

### 6.1.1 Pin Definitions and Functions

Table 29 Pin Definitions and Functions

| Pin MQFP-44 | Q-SMINT ${ }^{\text {® }}$ O: 2B1Q | T-SMINT ${ }^{\text {® }}$ O: 4B3T |
| :---: | :---: | :---: |
| 10 | Triple-Last-Look (TLL) | Tie to '1' |
| 11 | Metallic Termination Input (MTI) | Tie to ' 1 ' |
| 16 | Auto U Activation (AUA) | Tie to '1' |
| 17 | Cold Start Only (CSO) | Tie to '1' |
| 38 | Power Status (primary) (PS1) | Tie to '1' |
| 26 | Power Status (secondary) (PS2) (PS2) | Tie to '1' |

### 6.1.2 LED Pin ACT

The 4 LED states (off, fast flashing, slow flashing, on), which can be displayed with pin $\overline{\mathrm{ACT}}$, are slightly different for Q - and $\mathrm{T}-\mathrm{SMINT}^{\circledR} \mathrm{O}$ (see Table 30).

Table $30 \quad \overline{\text { ACT States }}$

| LED States | Pin $\overline{\text { ACT }}$ |  |
| :--- | :--- | :--- |
|  | Q-SMINT ${ }^{\circledR}$ O: 2B1Q | T-SMINT ${ }^{\circledR}$ O: 4B3T |
| off | $\mathrm{V}_{\mathrm{DD}}$ | $\mathrm{V}_{\mathrm{DD}}$ |
| fast flashing | $8 \mathrm{~Hz}(1: 1)^{\star}$ | $2 \mathrm{~Hz}(1: 1)^{\star}$ |

Appendix: Differences between Q- and T-SMINT,0

### 6.3 External Circuitry

The external circuitry of the Q- and $\mathrm{T}-\mathrm{SMINT}{ }^{\circledR} \mathrm{O}$ is equivalent; however, some external components of the U-transceiver hybrid must be dimensioned different for 2B1Q and 4B3T. All information on the external circuitry is preliminary and may be changed in future documents.

Figure 31 External Circuitry Q- and T-SMINT ${ }^{\circledR} \mathbf{O}$
Note: the necessary protection circuitry is not displayed in Figure 31.
Table 33 Dimensions of External Components

| Component | Q-SMINT ${ }^{\circledR}$ O: 2B1Q | T-SMINT ${ }^{\circledR}$ O: 4B3T |
| :--- | :--- | :--- |
| Transformer: | $1: 2$ | $1: 1.6$ |
| Ratio | 14.5 mH | 7.5 mH |
| Main Inductivity | $1.3 \mathrm{k} \Omega$ | $1.75 \mathrm{k} \Omega$ |
| Resistance | $1.0 \mathrm{k} \Omega$ | $1.0 \mathrm{k} \Omega$ |
| Resistance | $9.5 \Omega$ | $25 \Omega$ |
| Resistance | 27 nF | 15 nF |
| Capacitor C | $2 \mathrm{R}_{\text {PTC }}+8 \mathrm{R}_{\mathrm{Comp}}=40 \Omega$ | $\mathrm{n}^{2} \times\left(2 \mathrm{R}_{\mathrm{COMP}}+\mathrm{R}_{\mathrm{B}}\right)+\mathrm{R}_{\mathrm{L}}=20 \Omega$ |
| $R_{\text {PTC }}$ and $\mathrm{R}_{\text {Comp }}$ |  |  |

## Infineon goes for Business Excellence

"Business excellence means intelligent approaches and clearly defined processes, which are both constantly under review and ultimately lead to good operating results.
Better operating results and business excellence mean less idleness and wastefulness for all of us, more professional success, more accurate information, a better overview and, thereby, less frustration and more satisfaction."

Dr. Ulrich Schumacher
http://www.infineon.com

[^0]:    1) Test conditions: 1.4 Vpp differential sine wave as input on $\mathrm{AIN} / \mathrm{BIN}$ with long range (low, critical range).
    2) Versions PEF $8 \times 913$ with enhanced performance of the U-interface are tested with tightened limit values
    3) The percentage of the " 1 "-values in the PDM-signal.
    4) Interpretation and test conditions: The sum of noise and total harmonic distortion, weighted with a low pass filter 0 to 80 kHz , is at least 70 dB below the signal for an evenly distributed but otherwise random sequence of $+3,+1,-1,-3$.
    5) The signal amplitude measured over a period of 1 min . varies less than $1 \%$.
