## Reed Switch <br> Standard \& Miniafure Switches

- Controlled switching environment.
- Low contact resistance variants.
- High power
applications.
- High voltage.

A family of form ' A ' reed switches produced with Rhodium contact material, designed to range from moderate currents and voltages through to high voltage, high current switching.

## Reed Switch

## Sub Miniature \& Tiny Switches

## FormA

These tiny reed switches are designed for low power and high speed switching with maximum sensitivity. Their extremely small size make them ideal for Dual In Line packages, or magnet operation.

Form A

- Small physical size.
- Centre or offset contact configurations.
- High speed switching.

## Reed Operating Coils

Operating coils for Standard and Miniature size reed switches are available for customer assembly of Reed Relays. Coils are made in two widths to take wither one or two reed switches.
Crydom Magnetics specialise in producing custom designs, so other variations and options may be available to suit particular requirements.
Details of Crydom Magnetics Reed Switches are listed on separate sheets, available on request.

## Permanent Magnets for Reed Switch Operation

A range of magnets is available for operating the Crydom Magnetics range of reed switches. The selection of the correct combination of magnets and reeds switches, for a particular application, will normally be made on an empirical basis as intricate calculations are not necessary.

The following table of magnet types and accompanying graphs act as a guide to the relationship between switch sensitivity and magnet type. These figures can only be taken as a rough indication, due to the fact that magnets are manufactured to commercial tolerances.

Details of Crydom Magnetics Reed Switches are listed on separate sheets, available on request.
Magnet Types

| Type <br> Number | Nominal Dimensions mm/ins |  |  |  |  |  | Total Magnetic Flux |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Length 'A' |  | Length 'B' |  | Length 'C' |  |  |
|  | mm | inches | mm | inches | mm | inches | $\mu \mathrm{Wb}$ |
| RSHOI | 12.7 | 0.5 | 3.2 | 0.125 | 1.6 | 0.063 | 4.0 |
| RSH02 | 31.7 | 1.25 | 6.4 | 0.25 | 6.4 | 0.25 | 28 |
| RSH32 | 27.9 | 1.10 | 4.8 | 0.187 | 4.8 | 0.187 | 22 |
| RSH33 | 19.1 | 0.75 | 3.2 | 0.125 | 3.2 | 0.125 | 9 |
| RSH34 | 25.4 | 1.00 | 6.4 | 0.25 | 6.4 | 0.25 | 30 |
| RSH73 | 12.7 | 0.5 |  | 0.125 |  |  | 5.5 |
| RSH74 | 52.9 | 2.08 | 10.2 | 0.40 |  |  | 71 |

All of these magnets are polarised along their length.

Actuation of Reed Switches with a

Direct Actuation:
A magnet moved perpendicularly towards and away from a Reed Switch turnsiton and off once.

A magnet moved parallel to a Reed
Switch operates if from one to three
times.

A magnet swung towards and away from a Reed Switch operates it once.

Rotation:
Examples of swithhing through rotational movement:

Indirect Actuation: Shielding
With the stationary arrangement of a Reed Switch and magnet, the reed contacts are closed. Should the magnetic field be diverted away from the Reed Switch by a shield of ferro-magnetic material placed between the switch and the magnet, the contacts will open. When the shield is removed, the reed contacts become magnetically actuated and close.

A ring magnet moved parallel to the Reed Switch axis operates it from one to three times.

## Reed Switch

## Application Notes

Capacitive Loads
Unlike inductive loads, capacitive and lamp loads are prone to high inrush currents which can lead to faulty operation and even contact welding. When switching charged capacitors (including cable capacitance) a sudden unloading can occur, the intensity of which is determined by the capacity and length of the connecting leads to the switch. This inrush peak can be reduced by a series of resistors. The value of these resistors is dependent on the particular application but should be as high as possible to ensure that the inrush current is within the allowable limits.

The diagram illustrates a resistor/capacitor network for protecting a Reed Switch against high inrush currents. R1 and/or R2 are used depending upon circuit conditions.

With lamp load applications it is important to note that cold lamp filaments have a resistance 10 times smaller than already glowing filaments. This means that when being turned-on, the lamp filament experiences a current flow 10 times greater than when already hot. This high inrush current can be reduced to an acceptable level through the use of a series of currentlimiting resistors. Another possibility is to fit a resistor across the switch. This allows just enough current to flow through the filament to keep it warm, yet not enough to make it glow.

Lamp load with parallel or current limiting resistor across the switch

## Cutting and Bending

As the Reed Switch blades form part of a magnetic circuit, shortening the leads results in increased pull-in and drop-out values.

When cutting or bending Reed Switches, it is important that the glass body is not damaged. Therefore, the cutting or bending point should be no closer than 3 mm to the glass body and the leads should be supported when cutting or bending as shown.

Actuation of Reed Switches with a Permanent Magnet Examples of swithing with the use of a moving magnet

Direct Actuation:
A magnet moved perpendicularly towards and away from a Reed Switch turns it on and off once.

A magnet moved parallel to a Reed Switch operates it from one to three times.

A magnet swung towards and away from a Reed Switch operates it once.

A ring magnet moved parallel to the Reed Switches axis operates it from one to three times.

Rotation:
Examples of switching through rotational movement:

Indirect Actuation: Shielding
With the stationary arrangement of a Reed Switch and magnet, the reed contacts are closed. Should the magnetic field be diverted away from the Reed Switch by a shield of ferro-magnetic material placed between the switch and the magnet, the contacts will open. When the shield is removed, the reed contacts become magnetically actuated and close.

## Permanent Magnet areas of Operation

## Magnets

The materials used for Reed Switch magnets are generally ALNICO (an aluminium nickel cobalt alloy), ceramic (barium ferrite or another metal oxide) or rare earth magnets. Due to their specific magnetic characteristics, the types of magnets differ in shape: ALNICO magnets are bar magnets with a length/diameter ratio of $3 / 1$ to $5 / 1$; oxide magnets are generally disc or moulded magnets. Also important to note is the difference in temperature coefficient:
ALCO: $0.02 \% / K$, oxide: $0.2 \% / K$

## In General:

The sensitivity of a reed switch is a measurement of the magnetic energy required to operate the switch. The unit of measurement is Ampere-Turns(AT), which is the current in a given coil multiplied the number of furns on that coil.

Manufacturers of reed swithes will set their machines such that they aim to produce a particular operate AT but, due to tolerances in materials, machinery and operator control, the switches produced will have a range of operate AT. The reed switches are then measured and sorted into bands of AT, and stocked in those bands.

For each Reed Switch type the available range of operate sensitivity is given in the data table.
Other operate sensitivities are available on request.

## Life Expectancy:

The life expectancy of a Reed Swith is about $10^{5}$... $10^{6}$ switching cycles with maximum power. With a low load the life expectancy can reach $5 \times 10^{8}$ operations. The mechanical life expectancy can reach at least $10^{9}$ operations. The Life Expectancy is considerably reduced, through the switching of Inductive, Capacitive and Lamp loads, due to the maximum current being exceeded.

Pull In Sensitivity Tolerance:
The given operate sensitivity of the Reed Switch has a test equipment tolerance of $\pm 2$ AT.

## Part Number system

## Example:

DRA282G $=$ Standard size - Rhodium contact - N/0 - Non-pressurised - High Power Contact - Operate Sensitivity 60 - 70 AT.
