- Typical values are at $V_{CC} = 2.5\text{V}$, $T_A = 25^\circ\text{C}$ ambient and maximum loading.
- Measured by the voltage drop between A and B pin at indicated current through the switch. ON resistance is determined by the lower of the voltages on the two (A,B) pins.

I_{CC}	Quiescent Power Supply Current	$V_{CC} = \text{Max.}$	$V_{IN} = \text{GND or } V_{CC}$			10	μA

Switching Characteristics over 2.5V Operating Range

Parameters	Description	Conditions	Com		Units
			Min.	Max.	
t_{PLH}, t_{PHL}	Propagation Delay ^(1,2) Ax to Bx, Bx to Cx or Cx to Ax	$C_L = 30\text{pF}$ $R_L = 500\text{-ohm}$		1.0	ns
t_S	Bus Direction Time Sy to Ax or Bx or Cx		1.0	6.5	

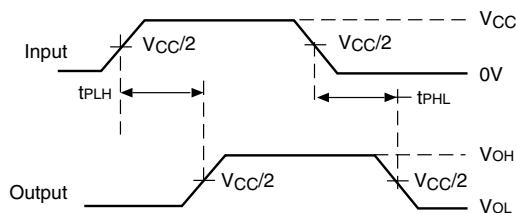

Notes:

1. This parameter is guaranteed but not tested on Propagation Delays.
2. The bus switch contributes little propagational delay other than the RC delay of the ON resistance of the switch and the load capacitance. The time constant for the switch alone is of the order of 1.0ns for 30pF load. Propagation delay of the bus switch when used in a system is determined by the driving circuit on the driving side of the switch and its interaction with the load on the driven side.
