

Optocoupler Solutions

Our broad range of optocoupler solutions combine numerous input and output configurations to reduce power consumption and provide best-in-class noise immunity for your design.

Optocoupler

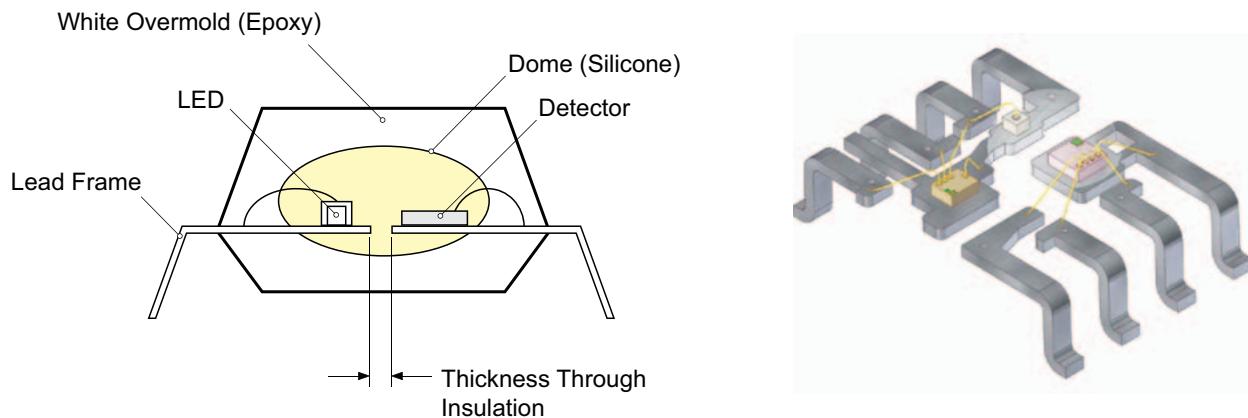

INTRODUCTION

Fairchild Semiconductor is a leader in the design and production of optocouplers. We offer a broad range of package platforms and incorporate various combinations of input and output configurations. Our offerings include simple function optocouplers for low bandwidth/general switching applications, high performance optocouplers for high bandwidth/high gain applications, high voltage optocouplers for AC load switching applications and other specific functions that provide unique performance characteristics.

The Optoplanar® Advantage

Fairchild's comprehensive portfolio of high performance optocouplers offers best-in-class noise immunity as a result from its proprietary coplanar packaging technology, Optoplanar®. The Optoplanar® technology ensures a safe insulation thickness of more than 0.4 millimeters to attain reliable high voltage isolation, certified by UL1577 and DIN EN/IEC60747-5-2 standards.

The new IGBT/MOSFET gate drive optocouplers complement Fairchild's leading discrete power IGBT/MOSFET products. Fairchild customers now have a complete offering from the logic control portion of the circuit to the isolated gate driver to the power MOSFET.

GATE DRIVER OPTOCOUPLES

The FOD31xx IGBT/MOSFET Gate Drive Optocoupler Series provides fast switching specifications allowing designers to use smaller filters, thus reducing overall system power consumption. These high-powered devices can be found in solar inverters, motor drives and induction heating applications. Fairchild's optocouplers offer best-in-class common mode rejection (CMR) making the application more immune to noise. With tight pulse width distortion (65ns) and improved power efficiency, these devices also offer a 1,414V peak working voltage to accommodate switching of 1200V IGBTs. The gate driver output stage comprises of a PMOS and NMOS pair, which facilitates close to rail-to-rail output swing. This feature allows a tight control of the gate voltage during on-state and short-circuit conditions.

These IGBT/MOSFET gate drive optocouplers complement Fairchild's strong, well-established offering in the discrete power IGBT/MOSFET line of products. Fairchild now offers customers one-stop shopping from the logic control portion of the circuit, to the isolated gate driver, to the power IGBT/MOSFET. This combined solution converts the mW to kW providing electrical isolation between the primary and secondary circuits.

Features & Benefits

- Wide operating voltage range of 15V to 30V, high output current capability up to 3.0A
- Use of P-Channel MOSFETs at output stage enables output voltage swing close to the supply rail (rail-to-rail output)
- High common mode transient immunity up to 35kV/ μ s min.
- 5kV isolation voltage rating with >8mm creepage and clearance distance to attain 1,414V (peak) working voltage (UIORM)

HIGH-SPEED LOGIC GATE OPTOCOUPERS

The 3.3V/5V high-speed logic gate optocouplers support isolated communications between systems without conducting ground loops or hazardous voltages. Each high-speed optocoupler utilizes Fairchild's patented coplanar packaging technology, Optoplanar® and optimized design. This achieves excellent noise immunity, characterized by high common mode transient immunity and power supply rejection specifications, and allows these devices to operate in noisy industrial environments (100% better than our closest competitors).

