

DS90CF383 +3.3V LVDS Transmitter 24-Bit Flat Panel Display (FPD) Link—65 MHz

General Description

The DS90CF383 transmitter converts 28 bits of CMOS/TTL data into four LVDS (Low Voltage Differential Signaling) data streams. A phase-locked transmit clock is transmitted in parallel with the data streams over a fifth LVDS link. Every cycle of the transmit clock 28 bits of input data are sampled and transmitted. At a transmit clock frequency of 65 MHz, 24 bits of RGB data and 3 bits of LCD timing and control data (FPLINE, FPFRAME, DRDY) are transmitted at a rate of 455 Mbps per LVDS data channel. Using a 65 MHz clock, the data throughputs is 227 Mbytes/sec.

This chipset is an ideal means to solve EMI and cable size problems associated with wide, high speed TTL interfaces.

Applications Information

The DS90CF383 and DS90CF384 are backward compatible with the existing 5V FPD Link transmitter/receiver pair (DS90CF583 and DS90CF584). To upgrade from a 5V to a 3.3V system the following must be addressed:

1. Change 5V power supply to 3.3V. Provide this supply to the V_{CC}, LVDS V_{CC} and PLL V_{CC} of both the transmitter

and receiver devices. This change may enable the removal of a 5V supply from the system, and power may be supplied from an existing 3V power source.

2. The DS90CF383 transmitter input and control inputs accept 3.3V TTL/CMOS levels. They are not 5V tolerant.