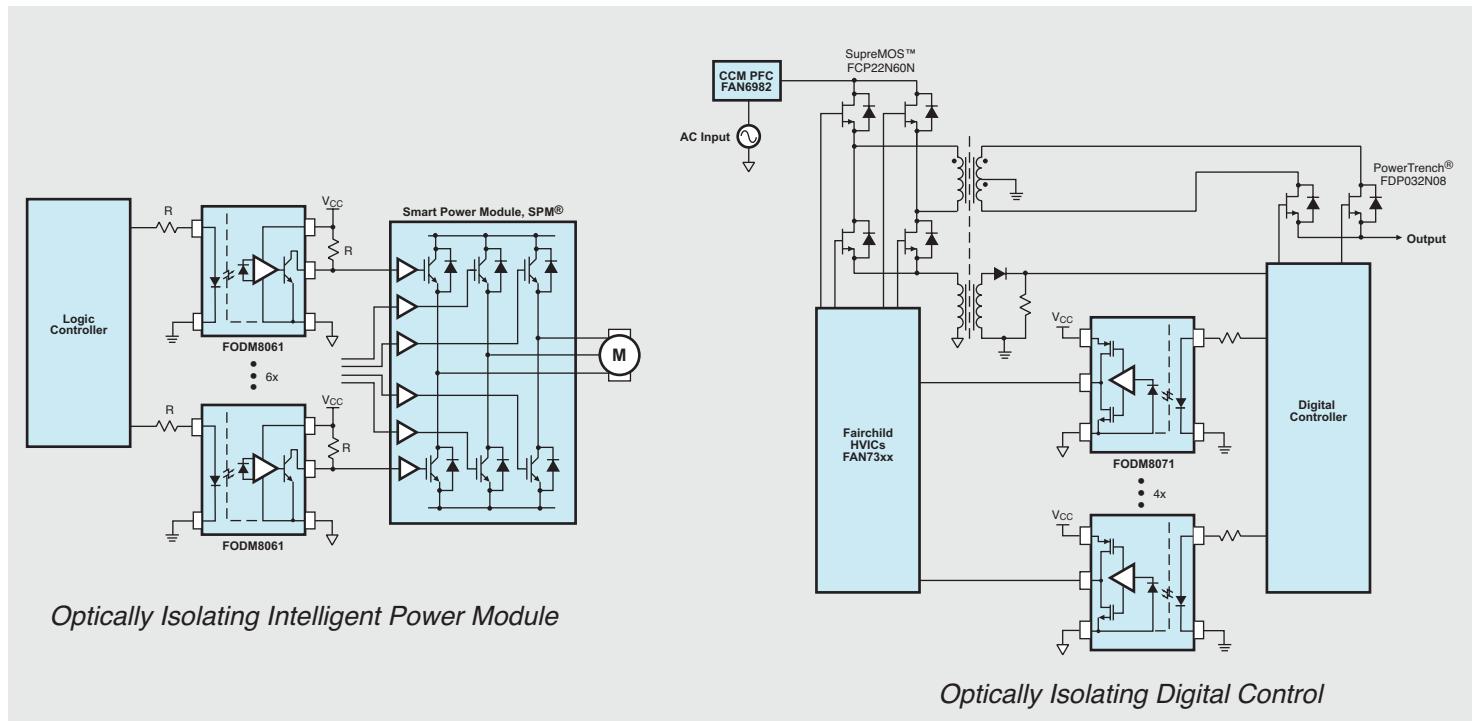

By combining the reliable isolation, high integration of 2 optocoupler channels in bi-directional configuration, the newly released FOD8012 allows system engineers to design a robust system, with low transmission error rate and low system failure rate. This solution provides a proven reliability over extended periods of time required for industrial systems, at a low cost of design and component.

Features & Benefits

- Excellent noise immunity characterized by common mode transient immunity (CMTI) and power supply rejection (PSR) specifications
- High bandwidth up to 25Mbps and 6ns pulse width distortion
- Dual supply voltages, 3.3V and 5V, enabling CMOS and level translation capabilities
- Electrical characteristics guaranteed beyond the full industrial temperature range (-40°C to +110°C)
- UL1577 (3,750 VACRMS for 1 min) and DIN EN/IEC60747-5-2 certified for increased reliability
-

SNUBBERLESS TRIAC DRIVE OPTOCOUPLES

The Snubberless TRIAC Drive Optocouplers feature a built-in active dv/dt clamp providing best-in-class noise immunity (dv/dt) of $10,000V/\mu s$, which is superior to the average dv/dt rating ($1,500V/\mu s$) of monolithic TRIAC drivers. This superior performance eliminates the RC snubber network required for lower dv/dt -rated monolithic opto TRIAC drivers. This saves valuable design time and reduces bill of materials (BOMs). High noise immunity makes these products ideal for noisy industrial environments as they offer a more robust solution for isolating solid-state relays, AC motor controls and lighting ballasts. The FOD41XX family features an integrated zero-cross inhibit circuit which prevents the device from switching near the peak of the AC mains. The FOD42XX are random phase drivers which allow the device to switch at any AC mains voltage level.

Features & Benefits

- High static and commutating dv/dt immunity ($10kV/\mu s$ minimum) eliminates the need for a snubber circuit
- High blocking voltage of $800V$ minimum
- Low input current of $1.3mA$ maximum reduces power consumption
- Elimination of the snubber circuit significantly reduces standby power
- High isolation voltage of $5000VAC_{RMS}$ minimum, 1 minute duration
- High maximum on-state current rating of $300mA$
- Lead-free and RoHS compliant
- UL, C-UL and IEC60747-5-2 approved
